"Let him look for something nearer home." Cervantes profere remained at his post; the work was hard, uncongenial and ill-paid, and the salary was in constant arrears. In November 1590 he was in such straits that he borrowed money to buy himself a suit of clothes, and in August 1592 his sureties were called upon to make good a deficiency of 795 reales in his accounts. His thoughts turned to literature once more, and on the 5th of September 1592, he signed a contract with Rodrigo Osorio undertaking to write six plays at fifty ducats each, no payment to be made unless Osorio considered that each of these pieces was one of the best ever produced in Spain. Nothing came of this agreement, and it appears that, between the date of it and the time that the promised payment was due, Cervantes (for reasons unknown to us) at Castro del Río. He was speedily released, and continued to perquisition as before in Andalusia; but his literary ambitions were not dead, and in May 1595 he won the first prize—three silver spoons—at a poetical tourney held in honour of St Hyacinth at Saragossa. Shortly afterwards Cervantes found himself in difficulties with the exchequer officials. He entrusted a sum of 7400 reales to a merchant named Simón Freire de Lima with instructions to pay the amount into the treasury at Madrid; the agent became bankrupt and absconded, leaving Cervantes responsible for the debt. By some means the money was raised, and the debt was liquidated on the 21st of January 1597. But Cervantes' position was shaken, and his unbusinesslike habits lent themselves to misinterpretation. On the 6th of September 1597 he was ordered to find sureties that he would present himself at Madrid within twenty days, and there submit to the exchequer vouchers for all official moneys collected by him in Grahada and elsewhere. Nothing more of these being available, he was committed to Seville jail, but was released on the 1st of December on the condition that he complied with the original order of the court within thirty days. He was apparently unable to find bail, was dismissed from the public service, and sank into extreme poverty. During a momentary absence from Seville in February 1599, he was again summoned to Madrid by the treasury, but does not appear to have obeyed: it is only too likely that he had not the money to pay for the journey. There is some reason to think that he was imprisoned at Seville in 1602, but nothing positive is known of his existence between 1600 and the 8th of February 1603: at the latter date he seems to have been at Valladolid, to which city Philip III. had removed the court in 1601.

Since the publication of the *Galatea* in 1585 Cervantes'
CERVANTES

contributions to literature had been limited to occasional poems. In 1591 he published a ballad in Andrés de Villalba’s Flor de varios y nuevos romances; in 1593 he composed a poem, already mentioned, to celebrate the canonization of St Hyacinth; in 1596 he wrote a sonnet ridiculing Medina Sidonia’s tardy entry into Cádiz after the English invaders had retired; and in the same year his sonnet lauding Santa Cruz was printed in Cristóbal Mosquera de Figueroa’s Comentario en breve compendio de disciplina militar; to 1597 is assigned a sonnet (the authenticity of which is disputed) commorative of the poet Herrera; in 1598 he wrote two sonnets and a copy of quinitillas on the death of Philip II.; and in 1602 a complimentary sonnet from his pen appeared in the second edition of Lope de Vega’s Dragonea. Curiously enough, it is by Lope de Vega that Don Quixote is first mentioned. Writing to an unknown correspondent (apparently a physician) on the 14th of August 1604, Lope de Vega says that he no longer acted as Cervantes, nor proceeded to praise Don Quixote,” and he goes on to speak of his own plays as being odious to Cervantes. It is obvious that the two men had quarrelled since 1602, and that Lope de Vega smarted under the satire of himself and his works in Cervantes’ forthcoming book; Don Quixote may have been circulated in manuscript, or may even have been printed before the official licence was granted on the 26th of September 1604. It was published early in 1605, and was dedicated to the seventh duke de Béjar in phrases largely borrowed from the dedication in Herrera’s edition (1586) of Garcilaso de la Vega, and from Francisco de Medina’s preface to that work.

The mention of Bernardo de la Vega’s Pastor de Iberia shows that the sixth chapter of Don Quixote cannot have been written before 1591. In the prologue Cervantes describes his masterpiece as being “just what might be begotten in a jail”; on the strength of this passage, it has been thought that he conceived the story, and perhaps began writing it, during one of his terms of imprisonment at Seville between 1597 and 1602. Within a few weeks of its publication at Madrid, three pirated editions of Don Quixote were issued at Lisbon; a second authorized edition, imperfectly revised, was hurried out at Madrid; and another reprint appeared at Valencia with an aprobarhon taken 18th July 1605. With the exception of Alemán’s Guarnés de Alarache, no Spanish book of the period was more successful. Modern criticism is prone to regard Don Quixote as a symbolic, didactic or controversial work intended to bring about radical reforms in church and state. Such interpretations did not occur to Cervantes’ contemporaries, nor to Cervantes himself. There is no reason for rejecting his plain statement that his main object was to ridicule the romances of chivalry, which in their latest developments had become a tissue of tiresome absurdities. It seems clear that his first intention was merely to parody these extravagances in a manner that would promote the immense possibilities of the subject became more evident to him, and he ended by expanding his work into a brilliant panorama of Spanish society as it existed during the 16th century. Nobles, knights, poets, courtly gentlemen, priests, traders, farmers, barbers, muleteers, scullions and convicts; accomplished ladies, impromptu damsels, Moorish beauties, simple-hearted country-girls and kindly kitchen-wench’s of questionable morals—all these are presented with the genial fidelity which comes of sympathetic insight. The immediate vogue of Don Quixote was due chiefly to its variety of incident, to its wealth of comedy bordering on farce, and perhaps also to its keen thrusts at eminent contemporaries; its reticent pathos, its large humanity, and its penetrating criticism of life were less speedily appreciated.

Meanwhile, on the 12th of April 1605, Cervantes authorized his publisher to proceed against the Lisbon booksellers who threatened to introduce their piratical reprints into Castile. By June the citizens of Valladolid already regarded Don Quixote and Sancho Panza as proverbial types. Less gratifying experiences awaited the popular author. On the 27th of June 1605 Gaspar de Espelets, a Navarrese gentleman of dissolute life, was wounded outside the lodging-house in which Cervantes and his family lived; he was taken indoors, was nursed by Cervantes’ sister Magdalena, and died on the 29th of June. That same day Cervantes, his natural daughter (Isabel de Saavedra), his sister Andrea and her daughter were lodged in jail on suspicion of being indirectly concerned in Espeleta’s death; one of the witnesses made damaging charges against Cervantes’ daughter, but no substantial evidence was produced, and the prisoners were released. Little is known of Cervantes’ life between 1605 and 1608. A Relación of the festivities held to celebrate the birth of Philip IV., and a certain Carta a don Diego Astrildillo Carrillo have been erroneously ascribed to him; during these three years he apparently wrote nothing beyond three sonnets, and one of these is of doubtful authenticity. The depictions of the Valladolid enquiry show that he was living in poverty five months after the appearance of Don Quixote, and the fact that he borrowed 450 reales from his publisher before November 1607 would convey the idea that his position improved slowly, if not difficultly to reconcile with the unimpassioned, with the details concerning his illegitimate daughter revealed in documents recently discovered. Isabel de Saavedra was stated to be a spinner when arrested at Valladolid in June 1605; the settlement of her marriage with Luis de Molina in 1608 describes her as the widow of Diego Sanz, as the mother of a daughter eight months old, and as owning house-property of some value. These particulars are perplexing, and the situation is further complicated by the publication of a deed in which Cervantes declares that he himself is the real owner of this house-property, and that his daughter has merely a life-interest in it. This claim may be regarded as a legal fiction; it cannot be reconciled with Cervantes’ statement towards the end of his life, that he was dependent on the bounty of the count of Lemos and of Bernardo de Sandoval, cardinal-archbishop of Toledo. In 1606 he joined the newly founded confraternity of the Slaves of the Most Blessed Sacrament; in 1609 he was appointed viceroy of Nules and Cervantes was keenly disappointed at not being chosen to accompany his patron. In 1611 he lost his sister Magdalena, who was buried by the charity of the Tertullians of Saint Francis; in 1612 he joined the Academia Selvaje, and there appears to have renewed his former friendly relations with Lope de Vega; in 1613 he dedicated his Novelas ejemplares to the count of Lemos, and disposed of his rights for 1600 reales and twenty-four copies of the book. The twelve tales in this volume, some of them written very much later than others, are of unequal merit, but they contain some of the writer’s best work, and the two picaro stories—Rinconete y Cortadillo and the Colloquio de los perros—are superb examples of their kind, and would alone entitle Cervantes to take rank with the greatest masters of Spanish prose. In 1614 he published the Viaje del Parnaso, a burlesque poem suggested by the Viaggio in Parnaso (1582) of the Peruvian poet Cesare Caporali. It contains some interesting autobiographical passages, much harryery of con-

temporary poetaysters, and a few happy satirical touches; but, though it is Cervantes’ most serious bid for fame as a poet, it has seldom been reprinted, and would probably have been forgotten but for an admirably humorous postscript in prose which is worthy of the author at his best. In the preface to his Ocho comedias y ocho entremeses nuevos (1615) he good-humoredly admits that his dramatic works found no favour with managers, and when this collection was first reprinted (1749), the editor advanced the fantastic theory that the comedias were deliberate exercises in absurdity, intended to parody the popular dramas of the day. This view cannot be maintained, but a sharp distinction must be drawn between the eight set plays and the eight interludes; with one or two exceptions, the comedias or set plays are unsuccessful experiments in Lope de Vega’s manner, while the entremeses or interludes, particularly those in prose, are models of spontaneous gaiety and ingenious wit.

In the preface to the Novelas ejemplares Cervantes had announced the speedy appearance of the sequel to Don Quixote which he had vaguely promised at the end of the first part. He was at work on the fifty-ninth chapter of his continuation when he learned that he had been anticipated by Alonso Fernandez de Avellaneda of Tordesillas, whose Segundo tomo del ingenioso
hidalgo don Quijote de la Mancha was published at Tarragona in 1614. On the assumption that Fernández de Avellaneda is a pseudonym, this spurious sequel has been ascribed to the king's confessor, Luis de Aliaga, to Cervantes' old enemy, Blanco de Paz, to his old friend, Bartolomé Leonardo de Argensola, to the three great dramatists, Lope de Vega, Tirso de Molina and Ruiz de Alarcón, to Alonso Fernandez, to Juan José Martí, to Alfonso Lambertu, to Luis de Granada, and probably to others. Some of these attributions are manifestly absurd—for example, Luis de Granada died seventeen years before the first part of Don Quijote was published—and all of them are improbable conjectures; if Avellaneda be not the real name of the author, his identity is still undiscovered. His book is not devoid of literary talent and robust humour, and possibly he began it under the impression that Cervantes was no more likely to finish Don Quijote than to finish the Galatea. He should, however, have abandoned his project on reading the announcement in the preface to the Novelas exemplares; what he actually did was to disgrace himself by writing an insolent preface taunting Cervantes with his physical defects, his mortal infirmities, his age, his illnesses and his losses in jail. It was too much to expect that his continuation could hold its own against the authentic sequel, and malignantly avowed his intention of being first in the field and so spoiling Cervantes' market. It is quite possible that Don Quijote might have been left incomplete but for this insulting intrusion; Cervantes was a leisurely writer and was, as he states, engaged on El Engaño á los, Las Semanas del Jardín and El Famoso Bernardo, none of which have been preserved. Avellaneda forced him to concentrate his attention on his masterpiece, and the authentic second part of Don Quijote appeared towards the end of 1615. No book more signally contradicts the maxim, quoted by the Bachelor Carrasco, that "no second part was ever good." It is true that the last fourteen chapters are damaged by undignified denunciations of Avellaneda; but, apart from this, the second part of Don Quijote is an improvement on the first. The humour is more subtle and mature; the style is of more even excellence; and the characters of the bachelor and of the physician, Pedro Rincón de Agüero, are presented with a more vivid effect than any of the secondary characters in the first part. Cervantes had clearly profited by the criticism of those who objected to "the countless cudgellings inflicted on Señor Don Quijote," and to the irrelevant interpolation of extraneous stories in the text. Don Quijote moves through the second part with untruffled dignity; Sancho Panza loses something of his rustic cunning, but he gains in wit, sense and manners. The original conception is unchanged in essentials, but it is more logically developed, and there is a notable progress in construction. Cervantes had grown to love his knight and squire, and he understood his own creations better than at the outset; more completely master of his craft, he wrote his sequel with the unaltering confidence of a renowned artist bent on sustaining his reputation.

The first part of Don Quijote had been reprinted at Madrid in 1608; it had been produced at Brussels in 1607 and 1611, and at Milan in 1610; it had been translated into English in 1612 and into French in 1613. Cervantes' sequel was celebrated in and out of Spain; his celebrity had not brought him wealth. The members of the French special embassy, sent to Madrid in February 1615, under the Commandeur de Sillery, heard with amazement that the author of the Galatea, the Novelas exemplares and Don Quijote was "old, a soldier, a gentleman and poor." But his trials were almost at an end. Though failing in health, he worked assiduously at Los Trabajos de Persiles y Sigismunda, which, as he had joyously prophesied in the preface to the second part of Don Quijote, would be "either the worst or the best book ever written in our tongue." It is the most carefully written of his prose works, and the least animated or attractive of them; signs of fatigue and of waning powers are unmistakably visible. Cervantes was not destined to see it in print. He was attacked by dropsy, and, on the 18th of April 1616, received the sacrament of extreme unction; next day he wrote the dedication of Persiles y Sigismunda to the count de Lemos—the most moving and gallant of farewells. He died at Madrid in the Calle del León on the 23rd of April; he was borne from his house "with his face uncovered," according to the rule of the Tertiaries of St Francis, and on the 24th of April was buried in the church attached to the convent of the Trinitarian nuns in the Calle de Cantarranas. There he rests—the story of his remains being removed in 1633 to the Calle del Humilladero no foundation in fact—but the exact position of his grave is unknown. Early in 1617 Persiles y Sigismunda was published, and passed through eight editions within two years; but the interest in it soon died away, and it was not reprinted between 1625 and 1719.

Cervantes' wife died without issue on the 31st of October 1626; her natural daughter, who survived both the child of her first marriage and her second husband, died on the 20th of September 1652. Cervantes is represented solely by his works. The Novelas exemplares alone would give him the foremost place among Spanish novelists; Don Quijote entitles him to rank with the greatest writers of all time: "children turn its leaves, young people read it, grown men understand it, old folk praise it." It has outlived all changes of literary taste, and is even more popular to-day than it was three centuries ago.

CERVERA, PASCUAL CERVERA Y TOPOTE (1839—1909), Spanish admiral, was born at Medina Sidonia on the 18th of February 1839. He showed an early inclination for the sea, and his family sent him to the naval cadet school at the age of twelve. As a sub-lieutenant he took part in the naval operations on the coast of Morocco during the campaign of 1856—58. Then he was for some time engaged at the port of Isla de Pala in the Philippines. Afterwards he was on the West Indian station during the early part of the first Cuban War (1868—78), returning to Spain in 1873 to serve on the Basque coast against the Carlists. He distinguished himself in defending the Carraca arsenal near Cadiz against the Federales in 1873. He won each step in his promotion up to flag-rank through his steadiness and brilliant conduct in action, and was awarded the crosses of the Orders of Military and Naval Merit, Isabella the Catholic, and St Hermengilde, besides several medals. Cervera had a great reputation for decision, unbounding temper and honesty, before he was placed at the head of the Bilbao building-yards. This post he resigned after a few months in order to become minister of marine in 1892, in a cabinet presided over by Sagasta. He withdrew from the cabinet when he found that his colleagues, from political motives, declined to support him in making reforms, and
on the other hand, unusually cut down the naval estimates. When in 1808 the Spanish-American War (q.v.) broke out, he was chosen to command a squadron composed of four first-class cruisers, the “Maria Theresa,” his flagship, “Quendo,” “Vizcaya,” and “Columbus,” and several destroyers. This ill-fated squadron only started upon its reckless cruise across the ocean after its gallant commander had repeatedly warned both the minister of marine and the prime minister, Sagasta, in despatches from Cadiz and from the Canary and Cape Verde Islands, that the ships were insufficiently provided with coal and ammunition. Some of them, indeed, even lacked proper guns. In compliance with the instructions of the government, Admiral Cervera made for the landlocked harbour of Santiago de Cuba, where he co-operated in the defence, landing some guns and a naval brigade. In spite of his energetic representations, Cervera received an order from Madrid, dictated by political considerations, to sail forth. It meant certain destruction. The gallant squadron met forces trebly superior to it, and was totally destroyed. The admiral, three of his captains, and 1800 sailors and marines were taken by the victors to Portsmouth, New Hampshire, U.S.A. After the victor’s entry into New York, he tried before the supreme naval and military court of the realm, which honourably acquitted them all. In 1901 he became vice-admiral, in 1902 was appointed chief of staff of the Spanish navy, and in 1903 was made life senator. He died at Puerto Real on the 3rd of April 1909.

CESAREVICH, or more properly Tsesarevich, the title of the heir-apparent to the Russian throne. The full official title is Naslednik Tsesarevich, i.e. “heir of Caesar,” and in Russia the heir to the throne is commonly called simply Naslednik, the word Tsesarevich never being used alone. Tsesarevich, a form now much used in England, means simply any “king’s son”; it is an antiquated term now out of use in Russia, and was last borne as heir to the throne by the unfortunate Alexis, son of Peter the Great. The style of the wife of the tsesarevich is Tsesarevna. The Cesarewitch handicap race at Newmarket, founded in 1839, was named after the prince who was afterwards Alexander II. of Russia, who paid a state visit to England that year.

CESARI, GIUSEPPE, called II Cavaliere d’Arpino (born in or about 1568 and created a “Cavaliere di Cristo” by Pope Clement VIII.), also named II Giuseppino, an Italian painter, much encouraged at Rome and munificently rewarded. His father had been a native of Arpino, but Giuseppino himself was born in Rome. Cesari is stigmatized by Lanzi as not less the corruptor of taste in painting than Marino was in poetry: indeed, another of the nicknames of Cesari is “Il Marino de’ Pittori” (the pictorial Marino). There was spirit in Cesari’s heads of men and horses, and his frescoes in the Capitol (story of Romulus and Remus, &c.), which occupied him at intervals during forty years, are well coloured; but he drew the human form ill. His perspective is faulty, his extremities monotonous, and his chiaro-oscuro defective. He died in 1642, at the age of seventy-two, or perhaps of eighty, at Rome. Cesari ranks as the head of the “Idealists” of his period, as opposed to the “Naturalists,” of whom Michelangelo da Caravaggio was the leading champion,—the so-called “Idealism” consisting more in reckless facility, and disregard of the common facts and common-sense of nature, than in anything to which so lofty a name could be properly accorded. He was a man of touch and irascible character, rose from penury to the height of opulence. His brother Bernardino assisted in many of his works.

CESAROTTI, MELCHIORE (1739-1808), Italian poet, was born at Padua in 1739, of a noble but impoverished family. At the university of his native place he literary progress procured for him at a very early age the chair of rhetoric, and in 1768 the professorship of Greek and Hebrew. On the invasion of Italy by the French, he gave his pen to their cause, received a pension, and was made knight of the iron crown by Napoleon I., to whom, in consequence, he addressed a bombast and extravagantly flattering poem called Promé. Cesarotti is best known as the translator of Homer and Ossian. Much praise cannot be given to his version of the Iliad, for he has not scrupled to add, omit and modernize. Ossian, which he held to be the finest of poems, he has, on the other hand, considerably improved in translation; and the appearance of his version attracted much attention in Italy and France, and raised up many imitators of the Ossianic style. Cesarotti also produced a number of works in prose, including a Course of Greek Literature, and essays On the Origin and Progress of the Poetic Art, On the Sources of the Pleasure derived from Tragedy, On the Philosophy of Language and On the Philosophy of Taste, the last being a defence of his own great eccentricities in criticism. His weakness was a straining after novelty. His style is forcible, but full of Gallicisms. A complete edition of his works, in 42 vols. 8vo, began to appear at Pisa in 1800, and was completed in 1813, after his death. See Memoirs, by Barbieri (Padua, 1810), and Un Filo so della lettere, by Alemani (Turin, 1894).

CESENA (anc. Caesena), a town and episcopal see of Emilia, Italy, in the province of Forlì, 12 m. S.E. by rail from the town of Forlì, on the line between Bologna and Rimini, 144 ft. above sea-level. Pop. (1905) 12,745 (town); 43,468 (commune). The town is picturesquely situated at the foot of the Apennines, and is crowned by a medieval fortress (Rocca), begun by the emperor Frederick I. (Barbarossa) probably, but altered and added to later. The cathedral has two fine marble altars by the Lombardi of Venice (or their school). The library, built for Domenico Malatesta in 1452 by Matteo Nuzio, is a fine early Renaissance building, and its internal arrangements, with the original desks to which the books are still chained, are especially well preserved (see J. W. Clark, The Care of Books, Cambridge, 1902, p. 190). In it are valuable MSS., many of which were used by Aldus Manutius. It also contains a picture gallery with a good “Presentation in the Temple” by Francesco Francia. There are some fine palaces in the town. Three-quarters of a mile south-east on the hill stands the handsome church of S. Maria del Monte, after the style of Bramante, with carved stalls of the 16th century. Wine, hemp and silk are the main articles of trade. About the ancient Caesena little is said in classical authors: it is mentioned as a station on the Via Aemilia, and as a fort in the wars of Theodoric and Narses. During the middle ages it was at first independent. In 1357 it was unsuccessfully defended by the wife of Francesco Orsini, lord of Forlì, against the papal troops under Albornoz. In 1377 it was sacked by Cardinal Robert of Geneva (afterwards Clement VII., antipope). It was then held by the Malatesta of Rimini until 1465, when it came under the dominion of the church. Both Pius VI. (1717) and Pius VII. (1742) were born at Cesena.

Cesenola, Luigi Palma di (1832-1904), Italian-American soldier and archaeologist, was born near Turin on the 29th of July 1832. Having served in the Austrian and Crimean Wars, in 1860 he went to New York, where he taught Italian and French and founded a military school for officers. He took part in the American Civil War as colonel of a cavalry regiment, and at Aldie (June 8th, 1863) wounded and taken prisoner. He was released from Libby prison early in 1864, served in the Wilderness and Petersburg campaigns (1864-65) as a brigadier of cavalry, and at the close of the war was brevetted brigadier-general. He was appointed United States consul at Larnaca in Cyprus (1865-1872). During his stay on the island he carried on excavations, which resulted in the discovery of a large number of antiquities. The collection was purchased by the Metropolitan Museum of New York, and Cesenola became director in 1879. Doubt having been thrown by Gaston L. Feuerant, in an article in the New York Herald (August 1880), upon the genuineness of his restorations, the matter was referred to a special committee, which pronounced in his favour. He is the author of Cyprus, its ancient Cities, Tombs and Temples (1877), an interesting book of travel and of considerable service to the practical antiquary; and of a Descriptive Atlas of the Cesnola Collection of Cypriote Antiquities (3 vols., 1884-86). He died in New York on the 21st of November 1904. He was a

1 For the Cesnola controversy see C. D. Cobham’s Attempt at a Bibliography of Cyprus (4th ed., 1900). See also article CYPRUS.
member of several learned societies in Europe and America, and in 1867 he received a Congressional medal of honour for conspicuous military services.

His brother, Alessandro Palma de Cesnola, born in 1830, conducted excavations at Paphos (where he was U.S. vice-consul) and Salamis on behalf of the British government. The results of these are described in Salaminia (1882).

Cespedes in his youth was a student in theology and oriental languages. On leaving the university, he went to Rome, where he became the pupil and friend of Federigo Zuccaro, under whose direction he studied particularly the works of Raphael and of Michelangelo. In 1560, while yet in Rome, proceedings were taken against him by the Inquisition at Valladolid on account of a letter which, found among the papers of the archbishop of Toledo, had been written by Cespedes during the preceding year, and in which he had spoken with great freedom against the holy office and the inquisitor-general, Fernando de Valdés. Cespedes remained in Rome at this critical moment, and he appears rightly to have treated the prosecution with derision. It is not known how he contrived to bring the proceedings to an end; he retired, however, with his book, as little before 1577, and was installed in a prebend of the cathedral at Cordova, where he resided till his death. Pablo de Cespedes has been called the most servent of Spanish artists. According to his friend Francisco Pacheco, to whom posterity is indebted for the preservation of all of Cespedes’s verse that is extant, the school of Seville owes to him its introduction to the practice of chiaroscuro. He was a bold and correct draughtsman, a skilful anatomist, a master of colour and composition; and the influence he exerted to the advantage of early Spanish art was considerable. Cristobal de Vera, Juan de Peñafiel, and Zambrano were among his pupils. His best picture is a Last Supper at Cordova, but there are good examples of his work at Seville and Madrid. Cespedes was author of several opuscula in prose on subjects connected with his profession. Of his poem On The Art of Painting enough was preserved by Pacheco to enable us to form an opinion of the whole. It is esteemed the best didactic verse in Spanish; and it has been compared, not disadvantageously, with the Georgics. It is written in strong and sonorous octaves, in the majestic declamatory vein of Fernando Herrera, and is not altogether so lifeless as the verses of the lifeless Zuccaro, with its mingling eulogy of Michelangelo, and some excellent advice to young painters, insisting particularly on hard work and on the study of nature. The few fragments yet remaining, amounting in all to some six hundred lines, were first printed by Pacheco in his treatise Del arte de la pintura, in 1649.

Cespedes y Meneses, Gonzalo de (1585–1638), Spanish novelist, was born at Madrid about 1585. Nothing positive is known of him before the publication of his celebrated romance, the Poema trágico del Española Gerardo, y desengaño del amor lascivo (1615–1617); there is evidence that he had been sentenced to eight years at the galleys previous to the 1st of January 1620, and that the penalty had been remitted; but the nature of his offence is not stated. His treatment of political questions in the Historia apologética en los sucesos del rey nos de Aragón, y su ciudad de Zaragoza, años de 97 y 98 (1622), having led to the confiscation of the book, Cespedes took up his residence at Saragossa and Lisbon. While in exile he issued a collection of short stories entitled Historias peregrinas y exemplares (1623), the unfinished romance Varia fortuna del soldado Pindaro (1626), and the first part of his Historia de Felipe IV. (1631), a fulsome eulogy which was rewarded by the author's appointment as official historiographer to the Spanish king. Cespedes died on the 27th of January 1638. His novels, though written in a ponderous, affected style, display considerable imagination and insight into character. The Poema trágico has been utilized by Fletcher in his Spanish Curate and in The Maid of the Mill. The Historias peregrinas has been reprinted (1906) with a valuable introduction by Sr. Cortereal y Morí.

Cess (a shortened form of "asses"); the spelling is due to a mistaken connexion with "census"); a tax; a term formerly more particularly applied to local taxation, in which sense it is still used in Ireland: otherwise it has been superseded by "rate." In India it is applied, with the qualifying word prefixed, to any taxation, such as "irrigation-cess" and the like, and in Scotland to the land-tax.

Cessio bonorum (Latin for a "surrender of goods"), in Roman law, a voluntary surrender of goods by a debtor to his creditors. It did not amount to a discharge unless the property ceded was sufficient for the purpose, but it secured the debtor from personal arrest. The creditors sold the goods in satisfaction, pro tanto, of their claims. The procedure of cessio bonorum avoided infamy, and the debtor, though his after-acquired property might be proceeded against, could not be deprived of the bare necessities of life. The main features of the Roman law of cessio bonorum were adopted in Scots law, and also in the French legal system. (See further Bankruptcy.)

Cesti, Marc Antonio (1620–1669), Italian musical composer, was born at Florence about 1620. He was a pupil of Carissimi, and after holding a post somewhere in Florence as maestro di cappella entered the papal chapel in 1660. In 1666 he became Vice-Kapellmeister at Vienna, and died at Venice in 1669. Cesti was a prolific composer of operas, the most celebrated of which were La Dori (1650) and Il Pompeo d'oro (Vienna, 1668). He was also a composer of chamber cantatas, and his operas are notable for the pure and delicate style of their airs, more suited to the chamber than to the stage.

Cestius, Lucius, surnamed Pius, Latin rhetorician, flourished during the reign of Augustus. He was a native of Smyrna, a Greek by birth. According to Jerome, he was teaching Latin at Rome in the year 13 B.C. He must have been living after A.D. 9, since we are told that he taunted the son of Quintilius Varus with his father's defeat in the Teutoburghian war (Seneca, Controv. i. 3, 10). Cestius was a man of great ability, but vain, quarrelsome and sarcastic. Before he left Asia, he was invited to dinner by Cicero's son, then governor of the province. His host, being uncertain as to his identity, asked a slave who Cestius was; and on receiving the answer, "he is the man who said your father was hilliterate," ordered him to be flogged (Seneca, Ssaorioria, vii. 13). As an orator in the schools Cestius enjoyed a great reputation, and was worshipped by his youthful pupils, one of whom imitated him so closely that the other, also a master of declamation, called "my monkey" Il Pomeo. See his treatise on the art of teaching (Seneca, Controv. ix. 3, 12). As a public orator, on the other hand, he was a failure. Although a Greek, he always used Latin in his declamations, and, although he sometimes was at a loss for Latin words, he never suffered from lack of ideas. Numerous specimens of his declamations will be found in the works of Seneca the rhetorician.

Cestius, Lucius, an Anglo-French word, meaning "that person," which appears in the legal phrases cestui quod trust, use, or vie. It is usually pronounced as "cetti." Cestui quod trust means literally "the person for whose benefit the trust" is created. The cestui quod trust is the person entitled to the equitable, as opposed to the legal, estate. Thus, if land be granted unto, and to the use of A. in trust for B., B. is cestui quod trust, and A. trustee. The term, principally owing to its cumbersome-ness, is being gradually superseded in modern law by that of "beneficiary." Cestui que use (sometimes cestui que trust) means "the person for whose benefit a use" is created (see TRUST). Cestui que vie is "the person for whose life" lands are held by another (see REMAINDER).

Cetacea (from the Gr. κέρως, a whale), the name of the mammalian order represented by whales, dolphins, porpoises, &c. From their fish-like form, which is manifestly merely an adaptation to their purely aquatic life, these creatures are often regarded...
as fishes, although they are true mammals, with warm blood, and suckle their young.

The general form is essentially fish-like, the spindle-shaped body passing anteriorly into the head without any distinct neck, and posteriorly tapering gradually towards the extremity of the tail, which is provided with a pair of lateral, pointed expansions of skin supported by fibrous tissue, called "flukes," forming a horizontal triangular propelling organ, notched behind in the middle line. The head is generally large, in some species attaining more than one-third the entire length, and the mouth is wide, and bounded by stiff, immobile lips. The fore-limbs are reduced to flattened paddles, encased in a continuous skin, showing no external sign of division, and without trace of nails. There are no signs of hind-limbs visible externally. The surface of the skin is smooth and glistening, and devoid of hair, although in many species there are a few bristles in the neighbourhood of the mouth which may persist through life or be present only in the young state. Immediately beneath the skin is a thick layer of fat, held together by a mesh of tissue, constituting the "blubber," which retains the heat of the body. In nearly all species a compressed dorsal fin is present. The eye is small, and not provided with a true lacrymal apparatus. The external ear is a minute aperture in the skin situated at a short distance behind the eye. The nostrils open separately or by a single crescentic aperture, near the vertex of the head.

The bones generally are spongy in texture, cavities being filled with oil. In the vertebral column, the cervical region is short and the vertebrae, always seven in number, are in many species more or less fused together into a solid mass. The odontoid process of the second cervical vertebra, when that bone is free, is usually very obsolete, or even obsolete. In a paper on the form and function of the cervical vertebrae published in "Jenaische Zeitschrift für die Naturwissenschaften," 1905, Dr O. Reiche points out that the shortening and thinning is most pronounced in species which, like the right-whales, live entirely on minute organisms, to capture which they must lower their heads to the surface of the water. At a certain distance from the neck, we find that in these whales the whole seven cervical vertebrae are fused into an immovable solid mass, of which the compound elements, with the exception of the first and second, are but little thicker than plates. On the other hand, in the narwhal, which has but several of which live exclusively on fish, and thus require a certain amount of mobility in the head and neck, we find all the cervical vertebrae much thicker and entirely separate from one another. Among the dolphin group the narwhal and the white whale, or beluga, are distinguished from all other cetaceans by the great comparative length of their cervical vertebrae, all of which are completely free. In the case of the narwhal such an abnormal structure is easily accounted for by the fact that they are the largest of all whales, with which the male is armed a considerable amount of mobility in the neck is absolutely essential. The beluga, too, which is believed to feed on large and active fishes, would likewise seem to require mobility in the cervical region, in order to effect their capture. On the other hand, the porpoise preys on herrings, pilchards and mackerel, which in their densely packed shoals must apparently fall an easy prey with but little exertion on the part of their captor, and we accordingly find all the neck-vertebrae very short, and at least six out of the seven coalesced into a solid immovable mass. None of the vertebrae are united to form a sacrum. The lumbar and caudal vertebrae are numerous and large, and, as their arches are not connected by cartilaginous processes (zygapophyses), they are capable of free motion in all directions. The caps, or epiphyses, at the end of the vertebral bodies are flattened disks, moving only after the animal has attained its full dimensions. The dislocation which may be produced at the beginning of the tail, the presence of which indicates the distinction between caudal and lumbar vertebrae.

In the case of the narwhale the case is short, broad and high, almost spherical, in fact (fig. 1). The supra-occipital bone rises upwards and forwards from the foramen magnum, to meet the frontals at the top, completely excluding the parietals from the upper region; and the latter are displaced laterally to the sides of the skull. The nasals open upwards, and has in front of it a long or horizontally prolonged beak, formed of the maxillae, premaxillae, vomer, and mesethmoid cartilages, extending forwards to form the upper lip of the mouth. There are no clavicles. The humerus is freely movable on the acromion process, and, beyond this the articulations of the limb are imperfect; the flattened ends of the bones coming in contact, allowing independent motion in various planes. The radius and ulna are distinct, and about equally developed, and much flattened, as are all the bones of the flippers. There are four, or more commonly five, digits, and the number of the phalanges of the second and third exceeds the normal number in mammals, sometimes considerably; they present the exceptional character of having epiphyses at both ends. The pelvic girdle is derived by a pair of small rod-like bones placed longitudinally, suspended below and at some distance from the vertebral column at the commencement of the tail. In some species, to the outer surface of these are fixed other small bones or cartilages, the rudiments of the hind-limb.

Teeth are generally present, but exceedingly variable in number. In existing species, they are of simple, uniform character, with conical or compressed crowns and single roots, and are never preceded by milk-teeth. In the whalebone whales teeth are absent (except in the foetal condition), and the palate is provided with numerous, transversely placed horny plates, forming the "whalebone." The alimentary system is complicated by net-like expansions of both arteries and veins, or retia mirabilia. The larvæ are of peculiar shape, the arytenoid cartilages and the epiglottis being elongated, and forming a tubular prolongation, which projects into the posterior nares, and when embraced by the soft palate forms a continuous passage between the nostrils and the trachea, or wind-pipe, in a more perfect manner. The brain is relatively large, round in form, with its surface divided into numerous and complex convolutions. The kidneys are deeply lobulated; the testes are abdominal; and there are no vesiculae seminales nor an os penis. The uterus is bicornate; the placenta non-deciduate and diffuse. The two teats are placed in depressions on each side of the genital aperture. The ducts of the milk-glands are dilated during suckling into large reservoirs, from which the milk is secreted, and from which it is injected by the action of a muscle into the mouth of the young animal, so that sucking under water is greatly facilitated.

Whales and porpoises are found in all seas, and some dolphins and porpoises are inhabitants of the larger rivers of South America and Asia. Their organization necessitates their passing their life entirely in the water, as on land they are absolutely helpless. They have, however, to rise very frequently to the surface for the purpose of respiration; and, in relation to the upward and downward motion in the water thus necessitated, the principal instrument of motion, the tail, is expanded horizontally. The position of the nostril on the highest part of the head is important for this mode of life, as it is the only part of the body the exposure
of which the surface is absolutely necessary. Of numerous erroneous ideas connected with natural history, few are so widespread as that whales spout through their blow-holes water taken in at the mouth. But the spouting, or "blowing", of whales is nothing more than the ordinary act of expiration, which, taking place at longer intervals than land-animals, is performed with a greater emphasis. The moment the animal rises to the surface it forcibly expels from its lungs the air taken in at the last inspiration, which is charged with vapour in consequence of the respiratory changes. This rapidly condensing in the cold atmosphere in which the phenomenon is often observed, forms a column of steam or spray, which has been taken for water. It happens, however, especially when the surface of the ocean is agitated into waves, that the animal commences its expiratory puff before the orifice has cleared the top of the water, some of which may thus be driven upwards with the blast, tending to complete the illusion. From photographs of spouting rorquals, it appears that the height and volume of the "spout" of all the species is much less than was supposed to be the case by the older observers; even that of the huge "sulphur-bottom" (Balaenoptera sibbaldii) averaging only about 14 ft. in height, although it may occasionally reach 20 ft.

As regards their hearing, the capacity of cetaceans for receiving (and acting upon) sound-waves is demonstrated by the practice of shouting on the part of the fishermen when engaged in driving a shoal of porpoises or black-fishes into shallower water, for the purpose of capturing them as victims. As the possession of a voice by cetaceans, it is stated that one species, the "buckelwal" of the Germans, utters during the breeding season a prolonged scream, comparable to the scream of a steam-siren, and embracing the whole musical scale, from base to treble. In respect of anatomical considerations, it is true that the external ear is much reduced, the "pinna" being absent, and the tube or "meatus" of very small calibre. On the other hand, the internal auditory organs are developed on the plan of those of ordinary mammals, but display certain peculiar modifications (notably the remarkable shell-like form of the tympanic bone) for intensifying and strengthening the sound-waves as they are received from the water. It seems, therefore, perfectly evident that whales must hear when in the water. This inference is confirmed by the comparatively small development of the other sense-organs. The eye, for instance, is very small, and can be of little use even at the comparatively small depths to which whales are now believed to descend. Again, the sense of smell, judging from the rudimentary condition of the olfactory organs, must be in abeyance; and whales have no sense-organs comparable to the lateral-line-system of fishes. Consequently, it would seem that when below the surface of the water they must depend chiefly upon the sense of hearing. Probably this sense is so highly developed as to enable the animals, in the midst of the vibrations made by the screw-like movements of the tail, or flukes, to distinguish the sound (or the vibrations) made by the impact of water against rocks, even in a dead calm, and, in the case of piscivorous species, to recognize by the pulse in the water the presence of a shoal of fish. Failing this explanation, it is difficult to imagine how whales can find their way about in the semi-darkness, and avoid collisions with rocks and rock-bound coasts.

In the Christiania Nyt Magasin for Naturvidenskaberne, vol. xxxviii., Dr G. Gulberg has published some observations on the body-temperature of the Cetacea, in which he shows how extremely important is the knowledge of this subject. As he remarks, it is a matter of extreme difficulty to obtain the temperature of living cetaceans, although this has been taken in the case of a white-whale and a dolphin, which some years ago were kept in confinement in a pond at the United States Naval Observatories. But while the former whales such a method of procedure is, however, obviously quite impracticable, and we have, accordingly, to rely on post-mortem observations. The layer of blubber by which all cetaceans are protected from cold renders the post-mortem examination of the bodies of these animals quite impracticable. The blood-temperature of a specimen of Sibbald's rorqual three days after death still stood at 34°C. The various observations that have been taken have afforded the following results in individual cases: Sperm-whale, 40°C; Greenland right-whale, 38-8°C; porpoise, 35-6°C; liver of a second individual, 37-8°C; common rorqual, 35-4°C; dolphin, 35-6°C. The average blood-temperature of man is 37°C, and that of other mammals 39°C; while that of birds is 42°C. The record of 40°C in the case of the sperm-whale seems to indicate that at least some cetaceans have a relatively high temperature.

With the possible exception of one West African dolphin, all the Cetacea are predaceous, subsisting on living animal food of some kind. One kind alone (Orca) eats other warm-blooded animals, as seals, and even members of its own order, both large and small. Many feed on fish, others on small floating crustaceans, pteropods and jelly-fishes, while the principal staple of the food of many is constituted by cuttle-fishes and squids. In size cetaceans vary much, some of the smaller dolphins scarcely exceeding 4 ft. in length, while whales are the most colossal of all animals. It is true that many statements of their bulk are exaggerated, but the actual dimensions of the larger species exceed those of all other animals, not even excluding the extinct dinosaurian reptiles. With some exceptions, cetaceans are generally timid, inoffensive animals, active in their movements and affectionate in their disposition towards one another, especially the mother towards the young, of which there is usually but one, or at most two at a time. They are generally gregarious, swimming in "schools," sometimes amounting to many thousands in number; though some species are met with either singly or in pairs.

Commercially these animals are of importance on account of the oil yielded by the blubber of all of them; while whalebone, spermaceti and ambergris are still more valuable products yielded by certain species. Within the last few years whalebone has been sold in America for £290 per ton, while it is also asserted that £300 per ton has been paid for two and a quarter tons at Aberdeen, although there seems to be some degree of doubt attaching to the statement. Soon after the middle of the last century, the price of this commodity was as low as £150 per ton, but, according to Mr Frank Buckland, it suddenly leapt up to £200 with the introduction of "crinoline" into ladies' costume, and it has apparently been on the rise ever since. Ambergris, which is very largely used in perfumery, is solely a product of the sperm-whale, and appears to be a kind of biliary calculus. It generally contains a number of the horny beaks of the cuttle-fishes and squids upon which these whales chiefly feed. Its market-price is subject to considerable variation, but from £3 to £4 per oz. is the usual average for samples of good quality. In 1839 a merchant in Mincing Lane was the owner of a lump of ambergris weighing 92 lb, which was sold in Paris for about £5-5 per oz., or £15-350.

Whalebone Whales.—Existing Cetacea are divisible into two sections, or suborders, the relationships of which are by no means clearly apparent. The first section is that of the whalebone whales, or Mystacoceti, in which no functional teeth are developed, although there are tooth-germs during foetal life. The palate is furnished with plates of baleen or whalebone; the skull is symmetrical; and the nasal bones form a roof to the nasal passages, which are directed upwards and forwards. The maxilla is produced in front, and forms the baleen plates, or "bristles." The tympanic is small and distinct from the jugal. The tarsus is doubled, and forms a falteric, which is attached to the base of the skull by two strong diverging processes. The olfactory organ is distinctly developed. The two halves of the lower jaw are arched outwards, their anterior ends meeting at an angle of about sixty degrees, but with no symphys. All the ribs at their upper extremity articulate only with the transverse processes of the vertebrae; their capitular processes when present not articulating directly with the bodies of the vertebrae, the articular surface of each being flattened and provided with articulations only with a single pair of ribs; and there are no ossified sternal ribs. External openings of nostrils distinct from each other, longitudinal. A short conical caecum.

Whalebones. A few species of whales have numerous minute tooth-like teeth lying in the dental groove of both upper and lower jaws. They are best developed about the middle of foetal life, after which they are absorbed, and no trace of them remains at the time of birth. The whalebone does not make its appearance until after birth; and consists of a series of flattened horny plates, between three and four hundred in number, on each side of the palate, with a bare interval along the middle line. The plates are placed transversely to the long axis of the palate, with short intervals between them. Each plate or blade is somewhat triangular in form, with the base
attached to the palate and the apex hanging downwards. The outer edge of the blade is hard and smooth, but the inner edge and apex fray out into long bristle fibres, so that the roof of the whale's mouth looks as if covered with hair, as described by Aristotle. At the inner edge of each principal blade are two or three much smaller, and often the nearest to the middle of the series, and gradually diminish towards the front and back of the mouth. And gradually diminish towards the front and back of the mouth. The plates grow from a fibrous and vascular matrix, which covers the palatal surface of the maxillae, and forms the principal base of each blade. Moreover, the free edges of these processes are covered with long vascular thread-like papillae, one of which forms the central axis of each of the hair-like fibres mainly composing the blade of the whalebone. The blades are made up of numbers of these soft vascular papillae, circular in outline, and surrounded by concentrically arranged epidermic cells, the whole bound together by other epidermic cells, that constitute the so-called "exoskeleton", or bony surface of the blade. Disintegrating at the free edge, it allows the individual fibres to become loose and assume a hair-like appearance.

Whalebone really consists of modified papillae of the mucous membrane of the mouth, with an accessory and horny epithelial development. The blades are supported and bound together for a certain distance from their base, by a mass of less hardened epithelium, secreted by the surface of the palatal membrane of the oral cavity, and by a number of different processes. These are the "gills" of the whalebone. Whalebone varies much in colour and structure in different species; some are black, others slaty, or yellow, or even creamy-white. In some cases the blades are various shades of brown, or striped with different hues. They differ greatly in other respects, being short, thick, coarse, and stiff in some cases, and greatly elongated and highly elastic in others. In those species in which it has attained its fullest development, the function of whales is to increase the volume of the small mammalian capsules, crushed by the various forms of fish that are on which the whalebone subsists. In feeding, whales fill the immense mouth with water containing shoals of these small creatures, and then, on closing the lips and raising the tongue, bring the water in through the narrow intervals between the hairy fringes of the whalebone, and escape through the lips, leaving the prey to be swallowed.

Although sometimes divided into two families, Balanidae and Balantidae, whalebone-whales are best included in a single family group under the former name. The typical members of this family are the so-called right-whales, forming the genus Balana, in which there are two species, the black whale (Balaena mysticetus) of the Arctic seas, the whalebone and oil of which are of so much value, and the grey whale or baleen whale (Balaena erus), of which there are several races, distinguished from each other by their having either somewhat more or less than the usual number of vertebrae. In the warm temperate waters of both northern and southern hemispheres, and have been divided into species in accordance with their geographical distribution, such as B. balaenoptera, the great right whale, B. acutirostris of the South Atlantic, and B. antarcticus and Nova Zelandiae of the South Pacific; but the differences between them are so small that they may probably, if not regarded as a single species, the black whale (B. australis). On the head these whales carry a peculiar structure which is known to whales as the "ballet." This is a long horned excrescence, worn into hollows like a many-ribbed piece of limestone rock, growing probably in the neighborhood of the blow-hole. More is suggested to account for its presence. One suggestion is that it indicates the descent of whales from rhinoceros-like mammals; another that this species of whale is in the habit of rubbing against rocks in order to get rid of the hard and boundless corn—although why on the nose alone is not stated. Dr. W. G. Ridewood, however, considers that the relationship with the horns which are not in the possession of most whales and are not suggested to account for its presence. The best known of these (Hedbalaena marginata) represents a genus agreeing with the right-whales in the absence of tooth-fluting, and with the rostrals in the presence of a dorsal fin. The cervical vertebrae are united, and there are no parietals, veritcally all along the dorsal fin. The tail is usually long, narrow, and with only four digits. The ribs are remarkably expanded and flattened; the scapula long and broad, with completely developed acromion and coracoid processes. The whalebone is long, slender, elongate, and narrow, and with smooth fibrous and acromion fibers. The Australian and New Zealand seas is the smallest of the whalebone-whales, being not more than 20 ft. in length.

In contrast, the necking is the great grey whale (Pachydermatinae: placus) of the North Pacific, which combines the relatively small head, elongated shape, and narrow flippers of the fin-whales, with the smooth throat and absence of a back-fin distinctive of the right-whales. The whalebone is shorter and coarser than in any other species. In the skeleton the cervical vertebrae are free, and the first two ribs on each side expanded and united to form a large bony shield. In the humpback-whale (Megaptera longipenna or balaenoptera), the name of the whalebone is also represented by two or three long, slender, and narrow, and with the cervical vertebrae free. The skin of the throat is fluted so as to form an expansile pouch; there is a long back-fins; and the flippers, which have four digits each, are extremely long, equaling about the length of the body. The thoracic and coracoid processes of the scapula are rudimentary.

See HUMPBACK-WHALE.

The right-whales are built for cruising slowly about in search of the shoals of small fish, which are often thrown up in the form of a broad beam, with a float-shaped body and immovable neck. The humpback is of somewhat similar build, but with a smaller head, and probably attains considerable speed owing to the length of its flippers (that it is "balaenoptera"). The right-whales are built entirely for speed, and are the ocean greyhounds of the ground. Their bodies are consequently long and attenuated, and their heads are partially mobile; while they are furnished with capable and forceful flippers. They may be recognized by the hump from the smaller head, long and slender build, small, narrow, and pointed flippers, each containing four digits, and the large acromion and coracoid processes to the low and broad scapula. Resemblances found in almost every sea. Among them are the most gigantic of all animals, B. sibbaldi, which attains the length of 80 ft., and the small B. rostrata, which does not exceed 30 ft. There are certainly four distinct modifications of this genus, represented by the two juvenile species and the two adult species of B. balaenoptera, and the question whether these identical forms found in the Indian, Southern and Pacific Oceana are to be regarded as specifically identical, or as distinct exist. Although these have already reached the following distinct names as follows:

In the report on the zoology of the "Discovery" expedition, published in 1897 by the British Museum, E. A. Wilson describes a whale frequenting the frigate-birds, and which is a baleen whale and has more than five digits on the head, with the gills indicating the right-whale. It is white, and the flippers are mostly covered with the dorsal fin, and the tail fluke with the usual fin-like structure of the skull by longitudinal rows. They are the same size as the regular right-whales, and in the South in the Indian and Pacific Oceana are called the "balaenoptera." They are usually found in the South seas, and in the North they have the usual rounded plait of the right-whale.

Toothed Whales.—The second suborder is represented by the bowhead whales, or Odontoceti, in which there is the whalebone, and in which its numerous, though sometimes reduced to the number of five, occasionally wanting, are normally developed. Unlike that of the whalebone-whales, the upper jaw is more or less than the usual number of vertebrae. There are also no nodules or flattened plates, applied closely to the frontals, and not forming any part of the roof of the nasal passage, which is directed upwards and backwards. The olfactory organs are on the roof of the nasal passage, and covering the greater part of the palate of the lateral nasal bones. Loricaria bone is also separable from the jugal, and, if distinct, large, and forming part of the roof of the orbit. Tympanic bone not usually a part of the skull by ligament, but sometimes are formed into the squamous part of the skull. Two halves of the jaw nearly straight, expanded in height, posteriorly, with a wide funnel-shaped aperture to the dental canal, and coming in contact in front by a flat surface of bone. No incisors or incisor-like teeth. Interior and posterior ribs with well-developed tip-like processes, which articulate with the body of the vertebrae. Sternum almost always composed of several pieces, placed one behind the other, with several small ribs, and ossified or covering the greater part of the spinal column by ligament. External respiratory aperture single, the two nostrils uniting before they reach the nasal passage, usually in the form of a transverse sub-crenate valvar aperture, situated on the top of the head, with five digits, though the first and fifth are usually little developed. No caecum, except in the Platanista.

The first family, Physeteridae, is typified by the sperm-whale, and characterized by the absence of functional teeth, with long, slender, and broad; and with the body of the vertebral column reduced in number. Bones of the skull raised so as to form an elevated prominence and the cerebellum. Pterygoid bones thick, produced backwards, meeting in the middle line, and not involving the palatal wall of the skull, which is completely hollowed on their outside side. Transverse processes of the arches of the dorsal vertebrae, to which the tubercles of the ribs are attached, ceasing abruptly near the end of the series, and replaced by processes on the body at a lower level. The right and left hook of the jaw, the right and left posterior ribs, and the vertebrae of the lumbar vertebrae. Costal cartilages not ossified.

The first group, Physeteridea, includes the sperm-whale itself, and is characterized by the presence of lower teeth, which are in the form of a groove in places of sockets, the groove being incompletely divided by the septa, and the teeth held in place by the strong, fibrous gum. No distinct lamina bone. Skull strikingly asymmetrical in the sides of the head, consequence of the left opening greatly exceeding the right in size. In the sperm-whale (Physeter macrocephalus) the upper teeth are apparently of uncertain number, rudimentary and functionless, being embedded in the gum. Lower jaw with from 20 to 25 teeth on each side, stout, conical, recurved and pointed at the apex.
CETACEA

until they are worn, without enamel. Upper surface of the skull concave; its posterior and lateral edges raised into a very high and greatly compressed semicircular crest or wall (fig. 2). Zygomatic processes of jugal bones thick and massive. Muzzle elongated, broad at the base, and gradually tapering to the apex. Lower jaw exceedingly long and narrow, the symphysis being more than half the length. Vertebrae: C 7, D 11, L 8, Ca 24; total 50. Atlas, or first vertebra, free; all the other cervical vertebrae united by their bodies and spines into a single mass. Eleventh pair of ribs rudimentary. Head about one-third the length of the body; massive, high, and truncated, and rather compressed in front; owing its huge size and form mainly to the accumulation of a mass of fatty tissue filling the large hollow on the upper surface of the skull and forming the depression of the nose. The single blow-hole is longitudinal, slightly S-shaped, and placed at the upper and anterior extremity of the head to the left side of the middle line. The opening of the mouth is on the under side of the head, considerably behind the end of the snout. Flippers short, broad and truncated. Dorsal fin represented by a low protuberance. See Sperm-Whale.

In the lesser of the pinniped sperm whale (Cetorhinus brevirostris) there may be a pair of rudimentary teeth in the upper jaw, while on each side of the lower jaw there are from 9 to 12 rather long, slender, pointed and curved teeth, with a coating of enamel. Upper surface of the skull concave, with thick, raised, posterior and lateral margins, massive and rounded at their anterior terminations above the orbits. Muzzle not longer than the cranial position of the skull, broad at the base, and rapidly tapering to the apex. Zygomatic process of the jugal rod-like. Lower jaw with synphyses less than half its length. Vertebrae: C 7, D 13 or 14, L and Ca 30; total 50 or 51. All the cervical vertebrae united by their bodies and arches. The head is about one-sixth of the length of the body, and obtusely pointed in front; the mouth small and placed far below the apex of the snout; the blow-hole crescentic, and placed obliquely on the crown of the head in advance of the eyes and to the left of the middle line; while the flippers are bluntly sickle-shaped, and the back-fin triangular. This species attains a total length from 9 to 13 ft.

A second subfamily is represented by the bottle-noses and beaked whales, and known as the Ziphiidae. In this group the lower teeth are rudimentary and concealed in the gum, except one, or rarely two, which may be largely developed, especially in the male. There is a distinct lacrymal bone. Externally the mouth is produced into a slender rostrum or beak, from above which the rounded eminence formed by a cushion of fat resting on the cranium in front of the blow-hole rises somewhat abruptly. The blow-hole is single, crescentic and median, as in the Delphinidae. Flippers small, ovate, with five digits moderately well developed. A small obtuse dorsal fin situated considerably behind the middle of the back. Longitudinal grooves on each side of the skin of the throat, diverging posteriorly, and nearly meeting in front. In external characters and habits the whales of this group closely resemble each other. They appear to be almost exclusively feeders on cuttle-fishes, and occur either singly, in pairs, or in small herds. By their dental and osteological characters they are easily separated into four genera.

In the first of these, Hyperodo, or bottle-nose, there is a small conical pointed tooth at the apex of each half of the lower jaw, concealed by the gum during life. Skull with the upper ends of the premaxillae rising suddenly behind the nostrils to the vertex and expanded laterally, their outer edges curving backwards and their superior surfaces arching forwards and overlapping the nostrils; the right larger than the left. Nasal bones lying in the hollow between the upper extremities of the premaxillae, strongly concave in the middle line and in front; their outer edges, especially that of the right, expanded over the front of the inner border of the maxilla. Very high longitudinal crests on the maxillae at the base of the blow, extending backwards almost to the nostrils, approaching each other in the middle line above; sometimes compressed and sometimes massive that their inner edges come almost in contact. Preorbital notch distinct, and mesethmoid cartilage slightly ossified. Vertebrae: C 7, D 9, L 10, Ca 19; total 45. All the cervical vertebrae united. Upper surface of the head in front of the blowhole very prominent and rounded, rising abruptly from above the small, distinct snout. Two species are known. See Bottle-nose Whale.

The typical representative of the beaked whales is Ziphus capensis, in which there is a single conical tooth of moderate size on each side close to the anterior extremity of the lower jaw, directed forwards and upwards. Skull with the premaxillae immediately in front and at the sides of the nostrils expanded, hollowed, with elevated lateral margins, the posterior end due to the vertex and curving forwards, the right being considerably more developed than the left. The conjoint naeals form a pronounced symmetrical eminence at the top of the skull, projecting forwards over the nostrils, flat above, prominent and rounded in the middle line in front, and separated by a notch on each side from the maxillæ. Preorbital notch not distinct. Rostrum (seen from above) triangular, tapering from the base to the apex; upper and outer edges of maxillæ at base of rostrum raised into low roughened tuberosities. Mesethmoid cartilage densely ossified in adult age, and concurring with the surrounding bones of the rostrum. Vertebrae: C 7, D 10, L 10, Ca 22; total 49. The three anterior cervical vertebrae united, the rest free.

In the numerous species of the allied genus Mesoplodon there is a much-compressed and pointed tooth in each half of the lower jaw, variably situated, but generally at some distance behind the apex; its point directed upwards, and often somewhat backwards, occasionally developed to a great size. In the skull the region round the nostrils is as in Hyperodo, except that the nasal is much narrower and more sunk between the upper ends of the premaxillae; like those of Hyperodo, they are concave in the middle line in front and above. No maxillary tuberosities. Preorbital notch not very distinct. Rostrum long and narrow. Mesethmoid in the adult ossified in its entire length, and concurring with the surrounding bones. Vertebrae: C 7, D 10, L 10 or 11, Ca 19 or 20; total 46 to 48. Two or three anterior cervical united, the rest usually free.

Though varying in form, the lower teeth of the different members of this genus agree in their essential structure, having a small and pointed enamel-covered crown, composed of dentine, which, instead of surmounting a root of the ordinary character, is raised upon a solid mass of osteodentine, the continuous growth of which greatly alters the form and general appearance of the teeth as age advances, as in the case of M. layardi, where the long, narrow, flat, strap-like teeth, curving inwards at their extremities meet over the rostrum, and interfere with the movements of the jaw. In one species (M. grayi), a row of minute, conical, pointed teeth, like those of ordinary Dolphins, 17 to 19 in number, is present even in the adult, on each side of the middle part of the upper jaw, but embedded by their roots only in the gum, and not in bony sockets. This, with the frequent presence of rudimentary teeth in other species of this genus, indicates that the beaked whales are derived from ancestral forms with teeth of normal character in both jaws. The species are distributed in both northern and southern hemispheres, but most frequent in the latter. Among them are M. bidens, M. capensis, M. densirostris, M. layardi, M. grayi and M. Hectori, but there is still much to be learned with regard to their characters.
and distribution. This group was abundant in the Pliocene age, as attested by the frequency with which the imperishable long, cylindrical rostrum of the skull, of more than ivory denseness, is found among the rolled and watered animal remains which compose the "bone-bed" at the base of the Red Crag of Suffolk.

Finally, in the Ross Sea, which grows to a length of 30 ft., there are two moderately-sized, compressed, pointed teeth, on each side of the symmetrical of the lower jaw, with their summits directed forwards, the anterior being the larger of the two and close to the front of the jaw. Upper ends of the maxillae near symmetrical, moderately elevated, slightly expanded, and not curved forward over the nostrils. Nasals broad, massive and rounded, of nearly equal size, forming the vertex of the skull, flattened in front, most prominent in the mid line. Preorbital notch distinct. Rostrum long and narrow. Mesethmoid partially ossified. Small rough eminences on the outer edge of the upper surface of the maxillae at base of rostrum. Vertebrae:

**Fig. 6.**—The Susu, or Ganges Dolphin (Platanista gangetica).

C 7, D 10, L 12, Ca 19; total 48. The three anterior cervicals welded, the rest free and well developed. Apparently this whale has the power of raising its teeth up and down, exposing them to view and attacked.

In a family of themselves—the *Platiniidae*—are placed three cetaceans which differ from the members of the preceding and the following groups in the more peculiar articulation of the ribs, as the tubercular and capitular articulations, distinct at the commencement of the series, gradually blend together, as in most mammals. The cervical vertebrae are all free. The lacrimal bone is not distinct from the jugal. The jaws are long and narrow, with numerous teeth in both; the symmetry of the lower one exceeding half its length. Externally the head is divided from the body by a slightly constricted neck. Pectoral limbs broad and truncated. Dorsal fin small or obsolete. In habits these dolphins are fluvial or estuarine. In the Indian susu, or Ganges dolphin (Platanista gangetica), the teeth number about 4 on each side, are set near together, are rather large, cylindrical, and sharp-pointed in the young, but in old animals acquire a large laterally compressed base, which in the posterior part of the series becomes irregularly divided into roots. As the conical enamel-covered crown wears away, the teeth of the young and old animals have a totally different appearance. The beak and tooth-bearing portion of the lower jaw are so narrow that the teeth of the two sides are almost in contact, while on the upper jaw only incised, compressed bony crests, which overarch the nostrils and base of the rostrum, and almost meet in the middle line above. Orbits very small and eyes rudimentary, without crystalline lens. Blow-hole dorsal, parallel line. Lower jaw length 5 1/2, L 8, C 14; total 51. A small caecum. No pelvic bones. Dorsal fin represented by a low ridge.

The second genus is represented by *Inia geoffrenii*, of the Amazon, in which the teeth vary from 26 to 33 pairs in each palate.

**Fig. 7.**—River Plate Dolphin (Stenodelphis blainvillei).

The last family of existing cetaceans is the above-mentioned *Delphinidae*, which includes the true dolphins, porpoises, grampus and their relatives. As a rule there are numerous teeth in both jaws; and the pterygoid bones of the skull are short, thin and involuted to form with a process of the palate bone the outer wall of the post-

**Fig. 8.**—Upper surface of the skull of Narwhal (Monodon monoceros), with the whole of both teeth exposed by removal of the upper wall of its alveolar cavities.
The porpoise, which is so common in British waters and the Atlantic, seldom enters the Mediterranean, and apparently never resides there. There is, however, a porpoise in the Black Sea, which, according to Dr O. Abel, is entitled to rank as a distinct species, with the name Stenella lieberti. The rostrum of this porpoise is pointed and considerably elongated, and the teeth are also different in form and number. The absence of porpoises from the Mediterranean is explained by Dr Abel on account of the greater saltness of that sea as compared with the ocean in general; his idea being that these cetaceans are prevented from entering that sea by water members of the group, and therefore camouflaged from entering the area.

**Fig. 9.—Beluga or White-Whale (Delphinapterus leucas).** From a specimen taken in the river St Lawrence and exhibited in London, 1877. North shore of the Black Sea, the same writer has described an extinct type of ancestral porpoise, under the name of Plateocetacea andrus- sowi. Another species is the wholly black, *P. spinipennis*, typically from South America. Black is also the hue of the Indian porpoise (*N. novaehollandiae*), which wants a dorsal fin, and has eighteen pairs of teeth rather larger than those of the ordinary porpoise. (See PORPOISE.)

Next comes the Indo-Malayan genus *Orcella*, in which the 1/2 to 1/3, small, conical, pointed, rather closely set, and occupying nearly the whole length of the rostrum. Sub-globular, high, Rostrum nearly equal in length to the cranial portion of the skull, tapering. Flippers of moderate size, not elongated, but somewhat broader, than the body of the digits broader than long, except the first phalanges of the index and third fingers. Head globular in front. Dorsal fin rather small, placed behind the middle of the body. Two species, both of small size—*O. brevirostris*, from the Bay of Bengal, and *O. jamiensis*, from the Irawaddy river, from 900 to 900 m. from the sea.

In the grampus, or killer, *Orcra gladiator* or *O. orca* the teeth form about twenty pairs, above and below, occupying nearly the whole length of the rostrum, very large and stout, with conical recurved crowns, united laterally and flattened, or rather hollowed, on the anterior and posterior surfaces. Rostrum about equal in length to the cranial part of the skull, broad and flattened above, rounded in front; premaxillaries broad and rather concave in front of the nostrils, concave at the middle of the rostrum, and expanding again towards the apex. Vertebræ: *C. 7, D. 11* or 12, L 10, Ca 23; total 51 or 52; bodies of the first and second and sometimes the third cervical vertebræ united; the rest free.

**Fig. 10.—The Grampus or Killer (Orcra gladiator).** Flippers very large, ovate, nearly as broad as long, with all the phalanges and metatarsals broader than long. General form of body robust. Face short and rounded. Dorsal fin near the middle of the back, very high and pointed. See GRAMPSUS.

The lesser killer or black killer, *Pseudorca crassidens*, has its teeth confined to the anterior half of the rostrum and corresponding part of the lower jaw; they are small, conical, curved and sharp-pointed when unworn, but sometimes deciduous in old age. Skull broad, with a wide breadth of the digits broader than long, except the first phalanges of the third fingers. Sub-globular, in the head. Rostrum almost equal in length to the cranial portion of the skull, broad and flattened above, rounded in front; premaxillaries broad and rather concave in front of the nostrils, concave at the middle of the rostrum, and expanding again towards the apex. Vertebræ: *C. 7, D. 11* or 12, L 12 or 13, Ca 28 or 29, total 58 or 59. Bodies of the anterior five or six cervical vertebræ united. Length of the bodies of the lumbar and anterior caudal vertebræ equal to about their length. Flippers very long and narrow, with the second digit the longest, and having as many as 12 or 13 phalanges, the third shorter (with 9 phalanges), the fourth, fifth and fourth almost sympatric. Fore part of the head round, in consequence of the great development of a
CETEGUS, the name of a Roman patrician family of the Cornelian gens. Like the younger Cato its members kept up the old Roman fashion of dispensing with the tunic and leaving the arms bare (Horace, Ars Poetica, 50; Lucan, Pharsalia, ii, 543). Two individuals are of some importance:

(1) Marcus Cornelius Cethegus, pontifex maximus and curule aedile, 213 B.C. In 211, as praetor, he had charge of Apulia; later, he was sent to Sicily, where he proved a successful administrator. In 209 he was censor, and in 204 consul. In 203 B.C. he was proconsul in Upper Italy, where, in conjunction with the praetor P. Quintilius Varus, he gained a hard-won victory over Mago, Hannibal’s brother, in Insubrian territory, and obliged him to leave Italy. He died in 106. He had a great reputation as an orator, and is characterized by Ennius as “the quintessence of persuasiveness” (suadis modullo). Horace (Ars Poet., 50; Epistles. ii, 2, 117) calls him an authority on the Latin use of words.

Livy xxv, 2, 41, xxvii, 11, xxxix, 11, xxxv, 18.

(2) Gaius Cornelius Cethegus, the boldest and most dangerous of Catiline’s associates. Like many other youthful proficients, he joined the conspiracy in the hope of getting his debts cancelled. When Catiline left Rome in 63 B.C., after Cicero’s first speech, Cethegus remained behind as leader of the conspirators with P. Lentulus Sura. He himself undertook to murder Cicero and other prominent men, but was hampered by the dilatoriness of Sura, whose age and rank entitled him to the chief consideration. The discovery of arms in Cethegus’s house, and of the letter which he had given to the ambassadors of the Allobroges, who had been invited to cooperate, led to his arrest. He was condemned to death, and executed, with Sura and others, on the night of the 5th of December.

Sallust, Catilina, 46-55; Cicero, In Cat. iii, 57; Appian, Bell. Civ. ii, 52; see CATILINE.

CETINA, Gutierre de (1518?–1572?), Spanish poet and soldier, was born at Seville shortly before 1520. He served under Charles V in Italy and Germany, but retired from the army in 1545 to settle in Seville. Soon afterwards, however, he sailed for Mexico, where he resided for some ten years; he appears to have visited Seville in 1557, and to have returned to Mexico, where he died at some date previous to 1575. A follower of Boscán and García de la Vega, a friend of Jerónimo de Urrea and Baltasar del Alcázar, Cetina adopted the doctrines of the Italian school and, under the name of Vandelio, wrote an extensive series of poems in the newly introduced metres; his sonnets are remarkable for elegance of form and sincerity of sentiment, his other productions being in great part adaptations from Petrarch, Ariosto and Ludovico Dolce. His patrons were Antonio de Leyva, prince of Ascoli, Hurtado de Mendoza, and Alva’s grandson, the duke de Sessa, but he seems to have profited little by their protection. His works have been well edited by Joaquín Hazañas y la Rúa in two volumes published at Seville (1803).

CETTE, a seaport of southern France in the department of Hérault, 18 m. S.W. of Montpellier by the Southern railway. Pop. (1906) 15,650. After Marseilles it is the principal commercial port on the south coast of France. The older part of Cetée occupies the foot and slope of the Mont St Clair (the ancient Mont Setius), a hill 500 ft. in height, situated on a tongue of land that lies between the Mediterranean sea and the lagoon of Thau. This quarter with its wide streets and lofty stone buildings is bounded on the east by the Canal de Cette, which leads from the lagoon of Thau to the Old Basin and the outer harbour. Across the canal lie the newer quarters, which chiefly occupy two islands separated from each other by a wet dock and limited on the east by the Canal Maritime, parallel to the Canal de Cette. A lateral canal units the northern ends of the two main canals. A breakwater running W.S.W. and...
CETTIGNE—

CETUS (“The Whale”), in astronomy, a constellation of the southern hemisphere, mentioned by Eudoxus (4th century B.C.) and Aratus (3rd century B.C.), and fabled by the Greeks to be the monster sent by Neptune to devour Andromeda, but which was slain by Perseus. Ptolemy catalogued 22 stars in this constellation; Tycho Brahe, 21; and Hevelius, 45. The most remarkable star of this constellation is α (Mira) Ceti, a long-period variable, discovered by the German astronomer Fabricius; its magnitude varies between about 3 to 9, and its period is 331 days. ρ-Ceti is an irregular variable, its extreme magnitudes being 5 and 7; γ-Ceti is a beautiful double star, consisting of a yellow star of magnitude 3 and a blue of magnitude 6-8; ω-Ceti is also a double star.

CETYWAYO (1784–1884), king of the Zulus, was the eldest son of King Umbanda or Panda, and a nephew of the previous kings, Dingaan and Chaka. Cetywayo was a young man when in 1840 his father was placed on the throne by the aid of the Natal Boers; and three years later Natal became a British colony. Cetywayo had inherited much of the military talent of his uncle Chaka, the organizer of the Zulu military system, and chafed under his father's peaceful policy towards his British and Boer neighbours. Suspecting Panda of favouring a younger son, Umbulazi, as his successor, Cetywayo made war on his brother, whom he defeated and slew at a great battle on the banks of the Tugela in December 1856. In the following year, at an assembly of the Zulus, it was resolved that Panda should retire from the management of the affairs of the nation, which were entrusted to Cetywayo, though the old chief kept the title of king. Cetywayo was, however, suspicious of the Natal government, which afforded protection to two of his brothers. The feeling of distrust was removed in 1861 by a visit from Mr (afterwards Sir) Theophilus Shepstone, secretary for native affairs in Natal, who induced Panda to proclaim Cetywayo publicly as the future king. Friendly relations were then maintained between the Zulus and Natal for many years. In 1872 Panda died, and Cetywayo was declared king, August 1873, in the presence of Shepstone, to whom he made solemn promises to live at peace with his neighbours and to govern his people more humanely. These promises were not kept. Not only were numbers of his own people wantonly slain (Cetywayo returning defiant messages to the governor of Natal when remonstrated with), and the military system of Chaka and Dingaan strengthened, but he had a feud with the Transvaal Boers as to the possession of the territory between the Buffalo and Pongola rivers, and encouraged the chief Sekukuni (Seecoceni) in his struggle against the Boers. This feud with the Boers was inherited by the British government on the annexation of the Transvaal in 1877. Cetywayo’s attitude became menacing; he allowed a minor chief to make raids into the Transvaal, and seized natives within the Natal border.

Sir Bartle Frere, who became high commissioner of South Africa in March 1877, found evidence which convinced him that the Kaffir revolt of that year on the eastern border of Cape Colony was part of a design or desire for a general and simultaneous rising of Kaffirdom against white interference, and the Kaffirs undoubtedly looked to Cetywayo and the Zulus as the most redoubtable of their champions. In December 1878 Frere sent the Zulu king an ultimatum, which, while awarding him the territory he claimed from the Boers, required him to make reparation for the outrages committed within the British borders, to receive a British resident, to disband his regiments, and to allow his young men to marry without the necessity of having first “washed their spears.” Cetywayo, who had found a defender in Bishop Colenso, vouchsafed no reply, and Lord Chelmsford entered Zululand, at the head of 13,000 troops, on the 11th of January 1879 to enforce the British demands. The disaster of Isandhlwana and the defence of Rorke’s Drift signaled the commencement of the campaign, but on the 4th of July the Zulus were utterly routed at Ulundi. Cetywayo became a fugitive, but was captured on the 28th of August. His kingdom was divided among thirteen chiefs and he himself taken to Cape Town, whence he was brought to London in

E.N.E. protects the entrance to the harbour, which is one of the safest in France. The outer port and the Old Basin are enclosed by a mole to the south and by a jetty to the east. Behind the outer port lies an inner and more recent basin which communicates with the Canal Maritime. The entire area of the harbour, including the canals, is 111 acres with a quayage length of over 8000 yds. The public institutions of Cettine include tribunals of commerce and of maritime commerce, councils of arbitration in commercial and fishing affairs, an exchange and chamber of commerce, a branch of the Bank of France and a large hospital. There are also a communal college, a naval school, and schools of music, commerce and industry, and navigation. Cettine is much resorted to for sea-bathing. The town is connected with Lyons by the canal from the Rhone to Cette, and with Bordeaux by the Canal du Midi, and is a junction of the Southern and Paris-Lyon railways. The shipping trade is carried on with South America, the chief ports of the Mediterranean, and especially with Spain. The chief exports are wines and brandy, chemical products, skins and soap; the chief imports are wine, cereals, coal, timber, petroleum, sulphur, tar and chemical substances. In the five years 1901-1905 the average annual value of imports was £3,730,000 (£4,980,000 in years 1896-1900), of exports £1,427,000 (£1,237,000 in 1896-1900). More than 400 small craft are employed in the sardine, tuna, cod and other fisheries. Large quantities of shell-fish are obtained from the lagoon of Thau. There are factories for the pickling of sardines, for the manufacture of liqueurs and casks, and for the treatment of sulphur, phosphates, and nitrate of soda. The Schneider Company of Creusot also have metallurgical works at Cette, and the establishments for making wine give employment to thousands. The port of Cette was created in 1666 by the agency of Colbert, minister of Louis XIV., and according to the plans of Vauban; toward the end of the 17th century its development was aided by the opening of the Canal du Midi.

CETTIGNE (Servian, Tettine; also written Cettinje, Tečetinje, and Tsettinje), the capital of Montenegro; in a narrow plain, deeply sunk in the heart of the limestone mountains, at a height of 2093 ft. above the sea. Pop. (1900) about 3200. The surrounding country is bare and stony, with carefully cultivated patches of rich red soil among the crevices of the rock. In winter it is often so deeply covered with snow as to be well-nigh inaccessible, while in spring and autumn it is frequently flooded by the waters of a small brook which becomes a torrent after rain or a thaw. Cettigne itself is little more than a walled village, consisting of a cluster of whitewashed cottages and some unadorned public buildings. These include a church; a fortified monastery/which was founded in 1478, but so often burned and rebuilt as to seem quite modern, and which is visited by pilgrims to the tomb of Peter I. (1782–1830); residences for the archimandrite and the zadika or metropolitan of Cettigne; a palace built in 1863, which accommodates the minstrels; the court of appeal, and a school modelled on the gymnasia of Germany and Austria; the newer palaces of the prince and his heir; a foreign legations; barracks; a seminary for priests and teachers, established by the tsar Alexander II. (1855–1881), with a very successful girls’ school founded and endowed by the tsaritsa Marie; a library and reading-room; a theatre, a museum and a hospital. In an open space near the old palace stood the celebrated plane tree, beneath which Prince Nicholas gave audience to his subjects, and administered justice until the closing years of the 19th century. A zigzag highway, regarded as a triumph of engineering, winds through the mountain passes between Cettigne and the Austrian seaport of Cattaro; and other good roads give access to the richest parts of the interior. There is, however, little trade, though mineral waters are manufactured.

Cettigne owes its origin to Ivan the Black, who was forced, towards the end of the 15th century, to withdraw from Zabljak, his former capital. It has often been taken and sacked by the Turks, but has seldom been occupied by them for long.
August 1882. He remained in England less than a month, during which time the government (the second Gladstone administration) announced that they had decided upon his restoration. To his great disappointment, however, restoration proved to refer only to a portion of his old kingdom. Even there one of his kinsmen and chief enemies, Usibepu, was allowed to retain the territory allotted to him in 1789. Ceywayo was reinstalled on the 26th of January 1883 by Shepstone, but his enemies, headed by Usibepu, attacked him within a week, and after a struggle of nearly a year's duration he was defeated and his kraal destroyed. He then took refuge in the Native Reserve, where he died on the 8th of February 1884. For a quarter of a century he had been the most conspicuous native figure in South Africa, and had been the cause of long and bitter political controversy in Great Britain.

His son Dinizulu afterwards attempted to become king, was exiled (1886) to St Helena, permitted to return (1888), and granted the position of a chief. In December 1907 Dinizulu was imprisoned at Maritzburg, being suspected of complicity in the revolt which had occurred in Zululand the previous year. He was kept many months waiting trial, there being considerable friction between the colonial government and the British government over the incident. He was eventually brought to trial in November 1908 before a special court, his defence (to the cost of which the British government contributed £2000) being undertaken by Mr W. P. Schreiner. The trial was not concluded until March 1909. The charge of high treason was not proved, but Dinizulu was convicted of harbouroing rebels and was sentenced to four years' imprisonment.

The Life of Sir Barth Frere, by John Martineau, vol. ii. chaps. 18 to 21, contains much information concerning Ceywayo.

CEUTA (Arabic Sebda), a Spanish military and convict station and seaport on the north coast of Morocco, in 35° 54' N., 5° 18' W. Pop. about 13,000. It is situated on a promontory connected with the mainland by a narrow isthmus. This promontory marks the south-eastern end of the straits of Gibraltar, which between Ceuta and Gibraltar leave a width of 14 m. The promontory terminates in a bold headland, the Montagne des Singes, with seven distinct peaks. Of these the highest is the Monte del Hacko, the ancient Abyla, one of the "Pillars of Hercules," which faces Gibraltar and rises 636 ft. above the sea. On the westernmost point—Almina, 476 ft. high—is a lighthouse with a light visible for 23 m. Ceuta consists of two quarters, the old town, covering the low ground of the isthmus, and the modern town, built on the hills forming the north and west faces of the peninsula. Between the old and new quarters and on the north side of the isthmus lies the port. The public buildings in the town, thoroughly Spanish in its character, are not striking: they include the cathedral (formerly a mosque), the governor's palace, the town hall, barracks, and the convict prison in the old convent of San Francisco. Ceuta has been fortified seaward, the works being furnished with modern artillery intended to command the entrance to the Mediterranean. Landward are three lines of defence, the inner line stretching completely across the isthmus. These fortifications, which date from the time of the Portuguese occupation, have been partly modernized. The citadel, El Hacho, built on the neck of the isthmus, dates from the 15th century. The garrison consists of between 3000 and 4000 men, inclusive of a disciplinary corps of military convicts. Of the rest of the population about 2000 are civilian convicts; and there are colonies of Jews, negroes and Moors, the last including descendants of Moors transferred to Ceuta from Oran when Spain abandoned that city in 1796.

Ceuta occupies in part the site of a Carthaginian colony, which was succeeded by a Roman colony said to have been called Ad Septem Frates and also Esilissa or Lissa Civitas. From the Romans the town passed to the Vandals and afterwards to Byzantium, the emperor Justinian restoring its fortifications in 535. In 685 the town, then known as Septon, fell into the hands of the Visigoths. It was the last stronghold in North Africa which held out against the Arabs. At that date (A.D. 711) the governor of the town was the Count Julian who, in revenge for the betrayal of his daughter by King Roderick of Toledo, invited the Arabs to cross the straits under Tarik and conquer Spain for Islam. By the Arabs the town was called Cibla or Sebta, hence the Spanish form Ceuta. From the date of its occupation by the Arabs the town had a stormy history, being repeatedly captured by rival Berber and Spanish-Moorish dynasties. It became nevertheless an important commercial and industrial city, being noted for its brass ware, its trade in ivory, gold and slaves. It is said to have been the first place in the West where a paper manufactury was established. In 1415 the town was captured by the Portuguese under John I., among those taking part in the attack being Prince Henry "the Navigator" and two of his brothers, who were knighted on the day following in the mosque (hastily dedicated as a Christian church). Ceuta passed to Spain in 1580 on the subjugation of Portugal by Philip II., and was definitely assigned to the Spanish crown by the treaty of Lisbon in 1668. The town had been several times unsuccessfully besieged by the Moors— one siege under Moatel Ismail, lasting twenty-six years (1649-1716). In 1810, with the consent of Spain, it was occupied by British troops under General Sir J. F. Fraser. The town was restored to Spain by the British at the close of the Napoleonic Wars. As the result of the war between Spain and Morocco in 1860 the area of Spanish territory around the town was increased. The military governor of the town also commands the troops in the other Spanish stations on the coast of Morocco. For civil purposes Ceuta is attached to the province of Cadiz. It is a free port, but does little trade.

See de Prado, Recuerdos de Africa; historia de la plasa de Ceuta (Madrid, 1859-1860); Budgett Meakin, The Land of the Moors (London, 1901), chap. xix., where many works dealing with Spanish Morocco are cited.

CEVA, a town of Piedmont, Italy, in the province of Cuneo, 33 m. E. by rail from the town of Cuneo, 1270 ft. above sea-level. Pop. (1901) 2703. In the middle ages it was a strong fortress defending the confines of Piedmont towards Liguria, but the fortifications on the rock above the town were demolished in 1800 by the French, to whom it had been ceded in 1766. Its cheese (caseus cebanus) was famous in Roman times, but it does not seem ever to have been a Roman town. It lay on the road between Augustus Taurinorum and Vada Sabatia. A branch railway runs from Ceva through Garessio, with its marble quarries, to Ormea (2308 ft.), 22 m. to the south through the upper valley of the Tanaro, which in Roman times was under Albignaunum (Th. Mommsen in Corp. Insocr. Lat. v., (Berlin, 1877), p. 808). From Ormea a road runs south to (31 m.) Ongelia on the Ligurian coast.

CÉVENNES (Lat. Cebenna or Gebenna), a mountain range of southern France, forming the southern and eastern fringe of the central plateau and part of the watershed between the Atlantic and Mediterranean basins. It consists of a narrow ridge some 320 m. long, with numerous lofty plateaus and secondary ranges branching from it. The northern division of the range, which nowhere exceeds 3320 ft. in height, extends, under the name of the mountains of Charolais, Beaujolais and Lyonnais, from the Col de Longpied (west of Chalon-sur-Saône) in a southerly direction to the Col de Gier. The central Cévennes, comprising the volcanic chain of Vivarais, incline south-east and extend as far as the Lozère group. The northern portion of this chain forms the Boutières range. Farther south it includes the Gerbier des Joncs (5089 ft.), the Mont de Mézenc (5755 ft.), the culminating point of the entire range, and the Tanargue group. South of the Mont Lozère, where the Pic Finiels reaches 5584 ft., lies that portion of the range to which the name Cévennes is most strictly applied. This region, now embraced in the departments of Lozère and Gard, stretches south to include the Aigoulas and Espérou groups. Under various local names (the Garrigue, the mountains of Espinouse and Lacaze) and with numerous offshoots the range extends south-east and then east to the Montagne Noire, which runs parallel to the Canal du Midi and comes to an end some 25 m. east of Toulouse. In the south the Cévennes separate the cold and barren tablelands.
known as the Causses from the sunny region of Languedoc, where the olive, vine and mulberry flourish. Northwards the contrast between the two slopes is less striking.

The Cévennes proper are formed by a folded belt of Palaeozoic rocks which lies along the south-east border of the central plateau of France. Concealed in part by later deposits, this ancient mountain chain extends from Castelnauaudry to the neighbourhood of Valence, where it sinks suddenly beneath the Tertiary and recent deposits of the valley of the Rhone. It is in the Montagne Noire rather than in the Cévennes proper that the structure of the chain has been most fully investigated. All the geological systems from the Cambrian to the Carboniferous are included in the folded belt, and J. Bergeron has shown that the gneiss and schist which form so much of the chain consist, in part at least, of metamorphosed Cambrian beds. The direction of the folds is about N. 60° E., and the structure is complicated by overthrusting on an extensive scale. The overthrust came from the south-east, and the Palaeozoic beds were crushed and crumpled against the ancient massif of the central plateau.

The principal folding took place at the close of the Carboniferous period, and was continued through much of the Trias and the late Cretaceous strata by a belt of Cévennes which includes the Montagne Noire, the Cévennes, the Baronnies, the Velay, the Vivarais, the Mont Lozère, and the Drôme. A great number of the formations of the upper part of the Palaeozoic series are here crushed and deformed. The Palaeozoic beds are again overthrust by the Trias of the massif of the central plateau, and the overthrust is repeated from below upwards, including the Trias and the Tertiary systems. Although the chain was completed in Palaeozoic times, a second folding took place along its south-east margin at the close of the Eocene period. The Secondary and Tertiary beds of the Languedoc were crushed against the central plateau and were frequently overlaid. But by this time the ancient Palaeozoic chain had become a part of the unyielding massif, and the folding did not extend beyond its foot.

As the division between the basins of the Loire and the Garonne to the west and those of the Saône and Rhone to the east, the Cévennes send many affluents to those rivers. In the south the Orb, the Héraud and the Vidourle are independent rivers flowing to the Golfe du Lion; farther north, the Gard—formed by the union of several streams named Gardon—the Cèze and the Ardèche flow to the Rhone. The Vivarais mountains and the northern Cévennes approach the right banks of the Rhone and the Saône closely, and on that side send their waters by way of short torrents to those rivers; on the west side the streams are tributaries of the Loire, which rises at the foot of Mont Mézenc. A short distance to the south on the same side are the sources of the Allier and Lo. The waters of the north-western slope of the southern Cévennes drain into the Tarn either directly or by way of the Aveyron, which rises in the outlying chain of the Lévezou, and, in the extreme south, the Agout. The Tarn itself rises on the southern slope of the Mont Lozère.

In the Lozère group and the southern Cévennes generally, good pasturage is found, and huge flocks spend the summer there. Silkworm-rearing and the cultivation of peaches, chestnuts and other fruits are also carried on. In the Vivarais cattle are reared, while on the slopes of the Beaujolais excellent wines are grown.

The chief historical event in the history of the Cévennes is the revolt of the Camisards in the early years of the 18th century (see Camisards). For a long period Adam's Peak was supposed to be the highest mountain in Ceylon, but actual survey makes it only 7353 ft. above sea-level. This elevation is chiefly remarkable as the resort of pilgrims from all parts of the East. The hollow in the lofty rock that crowns the summit is said by the Brahmins to be the footstep of Siva, by the Buddhists of Buddha, by the Mahomedans of Adam, whilst the Portuguese Christians were divided between the conflicting claims of St Thomas and the Tuch of Candace, queen of Ethiopia. The footstep is covered by a handsome rock and is encircled by the priests of a rich monastery half-way up the mountain, who maintain a temple on the summit of the peak. The highest mountains in Ceylon are Pidurutalagala, 8296 ft. in altitude; Kirigalpota, 7836 ft.; and Totapalakanda, 7746 ft.

The summits of the highest ridges are clothed with verdure, and along their base, in the beautiful valleys which intersect them in every direction, the slopes were formerly covered with forests of gigantic and valuable trees, which, however, have disappeared under the axe of the planter, who felled and burnt the timber on all the finest slopes at an elevation of 2000 to 4500 ft., and converted the hillsides into highly cultivated coffee and on the opposite coast there exist two open channels of varying depth and width, beset by rocks and shoals. One of these, the Mannaar Passage, is only navigable by very small craft. The other, called the Paumen Passage, lying between Rameswaran and the mainland, has been deepened at considerable outlay, and is used by large vessels in passing from the Malabar to the Coromandel coast, which were formerly compelled in doing so to make the circuit of the island. The west and south coasts, which are uniformly low, are fringed their entire length by coconut trees, which grow to the water's edge in great luxuriance, and give the island a most picturesque appearance. Along these shores there are numerous inlets and backwaters of the sea, some of which are available as harbours for small native craft. The east coast from Point de Galle to Trincomalee is of an entirely opposite character, wanting the ample vegetation of the other, and being at the same time of a bold precipitous character. The largest ships may freely approach this side of the island, provided they take care to avoid a few dangerous rocks, whose localities, however, are well known to navigators.

Ceylon, a large island and British colony in the Indian Ocean, separated on the N.W. from India by the Gulf of Manaar and Balk Strait. It lies between 5° 55' and 6° 51' N. and between 79° 41' and 81° 54' E. Its extreme length from north to south is 271 ft.; its greatest width is 133 1/2 m.; and its area amounts to 25,481 sq. m., or about five-sixths of that of Ireland. In its general outline the island resembles a pear, the apex of which points towards the north.

The coast is beset on the N.W. with numberless sandbanks, rocks and shoals, and may be said to be almost connected with the island and...
The plain of Nuwara Eliya, the sanatorium of the island, is at an elevation of 6200 ft., and possesses many of the attributes of an alpine country. The climate of the Horton plains, at an elevation of 7000 ft., is still finer than that of Nuwara Eliya, but they are not, of course, so rich in vegetation, and are but little known to Europeans. The town of Kandy, in the Central Province, formerly the capital of the native sovereigns of the interior, is situated at 1727 ft. above sea-level.

The island, though completely within the influence of oceanic evaporation, and possessing an elevated tableland of considerable extent, does not boast of any rivers of great volume. The rains which usher in each monsoon or change of season are indeed heavy, and during their fall swell the streams to torrents and impetuous rivers. But when these cease the watercourses fall back to their original state, and there are few of the rivers which cannot generally be passed on horseback. The largest river, the Mahawelianga, has a course of 206 m., draining about one-sixth of the area of the island before it reaches the sea at Trincomalee on the east coast. There are twelve other considerable rivers, running to the west, east and south, but none of them exceed 50 m. in length. The rivers are not favourable for navigation, except near the sea, where they expand into backwaters, which were used by the Dutch for the construction of their system of canals all round the western and southern coasts. Steamers ply between Colombo and Negombo on this narrow canal and lake. A similar service on the Kaluganga did not prove a success. There are no inland lakes except the remains of magnificent artificial lakes in the north and east of the island, and the backwaters on the coast. The lakes which add to the beauty of Colombo, Kandy, Lake Gregory, Nuwara Eliya and Kurunegala are artificial or partly so. Giant's Tank is said to have an area of 6380 acres, and Minneri and Kalaweva each exceed 4000 acres.

The magnificent basin of Trincomalee, situated on the east coast of Ceylon, is perhaps unsurpassed in extent, security and beauty by any haven in the world. The admiralty had a dockyard here which was closed in 1905.

Geology.—Ceylon may be said to have been for ages slowly rising from the sea, as appears from the terraces abounding in marine shells, which occur in situations far above high-water mark, and at some miles distance from the sea. A great portion of the north of the island may be regarded as the joint production of the coral polyps and the currents, which for the greater part of the year set impetuously towards the south; coming laden with alluvial matter collected along the coast of Coromandel, and meeting with obstacles south of Point Calimere, they have deposited their burdens on the coral reefs round Point Pedro; and these, raised above the sea-level and covered deeply by sand drifts, have formed the peninsula of Jaffna, and the plains that trend westward till they unite with the narrow causeway of Adam's Bridge. Tertiary rocks are almost unknown. The great geological feature of the island is the profusion of gneiss, overlaid in many places in the interior by extensive beds of dolomite limestones. This formation appears to be of great thickness; and when, as is not often the case, the under-surface of the gneiss series is exposed, it is invariably found resting on granite. Veins of pure quartz and felspar of considerable extent have been frequently met with in the gneiss; while in the elevated lands of the interior in the Galle districts may be seen copious deposits of disintegrated felspar, or kaolin, commonly known as porcelain clay. At various elevations the gneiss may be found intersected by veins of trap rock, upheaved whilst in a state of fusion subsequent to the consolidation of the former. In some localities on the seashore these veins assume the character of pitch-stone porphyry highly impregnated with iron. Hornblende and primitive greenstone are found in the vicinity of Adam's Peak and in the Pussellawa district. Laterite, known in Ceylon as kabuk, a product of disintegrated gneiss, exists in various quantities in many parts, and is quarried for building purposes.

Climate.—The seasons in Ceylon differ very slightly from those prevailing along the coasts of the Indian peninsula. The two distinctive monsoons of the year are called, from the winds which accompany them, the south-west and the north-east. The former is very regular in its approach, and may be looked for along the south-west coast between the 10th and 20th of May; the latter reaches the north-east coast between the end of October and the middle of November. There is a striking contrast in the influence which the south-west monsoon exerts on the one side of the island and on the other. The clouds are driven against the lofty mountains that overhang the western and southern coasts, and their condensed vapours descend there in copious showers. But the rains do not reach the opposite side of the island: while the south-west is deluged, the east and north are sometimes exhausted with dryness; and it not unfrequently happens that different sides of the same mountains present at the same moment the opposite extreme of droughts and moisture. The influence of the north-east monsoon is more general, reducing the difficulties which face the north-eastern are loth and more remote from the sea than those on the south-west; the clouds are carried farther inland, and it rains simultaneously on both sides of the island.

The length of the day, owing to the proximity of the island to the equator, does not vary more than an hour at any season. The mean time of the rising of the sun’s centre at Colombo on February 1st is 6° 23′ a.m., and of its setting 6° 23′ p.m. On August 9th its rising is at 5° 43′ a.m., and its setting at 6° 27′ p.m. It is mid-day in Colombo when it is morning in England. Colombo is situated in 70° 30′ E., and the day is further advanced there than at Greenwich by 5° 10′ 23″.

Flora.—The characteristics of the low-growing plants of Ceylon approach nearly to those of the coasts of southern India. The Rhizophorae are numerous along the low muddy shores of salt lakes and stagnant pools; and the acacias are equally abundant. The first list includes Acacia Stillbergiana, A. reichii, A. horrida, A. populnea, Feronia elephantum, Salvadoria persica (the true mustard tree of Scripture), Eugenia brasolata, Elaeodendron Roxburghii, Cassia Fistula, Cassia Roxburghii, &c. The herbaceous plants of the low country belong mostly to the natural orders Compositae, Leguminosae, Rosaceae, and Umbelliferae.

Leaving the plains of the maritime country and ascending a height of 4000 ft. in the central districts, we find both herbage and trees assume an altered character. The foliage of the latter is larger and deeper coloured, and they attain a height unknown in the hot low country. The herbaceous vegetation is there made up of ferns, Cyrtandrae, Compositae, Scitamineae and Urticaceae. The dense masses of lofty forest at that altitude are interspersed with large species of grass, called 'wax', cultivated as a manure, and of value to them as affording pasturage for their cattle.

Between the altitudes of 4000 and 8000 ft., many plants are to be met with partaking of European forms, yet blended with tropical characteristics. Such plants are: Spiroplegma, Distillery or pitcher plant, violets, geraniums, butternuts, sundews, ladies’ mantles and campionvuls driven by the side of Magnoliacese, Rubiaceae, Elaeocarpaceae, &c. The most beautiful flowering plant of the island is the pitcher tree, which in many instances grows to the height of 70 ft. It is met with in great abundance in the moist plains of the elevated land above Nuwara Eliya, flowering abundantly in June and July. There are two distinct varieties, one similar to the Nilgiri plant, having leaves broad and cordate, and of a rusty colour on the under side; the other, peculiar to Ceylon, is found only in forests at the loftiest elevations; it has narrow rounded leaves, silvery on the under side, and with the stem and leaves covered with fine silvery hairs. At these altitudes English flowers, herbs and vegetables have been cultivated with perfect success, as also wheat, oats and barley. English fruit-trees grow, but rarely bear. Grapes are grown successfully in the north of the island. The vines were introduced by the Dutch, who overcame the difficulty of perpetual summer by exposing the roots, and thus giving the plants an artificial winter.

The timber trees indigenous to Ceylon are met with at every altitude. The highest of the island, it may be observed, vary much in their hardness and durability, from the common cashew-nut tree, which when felled decays in a month, to the ebony and satinwood, which for many years resist the attacks of insects and man. Mahogany and rosewood are found in good beds and house and shipbuilding, and are capable of standing long exposure to weather. The most beautiful woods adapted to furniture work are the calamander, ebony, flowering satinwood, tamarind, neulon, dell, kudumberiah, kilit, coco-nut, &c.; the sack-yielding tree (Antiaris succedanea), for a long time confounded with the far-famed upas tree of Java (Antiaris toxica), grows in the Kuruwagala district of the island. The Cocos nucifera, or coco-nut palm, is a native of the island, and may justly be considered the most valuable
———

CEYLON

of its trees.
It grows in vast abundance along the entire sea-coast
of the west and south sides of the island, and furnishes almost all
that a Sinhalese villager requires. Its fruit, when green, supplies food
and drink; when ripe, it yields oil. The juice of the unopened
flower gives him toddy and arrack. The fibrous casing of the fruit
when woven makes him ropes, nets, matting. The nut-shells form
drinking-vessels, spoons, &c. The plaited leaves serve as plates and

sawn up is employed for every possible purpose, from knife-handles
to door-posts; hollowed out it forms a canoe or a coffin. There are
four kinds of this palm the common, the king, the dwarf and the
Maldive. The Palmyra and Areca palms grow luxuriantly and
abundantly, the former in the northern, the latter in the western
and central districts. The one is valuable chiefly for its timber, of
which large quantities are exported to the Indian coasts; the other
supplies the betel-nut in common use amongst natives of the eastern

nut palm among the indigenous products of Ceylon is the cinnamon
plant, yielding the well-known spice of that name.
Fauna. Foremost among the animals of Ceylon is the elephant,
which, though far inferior to those of Africa and the Indian continent,
is nevertheless of considerable value when tamed, on account of its
They are to be met with in greater
strength, sagacity and docility.
or less numbers throughout most unfrequented parts of the interior.
Occasionally they make inroads in herds upon the cultivated grounds
and plantations, committing great damage. In order to protect
these lands, and at the same time keep up the government stud of
draught elephants, " kraals " or traps on a large scale are erected
in the forests, into which the wild herds are driven; and once secured
they are soon tamed and fit for service. The oxen are of small size,
but hardy, and capable of drawing heavy loads. Buffaloes exist in

—

great numbers throughout the interior, where they are employed
in a half-tame state for ploughing rice-fields and treading out the
They feed upon any coarse grass, and can therefore be maintained on the village pasture-lands where oxen would not find
support. Of deer, Ceylon possesses the spotted kind {Axis maculata),
the muntjac (Stylocerus muntjac), a red deer (the Sambur of India),
popularly called the Ceylon elk (Musa Aristotelis) and the small
musk (Moschus minima). There are five species of monkeys, one
the small rilawa (Macacus pileatus), and four known in Ceylon by
the name of " wandaru " (Presbytes ur sinus, P. Ther sites, P. cephalopterus, P. Priamus), and the small quadrumanous animal, the loris
Of the Cheiroptera
(Loris gracilis), known as the " Ceylon sloth."
sixteen species have been identified; amongst them is the rousette
Of the Carnivora the only one
or flying fox (Pteropus Edwardsii).
dangerous to man is the small black bear (Prochilus labiatus). The
tiger is not known in Ceylon, but the true panther (Felis pardus) is
common, as is the jackal (Canis aureus) and the mongoose or ichneumon (Herpestes vitticollis). Rats are numerous, as are the
squirrel and the porcupine, and the pig-rat or bandicoot (Mus bandicota), while the scaly ant-eater (Mams pentedactyla) locally known
by the Malay name of pangolin, is occasionally found. The dugong
(Halicore dugong) is frequently seen on various points of the coast.
A game preservation society and the judicious action of government
have done much to prevent the wanton destruction of Ceylon deer,
elephants, &c, by establishing a close season.
It is estimated that
there must be 5000 wild elephants in the Ceylon forests. A licence
to shoot or capture and an export royalty are now levied by governcorn.

,

ment.
Captain V. Legge includes' 371 species of birds in Ceylon, and many
of them have splendid plumage, but in this respect they are surpassed
by the birds of South America and Northern India. The eagles are
small and rare, but hawks and owls are numerous; among the latter
is a remarkable brown species, the cry of which has earned for it
the name of the " devil-bird." The esculent swift, which furnishes
in its edible nest the celebrated Chinese dainty, builds in caves in
Ceylon. Crows of various species are numerous, and in the wilder
There are also to be mentioned kingparts pea-fowl are abundant.
fishers, sun-birds, several beautiful fly-catchers and snatchers, the
oriole, parroquets and numerous pigeons, of which there are
The Ceylon jungle-fowl (Gallus Lafayetti)
at least a dozen species.
is distinct from the Indian species.
Ceylon is singularly rich in
wading and water birds— ibises, storks, egrets, spoonbills and herons
being frequently seen on the wet sands, while flamingoes line the
beach in long files, and on the deeper waters inland are found teal
and a countless variety of ducks and smaller fowl. Of the birds
familiar to European sportsmen there are partridge, quail and snipe

golden

in abundance, and the woodcock has been seen.
The poisonous snakes of Ceylon are not numerous. Four species
have been enumerated the ticpolonga (Daboia elegans), the cobra
di capello (Naja tripudians), the carawilla (Trigonocephaly hypnale),
and the Trigonocephaly nigromarginatus, which is so rare that it ha9
no popular name. The largest snake in Ceylon is the " boa," or
"anaconda" of Eastern story (Python reticulatus) it is from
20_to 30 ft. in length, and -preys on hog-deer and other smaller
animals. Crocodiles infest the rivers and estuaries, and the large
fresh-water reservoirs which supply the rice-fields; there are two
species (C. biporcatns and C. palustris).
Of lizards the most note-

—

;

worthy are the iguana, several bloodsuckers, the diameleon and the
familiar geckoes, which are furnished with pads to each toe, by
which they are enabled to ascend perpendicular walls and adhere to
glass and ceilings.
Insects exist
great numbers. The leaf and stick insects are of
great variety and beauty. Ceylon has four species of the ant-lion,
renowned for the predaceous ingenuity of its larvae; and the white
ants or termites, the ravages of which are most destructive, aTe at
once ubiquitous and innumerable in every place where the climate
is not too chilly or the soil too sandy for them to construct their
domed dwellings. They make their way through walls and floors,
and in a few hours destroy every vegetable substance within their
reach.
Of all the insect pests that beset an unseasoned European
the most annoying are the mosquitoes. Ticks are also an intolerable

m

nuisance; they are exceedingly minute, and burrow under the skin.
In the lower ranges of the hill country land leeches are found in
tormenting profusion. But insects and reptiles do not trouble European residents so much as in early years at any rate in the towns,
while in the higher planting districts there is almost complete
exemption from their unwelcome attentions. Bungalows are more
carefully built to resist white ants, drainage and cleanliness prevent
mosquitoes and ticks from multiplying, while snakes and leeches
avoid cultivated, occupied ground.
Of the fish in ordinary use for the table the finest is the seir, a
species of scomber (Cybium guttatum).
Mackerel, dories, carp,
whitings, mullet (red and striped), soles and sardines are abundant.
Sharks appear on all parts of the coast, and the huge saw fish (Pristis
antiquorum) infests the eastern coast of the island, where it attains
a length of 12 to 15 ft. There are also several fishes remarkable for
the brilliancy of their colouring e.g. the Red Sea perch (Holocentrunt
rubrum), of the deepest scarlet, and the great fire fish (Scorpaena

—

;

miles), of a brilliant red. Some are)purple, others yellow, and numbers
with scales of a lustrous green are called " parrots " by the natives;
of these one (Sparus Hardwichii) is called the " flower parrot," from
its exquisite colouring
irregular bands of blue, crimson and purple,
green, yellow and grey, crossed by perpendicular stripes of black.
The pearl fishery, as indicated below, is of great importance.
Population. The total population of Ceylon in 1901, inclusive
of military, shipping and 4914 prisoners of war, was 3,578,333,
showing an increase of i8-8% in the decade. The population of

—

Language. The language of nearly 70% of the population is
Sinhalese, which is nearly allied to Pali (q.v.) of the remaining
30%, with the exception of Europeans, the language is Tamil. A
corrupt form of Portuguese is spoken by some natives of European
descent. The Veddahs, a small forest tribe, speak a distinct language,
and the Rodiyas, an outcast tribe, possess a large vocabulary of their
own. The Sinhalese possess several original poems of some merit,
and an extensive and most interesting series of native chronicles, but
their most valuable literature is written in Pali, though the greater
portion of it has been translated into Sinhalese, and is best known
to the people through these Sinhalese translations.
Religion.
The principal religions may be distributed as follows:
Christians,
Hindus, 826,826;
Buddhists, 2,141,404;
349,239;
Mahommedans, 246,118. Of the Christians, 287,419 are Roman
Catholics, and 61,820 are Protestants of various denominations;
and of these Christians 319,001 are natives, and 30,238 Europeans.
The Mahommedans are the descendants of Arabs (locally termed
Moormen) and the Malays. The Tamils, both the inhabitants of the
island and the immigrants from India, are Hindus, with the exception
of 93,000 Christians.
The Sinhalese, numbering 70% of the whole
;

—


population, are, with the exception of 180,000 Christians, Buddhists. Ceylon may properly be called a Buddhist country, and it is here that Buddhism is found almost in its pristine purity. Ceylon was converted to Buddhism in the 3rd century B.C. by the great Auguste of Ashoka, who sent a message of the上来文中的内容 to the inhabitants. The lowlands, tensive ruins throughout Ceylon, especially in the ancient cities of Anuradhapura and Polonnaruwa, bear witness to the sacrifices which kings and people joined in making to create lasting monu-
mements. The blacksmiths’ work, others the carpenters’, while another set of tenants had to cultivate the land reserved for supplying the monastery; others again had to attend at the festivals, and prepare decorations, lamps, and the like. As the difficulties arose; the English courts were aware to a system under which the rent of lands was paid by hereditary service, and a com-
mission was issued by Sir Hercules Robinson (afterwards Lord Rendel) which directed that the lands of the missionary were to be let under the terms.

Education.—There has been a great advance in public instruction since 1875, through the multiplication of vernacular, Anglo-ver-
nacular and English schools by government, by the different Ceylonese and, in the last few years, by the Missionaries. This has come forward to claim the government grant. The government has also started a technical college, and an agricultural school has been reorganised. An agricultural department, recommended by a commission, should profit by the services of the ethnologist, mycologist and chemical analyst added by the governor to the staff of the royal botanic gardens at Peradeniya. There are industrial and reformatory schools, which are partially supported by govern-
ment. The number of missionaries who have advanced education is at the census of 1901 no fewer than 2,790,235 of the total population were entered as unable to read or write their own tongue. Of this number, 1,553,078 were females, showing a very unsatisfactory state of education.

Agriculture.—The natural soils of Ceylon are composed of quartzose gravel, felspathic clay and sand often of a pure white, blended with or overlaid by brown and red clays, resulting from the weathering of granite and hornblende forming the whole of the great northern extremity of the island consists of a sandy and calcareous admixture, made to yield productive crops of grain, tobacco, cotton and vege-
tables. The valley of this country is composed of quartzose sand with no pains in irrigating and manuring their lands. Between the northern districts and the elevated mountain ranges which overlook the Bintenne and Uva countries are extensive plains of alluvial soil which are covered by cultivated land and the irrigation produced large quantities of grain. The remains of ancient works of irrigation bear testimony to the bygone agriculture of these extensive regions now covered by swamps or dense jungle.

Sand.—The sandy soils of the north and west of the island and on the east, south and west is sandy. Large tracts of quartzose sand spread along the whole line of sea-coast, some of which, of a pure white, and very free and vegetable matter, is admirably adapted to the growth of the cinnamon and tobacco plant. In the light sandy districts there are a good many crops of rice, and coconut, and vegetable and mineral oil, the coconut palm flourishes in great luxuriance. This is the case along the entire coast line from Kalpitiya to Point de Galle, and farther eastward and northward to Matara, stretching to the narrow strip of the sandy island of Adam’s peak as far as the sandy belt as far as the mountain-ridge of the Kandy country the land is mainly composed of low hilly undulations of sandstone and ferruginous clay, incapable of any cultivation, but intersected in every direction by accumulated in the bed of the rocks above, blended with the decayed vegetable matter of forests that have for centuries scattered beneath them the germs of fertility. The quantity of really rich coffee land in these districts is but small as compared with the extent of country—vast tracts of open valleys consisting of an indifferent yellow tenacious soil interspersed with many low ranges of quartz rock, but tea is a much harder plant than coffee, and grows on poorer soil.

Irrigation.—The native rulers covered the whole face of the country with an extensive irrigation system, which was in many places adopted in ancient times to be the great granary of southern Asia. Wars, and the want of a strong hand to guide the agriculture of the country, led to the decay of these ancient works, and large tracts of valuable soil lay uncultivated. In 1875, under the British government, the low hills which surround it with an embankment 60 ft. wide at the top, is at this day 20 m. in circumference. It has recently been restored by government, and is capable of irrigating 15,000 acres; which were, in 1861, and 20,000 acres in 1882. Another lake, with an embankment 30 m. in length, the Kalawewa, was formed by damming back the waters of the Kaluva, but they have forced their way through the embank-
ment, and the lake has shrunk to 20,000 acres. Now many small villas. In 1875 there were 350,000 acres dealt with, while 400,000 are turned over to supplying smaller tanks, or for irrigating large tracts of fields. Throughout the district of Nuvarakaliwawa every village has its tank. The embankments have been formed with great skill, as they are by the English department of works, and the waters are kept back by the embankments which are the work of the government, and 100 village tanks were repaired every year, besides eighteen large works. In 1900 a sum of five million rupees was set apart for these larger undertakings. The cultivation of tea is confined to a portion of uncultivated land is little over 3 square miles, whereas fully four times that amount is capable of cultivation. A great deal is waste, besides lagoons, tanks, back-
waters, &c. Thick forest land does not cover more than 3,000 sq. m. Serpentine, ceylonese, jack, and pinnah, which are used in tobacco factories, in which the cacao, cardamom, cinchona, coffee and indiarubber are the products cultivated by European and an increasing number of native planters in the hill country and part of the low country of Ceylon. A great deal of the land that is capable of being cultivated is devoted to the introduction of the coffee plant in place of the coffee plant, after the total failure of the latter owing to disease. For some time coffee had been the most important crop. In the old days it grew wild like cypress, and was known as wild coffee, and it was very valuable, but it was lightly esteemed as an article of European commerce, and the berry was gathered unripe, was imperfectly cured and had little flavour. In 1824 the government, Sir B. Barnes, introduced coffee cultivation on the West Indian plan; in 1824 the falling off of other sources of supply drew general attention to Ceylon, and by 1841 the Ceylon output had become considerable, and grew steadily (with an interval in 1847 due to a commercial crisis) till 1877 when 272,000 acres were cultivated, the produce amounting to 103,000,000 lb. Then owing to disease came a critical period, and decline, and now only a few thousand acres are left. On the failure of the coffee the tea planters began extensively to grow the tea plant, while the coffee plant grew wild and was cultivated in some parts of the island. By 1882 over 20,000 acres had been planted, and the acre that year was under 700,000 lb. Five years later the area planted was 170,000 acres, while the export had risen to nearly 14,000,000 lb. In 1892 there were 262,000 acres covered with tea, and 71,000,000 lb were exported. In 1894 imports of tea, on the contrary, was little over 50,000,000 lb. A few years later the entire produce of the island was under 50,000,000 lb. By 1875 the tea planters were in a much inferior condition, and a large quantity of tea was shipped, bringing the price of quine down from 16s. to 1s. 6d. an ounce.

In a few places, where the rainfall is abundant, rice cultivation is carried out under police, but with the general distribution of the land the cultivation is not attempted unless there is secured beforehand a certain and sufficient supply, by means of canals or reservoirs. In the hill country every valley and open plain capable of tillage is terraced. Some are even cut into terraces, on which are seen waving patches of green rice watered by mountain streams, which are conducted by means of channels ingeniously carried round the spurs of the hills and along the face of the mountains, by earthen water-courses and bamboo aqueducts, so as to fertilize the fields below. These works bear witness to the patience, industry and skill of the Kandyans. In the low country, to the north and east and north-west of the hills,
irrigation works of a more expensive kind are necessary. In January
1892, the immemorial rent or tax on fields of paddy (rice in the husk)
was removed, but not the customs duty on imported rice. But even
with the advantage of protection to the extent of 10% in the local
markets, there has been no extension of paddy cultivation. In the
contrary, the import of grain from India has grown larger year by
year. Through the multiplication of irrigation works and the
northern railway, rice culture may be sufficiently extended to save
some of the large imports (8,000,000 to 9,000,000 bushels annually)
now made up only by import.

Tobacco is extensively cultivated in various parts of the island,
and the growth of particular places, such as Dambara and Uva,
is much prized for local consumption. The tobacco of export is
grown on a large scale in the western part of the island, and the
crop in 1872 exceeded 22,176 cwt., valued at £26,682. The cultivation of the plant
does not greatly increase of recent years, and is almost entirely in
the hands of natives in the northern and parts of the central Province.

Ceylon is one of the leading spice producers for its cinnamon, and
during the period of the Dutch occupation this spice was the principal article of commerce; under their rule and
up to about 1832 its cultivation was a government monopoly. With
the abolition of the monopoly the quantity exported increased, but the
value declined.

Unlike the coffee plant, the hardy tea plant grows from sea-level
to 7000 ft. altitude; but crown forest-lands above 5000 ft. are no
longer sold, so that a very large area on the highest mountain ranges
and plateaus is still under forest. Moreover, on the tea plantations
arboriculture is attended to in a way unknown in 1875: the; Aus-
tralian eucalyptus, acacias and grevilleas, Indian and Japanese
conifers, and other trees of different lands, are being selected for
planting. Although firewood is now procured from the plantations;
the commerical extinction of forests after the Indian system has been taken in hand
under a director and trained officers, and much good has been done.
The cinnamon tree (wild in the jungles, cultivated as a shrub in the
plantations) is thus being progressively planted and the resurrection of the cinnamon is a
strong encouragement to the island. The coco-nut and nearly all other palms
have been introduced.

Among other plantation products mention must be made of
cocoa and coffee, the growth and export of which have steadily extended since
coffee failed. Important also is the spice or aromatic product of
cardamons.
The culture of indigo-dyeing began on low-country plantations,
and is now one of the best quality in the market. The area
of cultivation of the coco-nut palm has been greatly extended
1875 by natives as well as by Europeans. The products of this
coc-nut palm that are exported, apart from those so extensively used in the
island itself for food and firewood, include the copra, which, after being
viticultural and cotton cultivation, as well as tobacco growing, are
being developed along the course of the new northern railway.

Taking the trade in the products mentioned as a whole, no country
can compete with the United Kingdom as a customer of Ceylon.
Ceylon or Ceylonese; Ceylonese is a term used for the
people who have been in the island for generations and whose
language is Sinhalese. Administration, of the island are
under the British government. The Ceylonese, or "Sinhalese,"
is not a term to be used with a blank.

Manufactures.—Little is done save in the preparation in factories
and stores, in Colombo or on the plantations, of the several products
exported. The manufacture of jewellery and preparation of precious
metals, however, is very extensively done in the island, gold and
silver are exported to several thousands. Iron and engineering works
are numerous in Colombo and in the plantations. The Sinhalese
are skilful cabinetmakers and carpenters. The Moormen and Tamils
who go into the island are also skilful cabinet-makers.

Commerce.—There has been very rapid development since 1882, and
the returns for 1903 showed a total value of 223 million sterling.
The principal imports were articles of food and drink (chiefly rice
from India) manufactured metals (with specie), coal, cotton yarn
and goods, oil and spirit, and wood and paper goods. The trade with
China and America; in cardamoms with India; in cinchona with Spain,
Italy, Belgium, Australia, Austria and France; and in one or other
of the products of the coco-nut palm (coco-nuts, coco-nut oil,
cotton goods, etc.) with Belgium, Russia, France, Austria, Australia and Holland.

Pearl Fishery.—Pearl oysters are found in the Tamalagam bay,
near Trincomalee, but the great banks on which these oysters are
usually found are in the Palk, off the northern part of the west coast.
The depth of water is about 70 feet. From the ancient town of Mannar,
the pearl fishery is traced back to Periplus, and it is said that the
pearl fishery was established in Ceylon at a distance of from 16 to 20 m. from the shore.

The pearl fishery is one of the oldest in the world, and is the
principal source of income for the Sinhalese. The pearl oysters
are cultivated, and the pearls are strung and sold by the dozen.

The pearl fishery is the most important industry of the island, and
is a source of great wealth to the Ceylonese. The pearls are
marketed in the capital city of Colombo, where they are
inspected and graded according to their size and quality.

Railways.—The Ceylon railway was completed in 1863, and
extends from Colombo to Kandy, a distance of about 60 miles.

The railway has been a great success, and has opened up the
inner parts of the island to the outside world. The railway
has also been a great boon to the agricultural industry of the island,
as it has made it possible to transport goods and materials
quickly and efficiently. The railway has also been a great benefit to
the tourist industry, as it has made it possible for tourists to travel
quickly and easily around the island. The railway has also
been a great benefit to the tea industry, as it has made it possible
for tea to be transported quickly and efficiently to the
export markets. The railway has also been a great benefit to
the coconut industry, as it has made it possible for coconut
products to be transported quickly and efficiently to the
export markets. The railway has also been a great benefit to
the sugar industry, as it has made it possible for sugar
products to be transported quickly and efficiently to the
export markets.

mainly concerned with the safeguarding of the rights of the hierarchy, but a few contain references to executive acts of the king. An inscriptional reference is made to the Sinhalese paladium, the famous tooth-relic of Buddha, now enshrined at Kandy, and the decree confirms tradition as to the identity of the fine stone temple, east of the Thuparama at Anuradhapura, with the shrine in which the tooth was first deposited when brought from Kalinga in the reign of Kirti Sri Meghavarna (a.d. 304-324).

The earliest inhabitants of Ceylon were probably the ancestors of the modern Veddas, a small tribe of primitive hunters who inhabit the eastern jungles; and the discovery of palaeolithic stone implements buried in some of their caves points to the fact that they represent a race which has been in the island for untold ages. As to subsequent immigrations, the great Hindu epic, the Ramayana, tells the story of the conquest of part of the island by the hero Rama and his followers, who took the capital of its king Rawana. Whatever element of truth there may be in this fable, it certainly represents no permanent occupation.

The authentic history of Ceylon, so far as it can be traced, begins with the landing in 534 B.C. of Vijaya, the founder of the Sinhalese dynasty, with a small band of Aryan-speaking followers from the coastlands of India, and his daughter of a native chief, with whose aid he proceeded to make the whole island, which he parcelled out among his followers, some of whom formed petty kingdoms. The Sinhalese introduced from the mainland a comparatively high type of civilization, notably agriculture. The earliest of the great irrigation tanks, near Anuradhapura, was opened about 504 B.C. by the successor of Vijaya; and about this time was established that system of village communities which still obtains over a large part of Ceylon.

The island was converted to Buddhism at the beginning of the 3rd century B.C. by the preaching of Mahinda, a son of the great Buddhist emperor Asoka; a conversion that was followed by an immense multiplication of dagobhas, curious bell-shaped reliquaries of solid stone, and of Buddhist monasteries. For the rest, the history of ancient Ceylon is largely a monotonous record of Malabar or Tamil invasions, conquests and usurpations. Of these latter the first was in 337 B.C. when two officers in the cavalry and fleet revolted, overthrew the Sinhalese ruler with the aid of his own Tamil mercenaries, and reigned jointly, as Sena I. and Gupta, until 215. The Sinhalese Asela then ruled alone, and was succeeded by his daughter Tanjita, Elala, who held the reins of power for 44 years. In 51 B.C. Elala was defeated and slain by Duttagemunu, still remembered as one of the great Sinhalese heroes of Ceylon. The ruins of the great monastery, known as the Brazen Palace, at Anuradhapura, remain a memorial of King Duttagemunu's splendid and religious zeal. He died in 137 B.C., and thenceforth the history of Ceylon is mainly that of further Tamil invasions, the construction of irrigation tanks, and of the immense development of the Buddhist monastic system. A tragic episode in the royal family in the 5th century A.D. is, however, worthy of notice as connected with one of Ceylon's most interesting remains, the Sigiri rock and tank (see SIGIRI). In A.D. 477 King Datu Sen was murdered by his son, who mounted the throne as Kasaya I., and when he was driven from the capital by the inhabitants, infuriated by his crime, built himself a stronghold on the inaccessible Sigiri rock, whence he ruled the country until in 495 he was overthrown and slain by his brother Mugallana (495-532), who at the time of his father's murder had escaped to India.

Towards the close of the 10th century Ceylon was invaded by Raja R balla the Great, the Chola king, and after a series of protracted campaigns it was annexed, the colosthur being placed in 1006. The island, did not, however, remain long under Tamil domination. In 1071 Vijaya Bahu succeeded in re-establishing the Sinhalese dynasty, and for a while Ceylon was freed from foreign inter-vention. The most notable of the successors of Vijaya Bahu, and indeed of all the long line of Sinhalese rulers, was Parakrama Bahu I. (1155-1180), whose colossal statue still stands near Polonnaruwa. He not only took advantage of the unaccustomed

over 160 m. long, rising to 6200 ft. above sea-level, and falling at the terminus to 4000 ft. The towns of Kandy, Matale, Gampola, Nawalapitiya, Hatton and Haputale (and practically Nuwara Eliya) in the hills, are thus connected by rail, and in the low country the towns of Kurunegala, Galle, Matara, Kalutara, &c. Most of the debt on the railways (all government lines) is paid off, and the traffic receipts now make up nearly one-third of the general revenue. An Indo-Ceylon railway to connect the Indian and Ceylon systems has been the subject of public debate, but engineering difficulties, the Ceylon and Indian governments, who have pronounced the work across the coral reef between Manaar and Rameswaram quite feasible. A commission sat in 1903 to consider the gauge of an Indo-Ceylon railway. Such a line promises to serve strategic as well as commercial purposes, but it would appear that the engineer was unable to frame a programme to impose on the port for southern India. The headquarters of the mail steamers have been removed from Galle to Colombo, where the colonial government has constructed a magnificent breakwater, and undertaken to improve the harbour works which have practically both the external trade and the coasting trade of the island.

Government.—Ceylon is a crown colony, that is, in possession of the British crown acquired by conquest or cession, the affairs of which are administered by a governor, who receives his appointment from the crown, generally for a term of six years. He is assisted by an executive and a legislative council. The executive council acts as the cabinet of the governor, and consists of the attorney-general, the treasurer and auditor-general (nearly, the colonel-secretary, the treasurer and the auditor-general), and the general in command of the forces. The legislative council includes, besides the governor as president and nine official members, eight unofficial members, nominated by the Governor-General in Council, to the so-called "Moornen" having been added in 1890. The term of office for the unofficial members is limited to five years, though the governor may reappoint if he choose. The king's advocate, the deputy-advocate, and the surveyor-general are ex officio members of the council. The style of the governor-general, deputy-governor, and director of public works. The civil service has been reconstituted into five classes, not including the colonial secretary as a staff appointment, nor ten cadets; these five classes number seventy officers. The district judges can punish up to two years' imprisonment, and impose fines up to Rs.1000. The police magistrates can pass sentences up to six months' imprisonment, and impose fines of Rs.150. The criminal law has since 1890 been codified on the model of the Indian penal code, and a uniform civil and criminal code appears all that is necessary of codification. There are twenty-three prisons in the island, mostly small; but convict establishments in and near the capital take all long-sentence prisoners.

Banking.—Ceylon has agencies of the National Bank of India, Bank of Madras, Mercantile Bank of India, Chartered Bank of India, Australia and China, and of the Hong-kong and Shanghai Bank, besides mercantile agencies of other banks, also a government three principal offices of the colony (namely, the colosthur, the bank's deputy-secretary, and the director of public works). In 1884, on the failure of the Oriental Bank, the notes in currency were guaranteed by government, and a government note currency was started in supersession of bank notes. The coin currency of Ceylon is in rupees and decimals of a rupee, the value of the standard following that fixed for the Indian rupees, but is 14d. per rupee.

Finance.—With the disease of the coffee plant the general revenue fell off from its 1890-91 amount of Rs.10,000,000, when the trade was in a very depressed state, and the general prosperity of the island was seriously affected. Since then, however, the revenue has steadily risen with the growing export of tea, cocoa-nut produce, plumbago, &c., and in 1902 it reached a total of 26 millions of rupees.

History.—The island of Ceylon was known to the Greeks and Romans under the name of Taprobane, and in later times Serendib, Sirindull and Zeylan have been employed to designate it by writers of the Western and Eastern worlds. Serendib is a corruption of the Sanskrit Sinhaladhipa. Like most oriental countries, Ceylon possesses a great mass of ancient records, in which fact is so confused with fable that they are difficult to distinguish. The labours of George Tourner (1799-1843), however, helped to dissipate much of this obscurity, and his admirable edition (1836) of the Mahavamsa first made it possible to trace the main lines of Sinhalese history.

The Sinhalese race, to which George Tourner first called attention, and which, through the activity of Sir William Gregory in 1874, began to be accurately transcribed and translated, extend from the 2nd century B.C. onwards. Among the oldest inscriptions discovered are those on the rock-cells of the Vassagiri Vihara of Anuradhapura, cut in the old Brahmi-lipti character. The inscriptions show how powerful was the Buddhist hierarchy which dominated the government and national life. The royal decrees of successive rulers are
tr tranquility of the country to restore the irrigation tanks and the monasteries, but he availed himself of a disputed succession to the Pandya throne of Madura to turn the tables on his Tamil enemies by invading India. According to the Mahabharata his generals met with immediate and unbroken success; according to the more probable account preserved in a long Chola inscription at Arappakam near Kanchi, they were, though at first successful, ultimately driven out by a coalition of the southern princes (V. A. Smith, Early History of India, ed. 1908, p. 411). In any case, within thirty years of Parakrama Bahu’s death his work was undone; the Malabar invaders were once more able to effect a settlement in the island, and the Sinhalese capital was moved farther and farther south, till in 1410 it had become established at Kotta, now a suburb of Colombo. In 1408 a new misfortune had befallen the Sinhalese dynasty; in revenge for an insult offered to a Chinese envoy, a Chinese army invaded the island and carried away King Vijaya Bahu IV. into captivity. For thirty years from this date the Sinhalese kings of Ceylon were tributary to China.

When, in 1505, the Portuguese Francisco de Almeida landed in Ceylon, he found the island divided into seven kingdoms. Twelve years later the viceroy of Goa ordered the erection of a fort at Colombo, and from this time until the advent of the Dutch in the 17th century the Portuguese endeavoured, amid perpetual wars with the native kings, who were assisted by Arab and other traders jealous of European rivalry, to establish their control over the island. They ultimately succeeded so far as the coast was concerned, though their dominion scarcely penetrated inland. Materially their gain was but small, for the trade of Ceylon was quite insignificant; but they had the spiritual satisfaction of prosecuting a vigorous propaganda of Catholicism, St Francis Xavier being the most notable of the missionaries who at this time laboured in the island.

The fanatical zeal and the masterful attitude of the Portuguese were a constant source of dissenion with the native rulers, and when the Dutch, under Admiral Spilberg, landed on the east coast in 1602 and sought the alliance of the king of Kandy in the interior of the island, every inducement was held out to them to aid in expelling the Portuguese. Nothing seems to have come of this until 1638–1639. The Dutch expedition attacked and razed the Portuguese forts on the east coast. In the following year they landed at Negombo, without however establishing themselves in any strong post. In 1644 Negombo was captured and fortified by the Dutch, while in 1656 they took Colombo, and in 1658 they drove the Portuguese from Jaffna, their last stronghold in Ceylon.

Pursuing a wiser policy than their predecessors, the Dutch lost no opportunity of improving that portion of the country which owned their supremacy, and of opening a trade with the interior. More tolerant and less disposed to stand upon their dignity than the Portuguese, they subordinated political to commercial ends, flattened the native rulers by a show of deference, and so far succeeded in their object as to render their trade between the island and Holland a source of great profit. Many new branches of industry were developed. Public works were undertaken on a large scale, and education, if not universally placed within the reach of the inhabitants of the maritime provinces, was at least well cared for on a broad plan of government supervision. That of which they had so much improved by policy, they were, however, unable to defend by force when the British turned their arms against them. A century and a half had wrought great changes in the physical and mental status of the Dutch colonists. The territory which in 1658 they had slowly gained by undaunted and obstinate bravery, they as rapidly lost in 1796 by imbecility and cowardice.

The first intercourse of the English with Ceylon was as far back as 1673, when an embassy was despatched from Madras to the king of Kandy, without, however, leading to any result. On the rupture between Great Britain and Holland in 1795, a force was sent against the Dutch possessions in Ceylon, where the opposition offered was so slight that by the following year the whole of their forts were in the hands of the English commander.

The abiding results of the occupation of Ceylon by the Portuguese and Dutch is described by Sir Emerson Tennent (Ceylon) as follows: "The dominion of the Netherlands in Ceylon was nearly equal in duration with that of Portugal, about 140 years; but the policies of the two countries have left a very different impress on the character and institutions of the people amongst whom they lived. The most important conquest left by the utilitarian genius of the Dutch is the code of Roman Dutch law, which still prevails in the supreme courts of justice, whilst the fanatical propaganda of the Portuguese has reared for itself a monument in the abiding and expanding influence of the Roman Catholic faith. This flourishes in every hamlet and provincial town, and it was amongst the tin-miners, whilst the doctrines of the reformed church of Holland, never preached beyond the walls of the fortresses, are already almost forgotten throughout the island, with the exception of an expiring community at Colombo. Already the language of the Dutch, which they sought to extend by penal enactments, has ceased to be spoken even by their direct descendants, whilst a corrupted Portuguese is to the present day the vernacular of the lower classes in every town of the former Dutch possessions and governed country of the Netherlands only recognized the interest of the native population in so far as they were essential to uphold their trading monopolies, their memory was recalled by no agreeable associations; whilst the Portuguese and Dutch, who were crushed by the weight of the bond of a common faith, excited a feeling of admiration for the boldness of their conflicts with the Kandyans, and the chivalrous though ineffectual defence of their beleaguered fortresses. Their dominions, and their process of decline, had almost ceased to be remembered by the lowland Sinhalese; but the chiefs of the south and west perpetuate with pride the honorific title Don, accorded to them by their first European conquerors, and still prefix to their ancient patronymics the sonorous Christian names of the Portuguese." The British forces by which the island had been conquered were those of the East India Company, and Ceylon was therefore at first placed under its jurisdiction and administered from Madras. The introduction of the Madras revenue system, however, together with a host of Malabar collectors, led to much discontent, which culminated in rebellion; and in 1798 the colony was placed directly under the crown. By the treaty of Amiens, in 1803, this situation was regularized, from the international point of view, by the formal cession to Great Britain of the Netherlands only recognized the interest of the native population in so far as they were essential to uphold their trading monopolies, their memory was recalled by no agreeable associations; whilst the Portuguese and Dutch, who were crushed by the weight of the bond of a common faith, excited a feeling of admiration for the boldness of their conflicts with the Kandyans, and the chivalrous though ineffectual defence of their beleaguered fortresses. Their dominions, and their process of decline, had almost ceased to be remembered by the lowland Sinhalese; but the chiefs of the south and west perpetuate with pride the honorific title Don, accorded to them by their first European conquerors, and still prefix to their ancient patronymics the sonorous Christian names of the Portuguese. Minor differences led in 1803 to an invasion of the Kandyans territory; but sickness, desertion and fatigue proved more formidable adversaries to the British forces than the troops of the Sinhalese monarch, and peace was eventually concluded upon terms by no means favourable to the English. Punishments of the most horrible kinds were inflicted, but failed to repress the popular indignation; and in 1815 the British, at the urgent request of many of the Adigars and other native chiefs, proceeded against the tyrant, who was captured near Kandy, and subsequently exiled for life. By a convention entered into with the Kandyans chiefs on the 2nd of March 1815, the entire sovereignty of the island passed into the hands of the British, who in return guaranteed to the inhabitants civil and religious liberty. The religion of Buddha was declared inviolable, and its rights, ministers and places of worship were to be maintained and protected; the laws of the country were to be preserved and administered according to established forms; and the royal dues and revenues were to be levied as before for the support of government.

With the exception of a serious outbreak in some parts of the interior in 1817, which lasted for upwards of a year, and of two minor attempts at rebellion easily put down, in 1843 and 1848,
the political atmosphere of Ceylon has remained undisturbed since the departure of the last king of Kandy.

A. Herdman, Report on the Pearl Oyster Fisheries, 1903–1904.

CHABAZITE, a mineral species belonging to the group of zeolites. It occurs as white to flesh-red crystals which vary from transparent to translucent and have a vitreous lustre. The crystals are rhombohedral, and the predominant form is often a rhombohedron (r) with interfacial angles of 85° 14'; they therefore closely resemble cubes in appearance, and the mineral was in fact early (in 1772) described as a cubic zeolite. A characteristic feature is the twinning, the crystals being frequently interpenetration twins with the principal axis as twin-axis and is best expressed as an isomorphous mixture of the molecules \((\text{Ca}, \text{Na})_3\text{Al}_2(\text{Si}_4\text{O}_{10})_2+4\text{H}_2\text{O}\) and \((\text{Ca}, \text{Na})_3\text{Al}_2(\text{Si}_4\text{O}_{10})_2+5\text{H}_2\text{O}\), which are analogous to thefeldspars. Most analyses correspond with a formula midway between these extremes, namely, \((\text{Ca}, \text{Na})_3\text{Al}_2(\text{Si}_4\text{O}_{10})_2+4\text{H}_2\text{O}\).

Chabazite occurs with other zeolites in the amygdaloidal cavities of basaltic rocks; occasionally it has been found in gneisses and schists. Well-formed crystals are known from many localities; for example, Kilmalcolm in Renfrewshire, the Giant’s Causeway in Co. Antrim, and Oberstein in Germany. Beautiful, clear glassy crystals of the phacoite (“seebachite”) variety occur with phillipite and radiating bundles of brown calcite in cavities in compact basalt near Richmond, Melbourne, Victoria. Small crystals have been observed lining the cavities of fossil shells from Iceland, and in the recent deposits of the hot springs of Plombières and Bourronnies-les-Bains in France.

Gmelinite and levynite are other species of zeolites which may be mentioned here, since they are closely related to chabazite, and like it are rhombohedral and frequently twinned. Gmelinite forms large flesh-red crystals usually of hexagonal habit, and was early known as soda-chabazite, it having the composition of chabazite but with sodium predominating over calcium. The formula of levynite is \((\text{Ca}, \text{Na})_3\text{Al}_2(\text{Si}_4\text{O}_{10})_2+4\text{H}_2\text{O}.

CHABILS, a town of north-central France, in the department of Yonne, on the left bank of the Serein, 14 m. E. by N. of Auxerre by road. Pop. (1906) 2227. Its church of St Martin belongs to the end of the 12th century. The town gives its name to a well-known white wine produced in the neighbouring vineyards, of which the most esteemed are Clos, Bourguets, Moutonne, Grenouille, Montmaires, Lyons and Vaux-Désirs. There are manufactures of biscuits.

CHABOT, FRANÇOIS (1757–1794), French revolutionist, had been a Franciscan friar before the Revolution, and after the civil constitution of the clergy continued to act as “constitutional” priest, becoming grand vicar of Henri Grégoire, bishop of Blois. Then he was elected to the Legislative Assembly, sitting at the extreme left, and forming with C. Bazire and Merlin de Thionville the “Cordeliers trio.” Re-elected to the Convention he voted for the death of Louis XVI., and opposed the proposal to prosecute the authors of the massacre of September, “because the nation is not yet ready of heart to execute its own laws.” Some of his sayings are well known, such as that Christ was the first “sans-culotte.” Compromised in the falsification of a decree suppressing the India Company and in a plot to bribe certain members of the Convention, especially Fabre d’Eglantine and C. Bazire, he was arrested, brought before the Revolutionary Tribunal, and was condemned and executed at the same time as the Dantonists, who protested against being associated with such a “fripon.”

CHABOT, GEORGES ANTOINE, known as CHABOT DE L’ALLIER (1758–1810), French jurist and statesman, was president of the tribunal of Montluçon when he was elected as a deputy suppléant to the National Convention. A member of the council of the Ancients, then of the Tribunate, he was president of the latter when the peace of Amiens was signed. He had a resolution adopted, tending to give Napoleon Bonaparte the consulsip for life; and in 1804 supported the proposal to establish a hereditary monarchy. Napoleon named him inspector-general of the law schools, then judge of the court of cassation. He published various legal works, e.g. Tableau de la législation générale sur les affaires de famille, and Questions transitoires sur le code civil (Paris, 1804), and Questions transitoires sur le code Napoléon (Paris, 1809).

CHABOT, PHILIPPE DE, SEIGNEUR DE BRION, COUNT OF CHARNY AND BUZANÇANTS (c. 1492–1543), admiral of France. The Chabot family was one of the oldest and most powerful in Poitou. Philippe was a cadet of the Jarnac branch. He was a companion of Francis I. as a child, and on that king’s accession was loaded with honours and estates. After the battle of Pavia he was made admiral of France and governor of Burgundy (1526), and shared with Anne de Montmorency the direction of affairs. He was at the height of his power in 1535, and
commanded the army for the invasion of the states of the duke of Savoy; but in the campaigns of 1536 and 1537 he was eloped by Montmorency, and from that moment his influence began to wane. He was accused by his enemies of rebellion, and condemned on the 10th of February 1541 to a fine of 1,500,000 livres, to banishment, and to the confiscation of his estates. Through the good offices of Madam d'Étampes, however, he obtained the king's pardon almost immediately (March 1541), was reinstated in his posts, and regained his estates and even his influence, while Montmorency in his turn was disgraced. But his health was affected by these troubles, and he died soon afterwards on the 1st of June 1543. His tomb in the Louvre, by an unknown sculptor, is a fine example of French Renaissance work. It was his nephew, Guy Chabot, seigneur de Jarnac, who fought the famous duel with François de Vivonne, seigneur de la Châtaigneraie, in 1547, at the beginning of the reign of Henry II.

The main authorities for Chabot’s life are his MS. correspondence in the Bibliothèque Nationale, Paris, and contemporary memoirs. See also E. de Barthéley, “Chabot de Brion,” in the Revue des questions historiques (vol. xx. 1876); Martineau, L’Amiral Chabot,” in the Positions des thèses de l’École des Chartes (1883).

CHABRIAS (4th century B.C.), a celebrated Athenian general. In 388 B.C. he defeated the Spartans at Aegina and commanded the fleet sent to assist Evagoras, king of Cyprus, against the Persians. In 378, when Athens entered into an alliance with Thebes against Sparta, he defeated Agesilaus near Thebes. On this occasion he invented a manœuvre, which consisted in receiving a charge on the left knee, with shields resting on the ground and spears pointed against the enemy. In 376 he gained a decisive victory over the Spartan fleet off Naxos, but, when he might have destroyed the Spartan fleet, remembering the fate of the generals at Arginusæ, he delayed to pick up the bodies of his dead. Later, when the Athenians changed sides and joined the Spartans, he repulsed Epaminondas before the walls of Corinth. In 366, together with Callistratus, he was accused of treachery in advising the surrender of Oropus to the Thebans. He was acquitted, and soon after he accepted a command under Tachos, king of Egypt, who had revolted against Persia. But on the outbreak of the Social War (357) he joined Chares in the command of the Athenian fleet. He lost his life in an attack on the island of Chios.

See Cornelius Nepos, Chabrius; Xenophon, Hellenica, v. 1-4; Dio, Sic. xx. 29-34; and C. Rehdeante, Viteo Hipocrates, Chabrius, et Deme, 1848 (1st ed.) art. DELIAN LEAGUE, section B, and authorities there quoted.

CHABRIER, ALEXIS EMMANUEL (1841-1894), French composer, was born at Amberg, Puy de Dôme, on the 18th of January 1841. At first he only cultivated music as an amateur, and it was not until 1870 that he threw up an administration appointment in order to devote himself entirely to the art. He had two years previously written an opéra bouffe entitled L’Étoile, which was performed at the Bouffes Parisiens. In 1881 he was appointed chorus-master of the concerts then recently established by Lamoureux. In 1883 he composed the brilliant orchestral rhapsody entitled España, the theme of which he had jotted down when travelling in Spain. His opera Guédolinde was brought out with considerable success at Brussels on the 20th of April 1886, and was given later at the Paris Grand Opéra. The following year 1887, Le Roi malgré lui, an opera of a lighter description, was produced in Paris at the Opéra Comique, its run being interrupted by the terrible fire by which this theatre was destroyed. His last opera, Briséis, was left unfinished, and performed in a fragmentary condition at the Paris Opéra, after the composer’s death in Paris on the 13th of September 1894. Chabrier was also the author of a set of preludes entitled Pièces pittoresques, Valses romantiques, for two pianos, a fantasia for horn and piano, &c. His great admiration for Wagner asserted itself in Guédolinde, a work which, in spite of inequalities due to want of experience, is animated by a high artistic idea, is poetically conceived, and shows considerable harmonic originality, besides a thorough mastery over the treatment of the orchestra. The characteristics of Le Roi malgré lui have been well summed up by M. Joncières when he alludes to “cette verve inépuisable, ces rythmes endiablés, cette exubérance de gaieté et de vigueur, à laquelle vnaient se joindre la note mélancolique et émue.” Chabrier’s premature death prevented him from giving the full measure of his worth.

CHACMA, the Hottentot name of the Cape baboon, Papio porcarius, a species inhabiting the mountains of South Africa as far north as the Zambezi. Of the approximate size of an English mastiff, this powerful baboon is blackish grey in colour with a tinge of green due to the yellow rings on most of the hairs. Unlike most of its tribe, it is a good climber; and where wooded cliffs are not available, will take up its quarters in tall trees. Chacmas frequently strip orchards and fruit-gardens, break and devour ostrich eggs, and kill lambs and kids for the sake of the milk in their stomachs.

CHACO, a territory of northern Argentina, part of a large district known as the Gran Chaco, bounded N. by the territory of Formosa, E. by Paraguay and Corrientes, S. by Santa Fé, and W. by Santiago del Estero and Salta. The Bermejo river forms its northern boundary, and the Paraguay and Paraná rivers its eastern; these rivers are its only means of communication. Pop. (1865) 10,422; (1904, est.) 13,937; area, 52,741 sq. m. The northern part consists of a vast plain filled with numberless lagoons; the southern is bordered on the east by a range of dense forests, occasionally broken by open grassy spaces. Its forests contain many species of trees of great economic value; among them is the querebro, which is exported for the tannin which it contains. The capital, Resistencia, with an estimated population of 3,500 in 1904, is situated on the Paraná river opposite the city of Corrientes. There is railway communication between Santa Fé and La Sabana, an insignificant timber-cutting village on the southern frontier. In the territory there are still several tribes of uncivilized Indians, who occasionally raid the neighbouring settlements of Santa Fé.

CHACONNE (Span. chacona), a slow dance, introduced into Spain by the Moors, now obsolete. It resembles the Passacaglia. The word is used also of the music composed for this dance—a slow stately movement in ¾ time. Such a movement was often introduced into a sonata, and formed the conventional finale to an opera or ballet until the time of Gluck.

CHAD (CRADDA), SAINT (d. 679), brother of Cedd, whom he succeeded as abbot at Lastingham, was consecrated bishop of the Northumbrians by Wine, the West Saxon bishop, at the region of Osvald in 664. On the return of Wilfrid from France, where he had been held to be condemned on the same see, a dispute of course arose, which was settled by Theodore in favour of Wilfrid after three years had passed. Chad thereupon retired to Lastingham, whence with the permission of Osvald he was summoned by Wulfhere of Mercia to succeed his bishop Jaruman, who died 667. Chad built a monastery at Barrow in Lincolnshire and fixed his see at Lichfield. He died after he had held his bishopric in Mercia two and a half years, and was succeeded by Wynfrith. Bede gives a beautiful character of Chad.

CHAD, a lake of northern Central Africa lying between 12° 30' and 14° 10' N. and 13° and 15° E. The lake is situated about 850 ft. above the sea in the borderland between the fertile and wooded regions of the Sudan on the south and the arid steppes which merge into the Sahara on the north. The area of the lake is shrinking owing to the progressive desiccation of the country, Saharan climate and conditions replacing those of the Sudan. The drying-up process has been comparatively rapid since the middle of the 19th century, a town which in 1850 was on the southern margin of the lake being in 1905 over 20 m. from it. On the west the shore is perfectly flat, so that a slight rise in the water causes the inundation of a considerable area—a fact not without its influence on the estimates made at varying periods as to the size of the lake. Around the north-west and north shores is a continuous chain of gently sloping sand-hills covered with bush. This region abounds in big game and birds.
are plentiful. In the east, the country of Kanem, the desiccation has been most marked. Along this coast is a continuous chain of islands running from north-west to south-east. But what were islands when viewed by Overweg in 1851, formed in 1903 part of the mainland and new islands had arisen in the lake. They are generally low, being composed of sand and clay, and lie from 5 to 20 m. from the shore, which throughout its eastern side nowhere faces open water. The channels between the islands do not exceed 2 m. in width. Two principal groups are distinguished, the Kuri archipelago in the south, and the Buduma in the north. The inhabitants of the last-named islands were noted pirates until reduced to order by the French. The coastline is, in general, undefined and marshy, and broken into numerous bays and peninsulas. It is also, especially on the east, lined by lagoons which communicate with the lake by intricate channels. The lake is nowhere of great depth, and about midway numerous mud-banks, marshes, islands and dense growths of aquatic plants stretch across its surface. Another stretch of marsh usually cuts off the northernmost part of the lake from

the central sections. The open water varies in depth from 3 ft. in the north-west to over 20 in the south, where desiccation is less apparent. Fed by the Shari (q.v.) and other rivers, the lake has no outlet and its area varies according to the season. The flood water brought down by the Shari in December and January causes the lake to rise to a maximum of 24 ft., the water spreading over low-lying ground, left dry again in May or June. But after several seasons of heavy rainfall the waters have remained for years beyond their low-water level. Nevertheless the secular shrinking goes on, the loss by evaporation and percolation exceeding the amount of water received; whilst, on the average, the rainfall is diminishing. In 1870 the lake rose to an exceptional height, but since then, save in 1897, there has been only the normal seasonal rise. The prevalent north-east wind causes at times a heavy swell on the lake. Fish abound in its waters, which are sweet, save at low-level, when they become brackish. The lagoons are believed to act as purifying pans in which the greater part of the salt in the water is precipitated. In the south-west end of the lake the water is yellow, caused by banks of clay; elsewhere it is clear.

The southern basin of Chad is described under the Shari, which empties its waters into the lake about the middle of the southern shore, forming a delta of considerable extent. Beyond the south-east corner of the lake is a depression known as the Bahr-el-Ghazal (not to be confounded with the Nile affluent of the same name). This depression is the termination of what is in all probability the bed of one of the dried-up Saharan rivers. Coming from the Tibesti highlands the Bahr-el-Ghazal has a south-westerly trend to Lake Chad. Near the lake the valley was formerly swampy, and at high-water the lake overflowed into it. There was also at one time communication between the Shari and the Bahr-el-Ghazal, so that the water of the first-named stream reached Chad by way of the Bahr-el-Ghazal. There is now neither inlet nor outlet to the lake in this direction, the mouth of the Ghazal having become a fertile millet field. There is still, however, a distinct current from the Shari delta to the east end of the lake—known to the natives, like the depression beyond, as the Bahr-el-Ghazal—indicative of the former overflow outlet.

Besides the Shari, the only important stream entering Lake Chad is the Waube or Yo (otherwise the Komadugu Yobe), which rises near Kano, and flowing eastward enters the lake on its western side about 40 m. north of Kuka. In the rains the Waube carries down a considerable body of water to the lake.

Lake Chad is supposed to have been known by report to Ptolomy, and is identified by some writers with the Kura lake of the middle ages. It was first seen by white men in 1823 when it was reached by way of Tripoli by the British expedition under Dr Walter Oudney, R.N., the other members being Captain Hugh Clapperton and Major (afterwards Lieut.-Colonel) Dixon Denham. By them the lake was named Waterloo. In 1850 James Richardson, accompanied by Heinrich Barth and Adolf Overweg, reached the lake, also via Tripoli, and Overweg was the first European to navigate its waters (1851). The lake was visited by Eduard Vogel (1855) and by Gustav Nachtigal (1879), the last-named investigating its hydrography in some detail. In 1890-1893 its shores were divided by treaty between Great Britain, France and Germany. The first of these nations to make good its footing in the region was France. A small steamer, brought from the Congo by Emile Gentil, was in 1897 launched on the Shari, and reaching the Chad, navigated the southern part of the lake. Communication between Algeria and Lake Chad by way of the Sahara was opened, after repeated failures, by the French explorer F. Foureau in 1890-1900. At the same time a French officer, Lieut. Joalland, reached the lake from the middle Niger, continuing his journey round the north end to Kanem. A British force under Colonel T. L. N. Morland visited the lake at the beginning of 1902, and in May of the same year the Germans first reached it from Cameroon. In 1902-1903 French officers under Colonel Destanove made detailed surveys of the south-eastern and eastern shores and the adjacent islands. In 1903 Captain E. Lenfant, also a French officer, succeeded in reaching the lake (which he circumnavigated) via the Benue, proving the existence of water communication between the Shari and the Niger. In 1905 Lieut. Boyd Alexander, a British officer, further explored the lake, which then contained few stretches of open water. The lake is bordered W. and S.W. by Bornu, which is partly in the British protectorate of Nigeria and partly in the German protectorate of Cameroon. Bagirmi to the S.E. of the lake and Kanem to the N.E. are both French possessions. The north and north-west shores also belong to France. One of the ancient trade routes across the Sahara—that from Tripoli to Kuka in Bornu—strikes the lake at its north-west corner, but this has lost much of its former importance.

CHADERTON, an urban district of Lancashire, England, within the parliamentary borough of Oldham (q.v.), Pop. (1901) 24,892. Cotton and chemical works, and the coal-mines of the neighbourhood, employ the large industrial population.

CHADERTON, LAURENCE (17336-1940), Puritan divine, was born at Lees Hall, in the parish of Oldham, Lancashire, probably in September 1536, being the second son of Edmund Chaderton,
a gentleman of an ancient and wealthy family, and a zealous Catholic. Under the tuition of Laurence Vaux, a priest, he became an able scholar. In 1564 he entered Christ's College, Cambridge, where, after a short time, he formally adopted the reformed doctrines and was in consequence disinherited by his father. In 1567 he was elected a fellow of his college, and subsequently was chosen lecturer of St Clement's church, Cambridge, where he preached to admiring audiences for many years. He was a man of moderate views, though numbering among his friends extremists like Cartwright and Perkins. So great was his reputation that when Sir Walter Mildmay founded Emmanuel College in 1584 he chose Chaderton for the first master, and on his expressing some reluctance, declared that if he would not accept the office the foundation should not go on. In 1604 Chaderton was appointed one of the four divines for managing the cause of the Puritans at the Hampton Court conference; and he was also one of the translators of the Bible. In 1587 he had taken the degree of B.D., and in 1613 he was created D.D. At this period he made provision for twelve fellows and above forty scholars in Emmanuel College. Fearing that he might have a successor who held Arminian doctrines, he resigned the mastership in favour of John Preston, but survived him, and lived also to see the college presided over successively by his own son (Rt. Rev. Dr. Richard Herring). He died on the 17th of November 1640 at the age of about 93, preserving his bodily and mental faculties to the end.

Chaderton published a sermon preached at St Paul's Cross about 1530, and a treatise on "On Justification" was printed by Anthony Thysius, professor of divinity at Leiden. Some other works by him on theological subjects remain in manuscript.

**CHADWICK, SIR EDWIN** (1800-1890). English sanitary reformer, was born at Longsight, near Manchester, on the 24th of January 1800. Called to the bar without any independent means, he sought to support himself by literary work, and his essays in the Westminster Review (mainly on different methods of applying scientific knowledge to the business of government) introduced him to the notice of Jeremy Bentham, who engaged him as a literary assistant and left him a handsome legacy. In 1832 he was employed by the royal commission appointed to inquire into the operation of the poor laws, and in 1833 he was made a full member of that body. In conjunction with Nassau W. Senior he drafted the celebrated report of 1834 which produced the reform of the old poor law. His special contribution was the institution of "registration" as the basis of administration. He failed, however, in a much more centralized system of administration than was adopted, and he never ceased to complain that the reform of 1834 was fatally marred by the rejection of his views, which contemplated the management of poor-law relief by salaried officers controlled from a central board, the boards of guardians acting merely as inspectors. In 1834 he was appointed secretary to the poor law commissioners. Finding himself unable to administer in accordance with his own views an act of which he was largely the author, his relations with his official chiefs became much strained, and the disagreement led, among other causes, to the dissolution of the poor law commission in 1846. Chadwick's chief contribution to political controversy was his constant advocacy of entrusting certain departments of local affairs to trained and selected experts, instead of to representatives elected on the principle of local self-government. While still officially connected with the poor law he had taken up the question of sanitation in conjunction with Dr Southwood Smith, and their joint labours produced a most satisfactory report in the public health. His report on "The Sanitary Condition of the Labouring Population" (1842) is a valuable historical document. He was a commissioner of the Board of Health from its establishment in 1848 to its abolition in 1854, when he retired upon a pension, and occupied the remainder of his life in voluntary contributions to sanitary and economical questions. He died at East Sheen, Surrey, on the 6th of July 1890. He had been made K.C.B. in 1889.

Edwin Chadwick (1885); also _The Health of Nations, a Review of the Works of Edwin Chadwick, with a Biographical Introduction_, by Sir B. W. Richardson (1887).

**CHAEREMON**, Athenian dramatist of the first half of the 4th century B.C. He is generally considered a tragic poet. Aristotle (Rhetoric, iii. 12) says his works were intended for reading, not for representation. According to Suidas, he was also a comic poet, and the title of at least one of his plays (Achilles Slayer of Thersites) seems to indicate that it was a satyr drama. His _Centaurus_ is described by Aristotle (Poet. i. 12) as a rhapsody in all kinds of metres. The fragments of Chaeremon are distinguished by correctness of form and facility of rhythm, but marred by a florid and affected style reminiscent of Agathon. He especially excelled in descriptions (irrelevantly introduced) dealing with such subjects as flowers and female beauty. It is not agreed whether he is the author of three epigrams in the Greek Anthology (Palatine vii. 460, 720, 721) which bear his name.

See H. Bartsch, _De Chaeremoni Poëta tragico_ (1843); fragments in A. Nauck, _Fragmenta Tragicorum Graecorum_.

**CHAERONEA**, or CHAERONEA, an ancient town of Boeotia, said by some to be the Homer Arne, seated about 7 m. W. of Orchomenus. Until the 14th century B.C. it was a dependency of Orchomenus, and at all times it played but a subordinate part in Boeotian politics. Its importance lay in its strategic position near the head of the defile which presents the last serious obstacle to an invader in central Greece. Two great battles were fought on this site in antiquity. In 338 B.C. Philip II. and Alexander of Macedon were confronted by a confederate host from central Greece and Peloponnesse under the leadership of Thebes and Athens, which here made the last stand on behalf of Greek liberty. A hard-fought conflict, in which the Greek infantry displayed admirable firmness, was decided in favour of Philip through the superior organization of his army. In 86 B.C. the Roman general L. Cornelius Sulla defeated the army of Mithradates VI., king of Pontus, near Chaeronea. The latter's enormous numerical superiority was neutralized by Sulla's judicious choice of ground and the steadiness of his legionaries; the Asiatists after the failure of their attack were worn down and almost annihilated. Chaeronea is also notable as the birthplace of Plutarch, who returned to his native town in old age, and of held in honour by its citizens for many successive generations. Pausanias (ix. 40) mentions the divine honours accorded at Chaeronea to the sceptre of Agamemnon, the work of Hephaestus (cf. _Iliad_, ii. 101). The site of the town is partly occupied by the village of Kapaena; the ancient citadel was known as the Petrichus, and there is a theatre cut in the rock. A colossal seated lion a little to the S.E. of the site marks the grave of the Boeotians who fell fighting against Philip; this lion was found broken to pieces; the tradition that it was blown up by Odysseus Androutos is incorrect (see Murray, _Handbook for Greece_, ed. 5, 1884, p. 406). It has now been restored and re-erected (1905).
CHAETOGLANATHA—CHAETOPODA

CHAETOGLANATHA, the name given by R. Leuckhart to a small group of transparent and for the most part pelagic organisms, whose position in the animal kingdom is a very isolated one. Only three genera, Sagitta, Spadella and Krohnia, are recognised, and the number of species is small.

Nevertheless these animals exist in extraordinary quantities, so that at certain seasons and under certain conditions the surface of the sea is often most strikingly pervaded by these minute organisms which serve it. Rough seas, &c., cause them to seek safety in dropping into deeper water. Deep-sea forms also occur, but in spite of this the group is essentially pelagic.

As a rule the body is some 1 to 2 or 3 cm. in length, though some species are larger, by 4 or 5 mm. in breadth, and it is shapen something like a torpedo with side flanges on or a slightly rounded head forms, and the middle part. These forms can be divided into three regions—(i) head, (ii) trunk, and (iii) tail, separated from another by two transverse septa. The anterior spheral cerebral head is covered by a hood which can be retracted; it bears upon its side a number of sickle-shaped, chitinous hooks and one or more short rows of low spines. Both these features are used to some extent in the olfactory function has been attributed. The interior of the head is filled up with masses of muscle fibres which are mainly occupied with moving the sickle-shaped hooks. The trunk contains a spacious body-cavity filled during the breeding season by the swollen oocytes, and the same is true of the tail if there are eggs for oviposition.

The skin consists of a transparent cuticle excreted by the underlying ectoderm, the cells of which usually one-layered may be formed into several layers in the head; beneath this is a basement membrane, and then a layer of longitudinal muscle fibres which are limited inside by a layer of peritoneal cells. The trunk is striated and arranged in four quadrants, two dorso-lateral and two ventro-lateral, and arrangement which recall those of the Nemata, whilst in their histology somewhat resemble the muscles of the Oligochaeta. Along each side of the body pass the ducts of the fin and a small flange surrounds the tail. Into these fins, which are largely cuticular and strengthened by radiating bars, a single layer of ectoderm cells project.

The mouth, a longitudinal slit, opens on to the ventral surface of the head. It leads into a straight alimentary canal whose walls consist of a layer of ciliated cells embedded in a third layer of peritoneal cells. There is no armature, and no glands, and the whole tract can only be divided into an esophagus and a pharynx. The esophagus is slightly twisted or coils straight to the anus, which is situated at the junction of the trunk with the tail. A median mesentery running dorso-laterally carries lateral alimentary forms is continued behind it to the tail, thus dividing the body cavity into two lateral halves.

There are no specialized circulatory, respiratory or excretory organs.

The nervous system consists of a cerebral ganglion in the head, a conspicuous ventral ganglion in the trunk, and of lateral commissures uniting these ganglia on each side. The whole of this system has retained its primitive connexion with the ectoderm. The cerebral ganglion also gives off a nerve on each side to a pair of the segmental organs, which are described as closed, their outer ends opening on one each side of the anus, where the trunk joins the tail. According to Miss M. Stevens the so-called ovicyst acts only as a sperm-duct or receptaculum seminis. The spermatozoa enter it as a minute duct formed of two accessory cells, and finally enter the rip ovum. Temporary oviducts are formed between the sperm duct and the gonadal epithelium at each oviposition. A number ofova then pass simultaneously into the two lateral peritoneal cells, and are formed by lateral proliferations of the lining peritoneal cells. These break off and, lying in the coelomic fluid, break up into spermatozoa. They pass out through short vasa deferentia with internal ciliated funnels, sometimes an enlargement on their course—the seminal vesicles—and a minute external pore situated on the side of the tail.

With hardly an exception the transparent eggs are laid into the sea and float on its surface. The development is direct and there is no larva stage. The segmentation is incomplete. The egg shell, an empty bladder invaginates and forms a gastrol. The blastopore closes, a new mouth and a new anus subsequently arising. The archenteron opens off two lateral pouches and thus becomes continuous with the body-lobe forms the alimentary canal; it closes behind and opens to the exterior anteriorly and so makes the mouth. The two lateral lobes contain the coelom; each separate off in front a segment which forms the head and presumably then divides again laterally and anteriorly, to make the body. An interesting feature of the development of Chaetognaths is that, as in some insects, the cells destined to form the reproductive organs are differentiated at a very early period, being apparent even in the gastrula.

The great bulk of the group is pelagic, as the transparent nature of all their tissues indicates. They move by flexing their bodies. Spadella aphroditae is, however, lies and oviposits on sea-weed, and the "Valdivia" brought home a deep-sea species.

The three genera are differentiated as follows:—

Sagitta M. Slabber, with two pairs of lateral fins. This genus was named Cornylos as 1775.

Krohnia P. Langenhaan, with one lateral fin on each side, extending on to the tail.

Spadella P. Langenhaan, with a pair of lateral fins on the tail and a thicken tergociliary edge running back on each side from the base to the anterior end of the fin.

The group is an isolated one and should probably be regarded as a separate phylum. It has certain histological resemblances with the Oligochaeta and certain points of structure to the Nematoda, whilst in the surface of body, the skin and excretory system are in a state of transition between the Rhizopoda and the Echinodermata. It is probably nearest to the Echinodermata, and its relationship to the Chondrichthyes is also probable.
CHAETOPODA

where this condition is usually not to be observed, there is embryological evidence that the existing state of affairs is derived from this. Commonly the nephridia are strictly paired a single pair to each segment, while the branches of the blood vascular system are similarly meramic. The alimentary canal is nearly always a straight tube running from the mouth, which is surrounded by the first segment of the body and overarching by the prosthomium, to the anus, which is then either surrounded by the last segment of the body or opens dorsally a little way in front of this.

The Class as a Whole.—The Chaetopoda are with but few exceptions (Myzostomida in part, Sertumnida) elongated worms, flattened or, more usually, cylindrical, and bilaterally symmetrical. The body consists of a number of exactly similar or closely similar segments, which are never fused and metamorphosed, as in the Arthropoda, to form specialized regions of the body. It is, however, always possible to recognize a head, which consists at least of the peristomial segment with a forward projection of the same, the prosthomium. A thorax also is sometimes to be distinguished from an abdomen. Where locomotive appendages (the parapodia of the Polychaeta) exist, they are never jointed, as in the Arthropoda; nor are they modified anteriorly to form jaws, as in that group.

The prosthomium overhangs the mouth, and is of considerable size and, as a rule, quite distinct from the segment following, being certain Polychaeta the bundles of setae are so extensive that they nearly form a complete circle surrounding the body; and in the Oligochaet genus Perichaeta (=Pheretima), and some allies, there is actually a complete circle of setae in each segment broken only by muscular, thin-veined, or one dorsal bundle of setae.

Coelom.—The Chaetopoda are characterized by a spacious coelom, which is divided into a series of chambers in accordance with the general metamericity of the body. This is the typical arrangement, while in others it is quite different. The majority of the Chaetopoda is ciliated, The walls of the coelom, formed by the lining of the various segments, are left without any evidence of a cuticle; in these the successive chambers of the coelom are separated by the intersegmental septa, sheets of muscle fibres extending from the body wall to the gut and thus forming partitions across the body. The cerebral coelom gives rise to the cavities of the brain, while the pericardial coelom is armed with one setal cavity. The cerebral coelom consists of a definite number of cavities, which are never confused with the cerebral, the pericardial, or the ventral coelom. There are several forms of cells float freely in the fluid of the coelom. In another sense also the coelom is not a closed cavity, for it communicates in several ways with the external medium. Thus, among the Oligochaeta there are often a series of dorsal pores, or a single head pore, present also among the Polychaeta (in Ammochares). In these and other Chaetopoda the coelom is also put into indirect relations with the outside world by the nephridia and by the gonads. The nephridia, which are as a rule regarded as structures derived from the pericardial coelom, are frequently reduced in many groups of the Oligochaeta and Nematoda, where the pericardial cavity is, at least, partially, the vascular or haemal system, and agrees with the Vertebrata. The coelom is lined throughout by cells, which upon the intestine become large and loaded with excretory granules, and are known as chromogen cells. Several forms of cells float freely in the fluid of the coelom.

Among the simpler Chaetopoda the coelom retains the character of a series of paired chambers, showing the same relations to the exterior and to the gonads. There are, however, further complications in some forms. Especially these are to be seen in the more modified Oligochaeta and in the much more modified Hirudinea. In the Polychaeta, which are to be regarded as simpler forms than the Oligochaeta and Nematoda, the pericardial coelom is divided into a series of cavities, each possibly corresponding to an area of the cerebral ganglion, and the pericardial coelom is never confused with the cerebral coelom. In the Hirudinea the cerebral coelom is divided into a series of cavities, and the pericardial coelom is divided into a series of cavities, each corresponding to a ganglion of the cerebral system, each chamber being connected by a circumsophageal commissure with the ventral ganglionated cord. The plan of the central nervous system is therefore that of the Arthropoda. Among the Annelida, however, there is a tendency for separation of the cerebral coelom from the pericardial; and the pericardial coelom remains imbedded in the epidermis. In others, it lies in the coelom, often surrounded by a special and occasionally rather thick sheath. The cerebral ganglia constitute an archicerebrum for the most part, there being no evidence that, as in the Arthropoda, a movement forward of post-oral ganglia has taken place. In the leeches, however, there seems to be the commencement of the formation of a syncretic nervous system, the ganglia arranged in series. In the latter, the segmentally arranged ganglia are more reduced off from the connections than in other Chaetopoda, where nerve cells exist along the whole ventral chain, though more numerous in segmentally disposed swellings.

Vascular System.—In addition to the coelom, another system of vessels, running along the pericardial coelom, secretes the gut in the Chaetopoda. This is the vascular or haemal system (formerly and unnecessarily termed pseudhaemal). With a few exceptions among the Polychaeta and the Oligochaeta, the system is always present among the Hirudinea, and is usually a mere short series of vessels forming a soft ring around the coelom, which rarely communicate with the coelom. It is in fact typically a closed system. The larger trunks open into each other either directly by cross branches, or a capillary system is formed. The capillary system is lacunary, that is, the cells lack walls, except for a sinus surrounding the intestine, which is at least frequently present. The principal trunks consist of a dorsal vessel lying above the gut, and a ventral vessel below the gut but above the mantle. These vessels continue into a capillary system in the anterior region of the body by a smaller or greater number of branches which surround the osophagus and are, some of them, at least, contractile and in that case wider than the rest. The dorsal vessel is connected with the intestinal sinus, which gives off branches to both the longitudinal trunks, and by segmentary vessels and capillaries which supply the skin and the nephridia. In the smaller and simpler forms the vessels and networks are much reduced, but the dorsal and ventral vessels are usually present. The former, however, is frequently

**Fig. 1.**—A, side view of the head region of *Nereis culteria;* B, dorsal view of the same.

separated by an external groove, and containing, at least temporarily, the brain, which always arises there. Its cavity is also at first independent of the coelom though later invaded by the latter. In any case the cavity of the prosthomium is single, and not formed, as is the cavity of the segments of the body, by paired coelomic chambers. It has, however, been alleged that this cavity is formed by a pair of mesoblastic somites (N. Kleinberg), in which case the reason for favouring the view that would assign an equality between the prosthomium and the (in that case) other segments of the body. The peculiar specimens of *Tomopinax* is described below; this, which is separated from the gut by the coelom and its peritoneal walls, except in most leeches. A single layer of epithelial cells, some of which are glandular, forms the outer layer. Rarely are these ciliated, and then only in limited tracts. They secrete a cuticle which never appears in thickness the often calculated absolute division of the Arthropoda. Below this is a circular, and below that a longitudinal, layer of muscle fibres. These muscles are not striated, as they are in the Arthropoda.

Setae.—These chitinous, rod-like, rarely squat and then hook-like structures are found in the majority of the Chaetopoda, being absent only in certain Archinannelida, most leeches, and a very few Oligochaeta. They exist in the Brachiopoda (which are probably not unrelated to the Chaetopoda), but otherwise perhaps exclusively in the Arthropoda. The setae are organs of locomotion, though their large size and occasionally jagged edges in some of the Polychaeta suggest an aggressive function. They are disposed in two groups on either side, corresponding in the Polychaeta to the parapodia; the two bundles are commonly reduced among the Poly-chaeta to two pairs of setae even to a single seta. On the other hand, in
developed only in the anterior region of the body where it emerges from the peri-intestinal blood sinuses. On the other hand, additional longitudinal trunks are sometimes developed, the chief one of which is a supra-intestinal vessel lying below the dorsal vessel and closely adherent to it. The main trunks of the vascular system often possess valves at their origin in the oesophagus which regulate the direction of the blood flow. Among many Oligochaeta the dorsal blood-vessel is partly or entirely a double tube, which is a retention of a character shown by F. Vezhdovksy to exist in the embryo of certain forms. The blood in the Chaetopoda consists of two portions, one of which contains the oxygenated blood, red by haemoglobin: it is sometimes (in *Subella* and a few other Oligochaeta) green, which tint is due to another respiratory pigment. The plasma may be pink (Magentina) or yellow (Aphrodite) in which case it is generally owing to another pigment, Vezhdovksy (1870) has shown that there is no functional connection between the haemal system and the lymphatic vessels. Finally, there are certain Polychaeta, *e.g.* the Capitellidae, in which the vascular system has vanished altogether, leaving a ciliated haemoglobin-containing corpuscles. It has been suggested (E. Ray Lankester) that this condition has been arrived at through some such intermediate stage as that offered by Polychaeta Magelona. In this worm the ventral blood-vessel is so swollen as to occupy nearly the whole of the available coelom. Carry the process a little farther and the coelom disappears and its place is taken by a blood space or haemocoele. It has been held that the condition shown in certain leeches tend to prove that the coelom and haemocoeel are primitively one series of spaces which have afterwards been gradually differentiated. The facts of development however, prove their distinctness, though those same facts do not speak clearly as to the true nature of the blood system. One view of the origin of the latter (largely based upon observations upon the development of *Polygordus*) sees the blood system as a persistent blastocoeel. F. Vezhdovksy has lately seen reasons for regarding the blood system as originating entirely from the hypoblast by the secretion of fluid, the blood, from particular intestinal cells and the consequent formation of spaces through pressure, which become lined with these cells.

**Nephridia and Coelomoducts.**—The name “Nephridium” was originally given by Sir E. Ray Lankester to the members of a series of hypodermal excretory organs which exist typically to the number of a single pair in most of the segments of the Chaetopod body, and open each by a ciliated orifice into the coelom on the one hand, and by a pore on the exterior of the body on the other. As a whole this view was held as homologous organs (so far as the present group is concerned) not only the nephridia of Oligochaeta and Hirudinea, which are obviously closely similar, but the wide tubes with an intercelular lumen and large albuminod tissue is the rule. As in the position is taken up by Wilson, who the gonad ducts in Oligochaeta and Hirudinea. The function of the convoluted excretion was not therefore a necessary part of the view—though it may be pointed out that there are grounds for believing that in the gonad ducts are to some extent abortive organs of excretion (see below). Later, the investigations of E. Meyer and E. S. Goodrich, endorsed by Lankester, led to the opinion that under the general morphological conception of “nephridium” were included two distinct sets of organs, viz. nephridia and coelomoducts. The original description of the segments (organ of *Lumbricus*) have been asserted to be “ultimately, though not always, actually traceable to the ectoderm” the latter (represented by, *e.g.* the oviduct of *Lumbricus*) are organs of the coelomic wall. The fact that the condition is limited to the nephridia, but not to the coelomic wall, is that on this view, are eterodermic ingrowths, the coelomoducts coelomic outgrowths. The cavity of the former has nothing to do with coelom. The cavity of the latter is coelomic.
CHAETOPODA

Amphioxus. More usually, and in nearly every other case among the Oligochaeta and Hirudinea, the coelomic aperture of the nephridium consists of several cells, ciliated like the nephridium itself for a greater or lesser extent, and the funnel grows greatly in size and number of its component cells. There are so many differences of detail that no line can be drawn between the one-celled funnel of Aeolosoma and the extraordinarily large and folded funnel of the postulated oocoeosomes of Oligochaeta. In the Poly-chaeta, however, there is another form of nephridium seen, for example, in Arenicola, where a large funnel leads into a short and wide excretory tube whose lumen is intercellular. In the young stages of this worm which have been investigated the tube is without a funnel but little pronounced funnel, has still an intercellular duct. This organ in Polychaeta serve for the removal of the generative products to the exterior; it is proved not only by the correspondence in nematode and leeches of the gonad and the nephridial segment, but by the disappearance in nematode of the nephridial and generative products in transit. This form of nephridium leads to the shorter but essentially similar organs in the Polychaeta Sterneis, and to those of the Echiuroidea (g.v.) and of the Gephyrea (g.v.).

Though the paired arrangement of the nephridium is the prevalent one among the Oligochaeta and Hirudinea, it is also found in the Polychaeta, of species and genera in which there are several, many, nephridia in each segment of the body, which may or may not be connected among themselves, but have in any case separate orifices on the exterior.

2. Coelomodisci.—In this category are included (by Goodrich and Lankester) the gonad ducts of the Oligochaeta, certain funnels without any aperture to the exterior that have been detected in Nereis, and which are also wide and are apparently more or less parallel in other Polychaeta, however. It is with another form of nephridium seen, for example, in Arenicola, where a large funnel leads into a short and wide excretory tube whose lumen is intercellular. In the young stages of this worm which have been investigated the tube is without a funnel but little pronounced funnel, has still an intercellular duct. That these organs in Polychaeta serve for the removal of the generative products to the exterior is proved not only by the correspondence in nematode and leeches of the gonad and the nephridial segment, but by the disappearance in nematode of the nephridial and generative products in transit. This form of nephridium leads to the shorter but essentially similar organs in the Polychaeta Sterneis, and to those of the Echiuroidea (g.v.) and of the Gephyrea (g.v.).

Though the paired arrangement of the nephridium is the prevalent one among the Oligochaeta and Hirudinea, it is also found in the Polychaeta, of species and genera in which there are several, many, nephridia in each segment of the body, which may or may not be connected among themselves, but have in any case separate orifices on the exterior.

Notwithstanding the great deal of difference between most of these structures and those of the true coelomodisci, for example Parancylis, as a category it is necessary to refer the excretory organs of Arenicola, or Polyne, both series of organs consist essentially of a ciliated tube leading from the coelom to the exterior. Both series of organs grow back centrifugally from the funnel. In both the cavity originally appears, with the growth of the coelom an intercellular coelom and grows backwards. In some cases, e.g. oviducts of Oligochaeta, sperm ducts of Pharyx, the coelomodisci occupy, like the nephridium, two segments, the funnel opening into the funnels of the other. These characters are plain in all the cases cited, excepting only the leeches which will be considered separately.

There is not a great deal of difference between most of these structures and those of the true coelomodisci, for example Parancylis, as a category it is necessary to refer the excretory organs of Arenicola, or Polyne, both series of organs consist essentially of a ciliated tube leading from the coelom to the exterior. Both series of organs grow back centrifugally from the funnel. In both the cavity originally appears, with the growth of the coelom an intercellular coelom and grows backwards. In some cases, e.g. oviducts of Oligochaeta, sperm ducts of Pharyx, the coelomodisci occupy, like the nephridium, two segments, the funnel opening into the funnels of the other. These characters are plain in all the cases cited, excepting only the leeches which will be considered separately.

The gonad ducts of Lumbicrus, &c., must perform one function of nephridia; they must convey to the exterior some of the ciliated fluid with its disintegrated products of waste. There is no possibility that sperm and ova can escape by these tubes not in company with ciliated tubes. In the case of many Oligochaeta there is no need for a coelomodiscus. This is the only function, the function must be the chief of these, the more elaborate process of excretion taking place in the case of nephridia surrounded by a rich plexus of blood capillaries. A consideration of the mode of development and appearance of the coelomodisci that have thus far been discussed (in the leeches and Polychaeta) seems to show that there is a distinct though varying relation between them and the nephridia. It has been shown that in Tubex, and some other aquatic Oligochaeta, the genital segments are at first provided with a coelomodiscus, and that this is replaced by the generative ducts, which are coelomodisci. In Lumbicrus the connexion is a little closer; the funnel of the nephridium, in which the segments in which the funnels of the gonad ducts are to be developed, are at first connected with the coelomodiscus. Again, it is interesting to observe that the genital funnels are developed precisely where the nephridial funnels formerly existed. If the genital funnels are not wholly or partly formed out of the nephridial funnels they have replaced them. In the genital segments of Eudilia the nephridia are present, but the nephridial funnels have not been formed out of the nephridial segments. Here also the genital funnels have either replaced or been formed out of nephridial funnels. In Habrotatia heterogne (W. B. Benham) the sperm ducts are hardly to be distinguished from nephridia; they are sinus tubes with an in-cellular duct. But the funnel is large and thus differs from the funnels of the nephridia in adjoining segments. Here again the nephridial funnel seems to have been converted into or certainly replaced by a secondary gonad duct. This example is similar to cases in the Poly- chaeta where a true nephridium is provided with a large funnel, the coelomodiscus, according to the nomenclature of Lankester. The whole organ, having, as is thought but not known, this double origin, is termed a neophridium. The various facts, however, are not so susceptible of another interpretation. It may be pointed out that the several examples described recall a phenomenon which is not uncommon and is well known to anatomists. That is the replacement of certain ducts by a conversion of the funnels, such as the nephridial segment of Tubex, by a subsequently formed genitalic duct, may be compared with the succession of the esonephros to the pronephros in vertebrates, and of the metanephros to the mesonephros in the higher vertebrates. It may be well to term these structures, mostly serving on the elongated portions, e.g. the esonephros, pronephros, mesonephros, and possibly the gonad ducts in the Hirudinea. As an example of the formation it has been shown (Beddard) that a large median sac in Lyobdias is at first freely open to the coelom, that it later becomes shut off from the same, that it then acquires an external orifice and, finally, that it encloses the ovary or ovaries, between which and the exterior a passage is thus effectuated. To this category belong the oviducts in Teleostean fishes and probably the gonad ducts in several groups of invertebrates.

Polychaeta.—This group may be thus defined and the different coelomodisci compared with those of the other divisions of the Chaetopoda. Setae always present and often very large, much varied in form and very numerous, borne by the dorsal and ventral parapodia (when present). The proctum and the segments generally often bear processes sensory and branchial. Eyes often present and comparatively complex in structure. Cillium notellum as a definite organ, as in Oligochaeta. The anus is mostly terminal, and there are no anterior and posterior suckers. Nervous system often imbedded in the epidermis. Vascular system generally present forming a closed system of tubes. Nutriment rarely coiled, occasionally with glands which are simple caeca and sometimes serve as air reservoirs; jaws often present and an extensible pharynx. Nephridia sometimes of the type of those of the Oligochaeta; in other cases small, wide tubes with a large funnel serving also entirely or in part as gonad ducts. Frequently reduced in number of pairs; rarely (Capitellidae) more than one pair per segment. Gonads not restricted in position as in Oligochaeta, and often more abundant; the individuals usually unisexual. No specialized system of spermatothecae, sperm reservoirs, and copulatory apparatus, as in Oligochaeta; development generally through a larval form; reproduction by budding also occurs. Marine (rarely fresh-water) in habit.

The Polychaeta contrast with the Oligochaeta by the great variety of the structures, from a fully-formed reproductive segment to almost complete specialization of different regions of the body. The head is always recognizable and much more conspicuous than in other Chaetopoda. As in the Oligochaeta the peristomial segment is often without setae; but this character is not by any means so constant as in the Oligochaeta. The proctum bears often processes, both dorsal and ventral, which in the Sabelids are split into the circle of branchial plumes, which surround or nearly surround the mouth in those tube-dwelling Annelids. Tomopteris is remarkable for the fact that the hammer-shaped proctodaeum has paired ventral processes each with a single seta. It is held, however, that these are a pair of parapodia which have shifted forwards. The presence of parapodia distinguish this from other groups of Chaetopoda. Typically, the parapodium consists of two processes of the body on each side, each of which bears a bundle of setae; these two divisions of the "limb" are termed
respective notopodium and neuropodium. The notopodium may be rudimentary or absent and the entire parapodium reduced to the merest ridge or even completely unrepresented. Naturally, it is among the free-living genera that it has least developed, at least developed among the tubicolous Polychaeta. To each division of the parapodium belongs typically a long tentacle, the cirrus, which may be defective upon one or other of the notopodium or neuropodium, and may be developed into an arboreal or a gill into a flat scale-like process, the elytron (in Polynoe, &c). There are other gills developed in addition to those which represent the cirri.

**Seate.**—The setae of the Polychaeta are disposed in two bundles in many genera, but in only one wire, such forms as have no name the setae are

**Fig. 3.**—a, Bristle of Pionosyllis Malmgren; b, Hook of Terebellula.

Among the burrowing and tubicolous forms it is uncommon for the body to be distinguished from two or more groups, thorax, as for example, the setae are marked off from an "abdomen" in the Sabellidae. In these forms the bundles of setae are either capilliform or incisile, and the dorsal setae of the thorax are like the ventral setae of the abdomen. It is a remarkable and newly-ascertained of the Polychaeta (e.g., Syllis). In vertical rows, and in certain Capitellidae these rows so setae that the arrangement are characteristic of the continuous circle of setae in the perichaetous Oligochaeta. The setae vary much in form and are often longer and stronger than in the Oligochaeta. Jointed setae and ventral hooks of a few species (see fig. 3) are among the most remarkable forms. Simple bident setae, such as those of Oligochaeta, are also present in certain forms.

Among the burrowing and tubicolous forms it is uncommon for the body to be distinguished from two or more groups, thorax, as for example, the setae are marked off from an "abdomen" in the Sabellidae. In these forms the bundles of setae are either capilliform or incisile, and the dorsal setae of the thorax are like the ventral setae of the abdomen. The setae vary much in form and are often longer and stronger than in the Oligochaeta. Jointed setae and ventral hooks of a few species (see fig. 3) are among the most remarkable forms. Simple bident setae, such as those of Oligochaeta, are also present in certain forms.

**Nephridia.**—The nephridia of the Polychaeta have been generally dealt with above in considering the nephridial system of the Chaetodonta as a whole. They contrast with those of the Oligochaeta and Hirudinea in their frequent association with the reproductive system, the same organ sometimes serving the two functions of excretion and conveyance of the ova and spermatozoa out of the body. On the hypothesis that such a form as Dinophilus (see Haplophid) has preserved the characters of the Chaetodonta, it would be an interesting discovery to find a more nearly than any already known Polychaeta or Oligochaeta, it is clear to see that the nephridia of the Oligochaeta have preserved the original features of those organs more nearly than most Polychaeta. Thus Neris among the latter worms, from the resemblance of their excretory system bears to that of the Oligochaeta, may be made the starting-point of a series. In this worm the paired nephridia exist in most of the segments of the body, and their form (see figs. 2 & 3) is like that of the Oligochaeta. In the Enchytraeidae the nephridium is not large, appears to open, as a rule at least, into the segment in front of that which bears the external orifice. Quite independent of these there are certain large dorsally situated funnel-like folds of the coelomic epithelium, ciliated, but of which no duct has been discovered leading to the exterior. It is possible that we have here gonad ducts distinct from nephridia which at the time of sexual maturity do open on to the exterior.

**Reproduction.**—As is the case with the Oligochaeta, the Polychaeta furnish examples of species which multiply asexually by budding. There is a further resemblance between the two orders of Chaetodonta in that this budding is not a new method of modifying the new animal, but confined to a few forms only. Budding, in Chaetodonta, is limited to the family Syllidae. In the Oligochaeta it is only the families Aelosomatidae and Naididae that show the same phenomenon. It has been mentioned that in the Nereids a sexual form occurs which differs structurally from the asexual one, this sexual form is limited to a posterior region of the body which is further marked off from the anterior non-sexual segments by the oak-like setae. In some Syllids this posterior region separates in the Enchytraeidae from the rest, producing a new head; thus a process of fission occurs which has been termed schizogamy. A similar life history distinguishes certain Sabellida worms, e.g., Filograna. Among the Syllids this process of budding is further complicated. In Astolytes there is, in each form, a conversion of the posterior half of the body to form a sexual zood. Before the latter are short, a pair of posterior zooids are formed from a zone of budding which appears between the two zones of budding and in which a new head is produced. In Myriandria there is a further development of this process. The conversion of the posterior end of the simple individual into a sexual region is dispensed with, and a preanal budding series of sexual buds is produced. The buds are called Myriandria, discovered during the voyage of the "Challenger," shows a modification of this form of budding. Here, however, the buds are lateral, though produced from a budding
zone, and they themselves produce other buds, so that a ramifying colony is created.

Quite recently, another mode of budding has been described in Trypanosyllis gemmipara, where a crowd of some fifty buds arising symmetrically are produced at the tail end of the worm. In some Syllids, such as Pionosyllis gestoris, the ova are attached to the body of the parent in a regular line, and develop in situ; this process, which has been attributed to budding, is an "external gestation," and occurs in a number of species.

As is very frequently the case with marine forms, as compared with their fresh-water and terrestrial allies, the Polychaeta differ from the Oligochaeta and Hirudinea in possessing a free living larval form which is hatched at an early stage in development. This larva is termed the Trochosphere larva, and, typically (as it is held) is an egg-shaped larva with two bands of cilia, one preoral and one postoral, with an apical nervous plate surmounted by a tuft of longer cilia, and with a simple bent alimentary canal, with lateral mouth and posterior anus, between which and the ectoderm is a spacious cavity (blastocoel) traversed by muscular strands and often containing a larval kidney. The segmentation is of the mesoblast to begin with, and appears later behind the mouth, the part anterior to this becoming the prostomium of the adult. The chief modifications of this form are seen in the Mitrella larva of Ammochares with only the preoral band, which is much folded and which has provisional and long setae; the trochosphere larva, where the covering of cilia is uniform and not split into bands; and the polytrochos larva where there are several bands surrounding the body. There are also other modifications.

Classification.—The older arrangement of the Polychaeta into Errantiae or free living and Tubicolae or tube-dwelling forms will hardly fit the much increased knowledge of the group. W. B. Benham's division into Phanerocephala in which the prostomium is plain, and Cryptocephala in which the prostomium is hidden by the peristomium adopted by Sedgwick, can only be justified by the character used; for the Teredolids, though phanerocephalous, have many of the features of the Sabellids. It is perhaps safer to subdivide the Order into 6 Suborders (in the number of these following Benham, except in combining the Sabelliformia and Hermodelaria). Of these 6, the two first to be considered are very plainly separable and represent the extremes of Polychaete organization. (1) Nereidiformia.—"Errant" Polychaetes with well-marked prostomium possessing tentacles and palps with evident and locomotor parapodia, supported (with few exceptions) by strong spines, the aciculi; muscular pharynx usually armed with jaws; septa and nephridia regularly metameric and similar throughout body; free living and predaceous (2) Cryptobranchiata.—Tube-dwelling with body divided into thorax and abdomen marked by the setae, which are reversed in position in the neuropodium and notocodium respectively in the two regions. Parapodia hardly projecting; palps of prostomium forming branched gills; no pharynx or eversible buccal region; no septa in thorax, septa in abdomen regularly disposed. Nephridia in two series; lateral, anterior nephridia followed by small, short tubes in abdomen. The remaining groups are harder to define, with the exception of the (3) Capitellaformia, which are mud-living worms of an "oligochaetous" appearance, and with some affinities to that order. The peristomium has no setae, and the setae generally are hair-like or uncinate, often forming almost complete rings. The genital ducts are limited to one segment (the 8th in Capitella capitata), and there are genital setae on this and the next segment. In other forms genital ducts and nephridia coexist in the same segment. The nephridia are sometimes numerous in each segment. There is no blood system, and the coelomic corpuscles contain...
haemoglobin. (4) Terebelliformia. These worms are in some respects like the Sabellids (Cryptozoa). The parapodia, as in the Capitellidae, are hardly developed. The buccal region is unarmled and not eversible. The prostomium has many long filaments which recall the gills of the Sabellids, A teretis, and the nephridia of the segment, to which it is divided into two series, as in the last-mentioned worms. (5) Spioniformia (including Chaetopterus, Spiro, &c.) and (6) Scolopendria (Arenicolia, Chlorella, Neressispis) are the remaining groups. In both the nephridia are all alike; there are no jaws; the prostomium rarely has processes. The body is often divisible into regions.

OLIGOCHAETA.—As contrasted with the other subdivisions of the Chaetopoda, the Oligochaeta may be thus defined. Setae very rarely absent (genus Achaeta) and as a rule not so large or so numerous in each segment as in the Polychaeta, and different in shape. Eyes rarely present and then rudimentary. Prostomium generally small, sometimes prolonged, but never bearing tentacles or processes. Appendages of body reduced to branchiae, present only in a few species, and these often in the ventral direction. Appendages of Alma and Cridorhitis. Ciliated always present, extending over two (many limicolous forms) to forty-five segments (Alma). Segments of body numerous and not distinctive of species, being irregular and not fixed in numbers. In terrestrial forms dorsal pores are usually present; in aquatic forms a head pore only. Anus nearly always terminal, rarely dorsal, at a little distance from end of body. Suckers absent. Nervous system rarely (Aelosoma) subdivided, except with epimeris. Vascular system always present, forming a closed system, more complicated in the larger forms than in the aquatic genera. Several specially large contractile trunks in the anterior segments unifying the dorsal and ventral vessels. Nephridia generally paired, often very numerous in each segment, in the form of long, much-coiled tubes with intracellular lumen. Gonads limited in number of pairs, testes and ovaries always present in the same individual. Special sacs developed from the intersegmental septa lodge the developing ova and sperm. Special gonad ducts always present. Male ducts often open on to exterior through a terminal chamber which is variously specialized, and sometimes with a penis.

Generative pores usually paired, sometimes single and median. Spermathecae nearly always present. Alimentary canal straight, often with appended glands of complicated or simpler structure; no jaws. Eggs deposited in a cocoon after copulation. Development direct. Reproduction by budding also occurs. Fresh-water (rarely marine) and terrestrial.

The Oligochaeta show a greater variety of size than any other group of the Chaetopoda. They range from a millimetre or so (smaller species of Aelosoma) to 6 ft. or even rather more (Microchaeta rappi, &c.) in length.

Setae.—The setae, which are always absent from the peristomial segment, are also sometimes absent from a greater number of the anterior segments of the body, and have completely disappeared in Achaeta camerani. When present they are either arranged in four bundles of from one to ten or even more setae, or are disposed in continuous lines completely encircling each segment of the body. The latter arrangement characterizes many genera of the family Megascolidae and one genus (Periscales) of the Glossoscoletidae. It has been shown (Bourne) that the “perichaetous” condition is probably secondary, inasmuch as in worms which are, when adult, “perichaetous” the setae develop in pairs so that the embryo passes through a stage in which it has four bundles of setae, two to each bundle, the prevalent condition in the group. Rarely there is an irregular disposition of the setae which are not paired, though the total number is eight to a segment (fig. 10), e.g. Pontoscoles. The varying forms of the setae are illustrated in fig. 11.

Structure. — The body wall consists of an epidermis which secretes a delicate cuticle, and is only ciliated in Aelosoma, and in that genus only on the under surface of the prostomium. The epidermis contains numerous groups of sense cells; beneath the epidermis there is rarely (Kynotus) an extensive connective tissue dermis. Usually the epidermis is immediately followed by the circular layer of muscles, and this by the longitudinal coat. Beneath this again is a distinct peritoneum lining the coenelm, which appears to be wanting as a special layer in some Polychaetes (Benham, Gilson). The muscular layers are thin, layers in the aquatic forms, which possess only a single row of longitudinal fibres, or (Enchyclotrema) two layers. In the earthworms, on the other hand, this coat is thick and composed of many layers.

The cuticle consists of a thickening of the epidermis, and is of two forms among the Oligochaeta. In the aquatic genera the epidermis comes to consist entirely of glandular cells, which are, however, arranged in a single layer. In the earthworms, on the other hand, the epidermis becomes specialized into several layers of cells, all of which are glandular. It is therefore obviously much thicker than the cuticle in the limicolous forms. The position of the cuticle, which is universal in occurrence, varies much as does the number of component segments. As a rule—although, however, there are exceptions—the cuticle consists of two or three segments only in the small aquatic Oligochaeta, while in the terrestrial forms it is as a general rule, to which again there are exceptions, a more extensive, sometimes much more extensive, region.

In the Oligochaeta there is a closer correspondence between external metamorphosis and the divisions of the coelom than is apparent in some Chaetopods. The external segments are usually definable by the setae; and if the setae are absent, as in the anterior segments

**FIG. 10.** Diagrams of various Earthworms, to illustrate external characters. A, B, C, anterior segments from the ventral surface; D, hinder end of body of Urobea.

A. *Lumbricus*: 9, 10, segments containing spermathecae, the orifices of which are indicated; 14, segment bearing oviducal pores; 15, segment bearing male pores; 16, 17, 18, first and last segments of clitellum. B. *Acanthodrilus*: cp, orifices of spermathecae; v, oviducal pores; v, male pores; on 17th and 18th segments are the apertures of the atria. C. *Perichaeta*: the spermathecal pores and segments bearing them; 8, 9, oviducal pores upon the 14th and the male pores upon the 18th segment. D. *Eisenia*: in all the figures the nephridial pores are indicated by dots and the setae by strokes.
of several Geocoelidae, the nephridiopores indicate the segments; to each segment corresponds internally a chamber of the coelom which is separated from adjacent segments by transverse septa, which are only recognizable in the genus Aeolosoma and in the head region in Enchytraeidae. In the latter case, the numerous bands of muscle attaching the pharynx to the parietes have obliterated the regular partition by means of septa.

Nephridia.—The nephridia in this group are invariably coiled tubes which open to the exterior and vary in form and size. In addition to the cell by a funnel. There are no renal organs with a wide intercellular lumen, such as occur in the Polychaeta, nor is there ever any permanent association between nephridia and ducts connected with the coelomic cavities. The nephridia generally are of epidermal origin, such as Sacocirrus, &c. In these points the Oligochaeta agree with the Hirudinea. They also agree in the general structure of the nephridia. It has been ascertained that the nephridia of Oligochaeta are preceded in the Polychaeta by a ductless condition similar to that of the Hirudinea and Polychaeta, which are larval excretory organs. It is not quite certain whether these are to be regarded as the remnant of an earlier excretory system, replaced along the Oligochaeta by the nephridia and the coelomic cavities connected with the nephridia. In this case, the "head kidneys" are the first pair of nephridia precociously developed. The former view has been extensively held, and it is supported by the fact that in Octochaeta the first segment of the body contains a large number of nephridia which are the first of all represented by paired structures, the "pronephridia," in which the funnel is composed of two cement cells to which epithelium is added (Veidt, 1847). This disagrees with the view of V. V. Veidt (1847) that the pronephridia are the most ancient and that they occur in the earliest evolutionary stages of the group. It is more probable that the pronephridia are the remnants of the nephridiopores of the ancestral polychaete and that they have been reduced in later stages of evolution. The pronephridia of Oligochaeta are generally found in the animal, but in some cases they may be absent. In certain cases, the pronephridia are the only excretory organs of the animal, and they occur in the adult and larval stages. The pronephridia of Oligochaeta are generally represented by the ureter, which is a direct continuation of the nephridium.

Among the other families of Oligochaeta, the nephridia are generally found in the adult and larval stages. In the family Eudrilidae, the nephridia are generally represented by the ureter, which is a direct continuation of the nephridium. In the family Cephalodrilidae, the nephridia are generally represented by the ureter, which is a direct continuation of the nephridium. In the family Aculeodrilidae, the nephridia are generally represented by the ureter, which is a direct continuation of the nephridium. In the family Oligochaeta, the nephridia are generally represented by the ureter, which is a direct continuation of the nephridium. In the family Lumbricidae, the nephridia are generally represented by the ureter, which is a direct continuation of the nephridium. In the family Enchytraeidae, the nephridia are generally represented by the ureter, which is a direct continuation of the nephridium. In the family Geocoelidae, the nephridia are generally represented by the ureter, which is a direct continuation of the nephridium. In the family Aeolosoma, the nephridia are generally represented by the ureter, which is a direct continuation of the nephridium. In the family Aulodrilidae, the nephridia are generally represented by the ureter, which is a direct continuation of the nephridium.

The nephridia of Oligochaeta are generally represented by the ureter, which is a direct continuation of the nephridium. In the family Eudrilidae, the nephridia are generally represented by the ureter, which is a direct continuation of the nephridium. CHAETOPTERA

(as it appears) of the epidermis, and that it performs the function of a spermathea is shown by its containing spermatooza and, or, in Stagmomela, a spermathophore. In Polytomellus, also, spermathophores have been found in these spermathecal sacs. We have thus the replacement of a spermathophore, common to many of the remaining families of Oligochaeta, and derived, as is believed, from the epidermis, by a structure performing the same function, but derived from the mesoblastic tissues, and with a cavity which is coelomic.

Alimentary Canal.—The alimentary canal is always a straight tube, and the anus, save in the genera Criodrilus and Dero, is always terminal. A buccal cavity, a pharynx, an oesophagus and an intestine are always distinguishable. Commonly among annelidial forms there is a gizzard, or two gizzards, or a larger number, in the oesophageal region. There is no armed prostrusible pharynx, such as exists in some other Chaetopods. This may be associated with mud-eating habits; but it is nothing certain in this case; for in Cheiogyiater and Agrilirodos, which are predaceous worms, there is no prostrusible pharynx, though, in the latter the oesophagus is thickened through its extent with muscular fibres. The oesophagus is often furnished with glandular diverticula, the "glands of Morren," which are often of complex structure through the folding of their walls. Among the purely aquatic families such structures are rare, and are represented by two caeca in the genus Limnodrilodes. It is a remarkable fact, not yet understood, that in certain Enchytraeidae and Luminicladidae the spermathecae open into the oesophagus as well as on to the exterior. The only comparable fact among other worms is the Lauer's canal or genital intestinal canal in the Termites.

Two or three segments and more anterior in position than in Terricoela. Nephridia always paired and without plexus of blood capillaries. Spermatheca rarely with diverticula; sperm ducts as a rule occupying two segments only, usually opening by means of an anterio-terminal opening, generally much wider than the posterior opening, and with simple interior unidivided by a network of trabeculae. Ova large and with much yolk. Asexual reproduction only in Naidae. Egg sacs as large or nearly so as sperm sacs. Testes and ovaries always paired. The genera, viz. Naididae, Enchytraeidae, Tubificidae, Lumbriculidae, Phorocephidae, Phreodrilidae, Alliurididae, the latter possibly not referable to this group.

Group III. Moniligiad.—Moderate-sized to very large Oligochaeta, terrestrial in habit, with the appearance of Terricoela. Generative organs anterior in position as in Limicolae. Sperm ducts and atria as in Limicolae; egg sac large; body wall thick; vas deferens and nephridia as in Terricoela. Only one family, Moniligiadidae.

Group IV. Terricoela.—Earthworms, rarely aquatic in habit. Of small to very large size. Clitellum common, extensive and more posterior in position than in other groups. Vascular system complicated without regular connexion between dorsal and ventral vessels, except in anterior segments. Nephridia as a rule with abundant vascular supply. Testes, and occasionally ovaries, enclosed in sacs. Sperm sacs generally limited to one or two segments with interior subdivided by trabeculae. Sperm ducts traverse several segments on their way to exterior. They open in common with, or near to, or, more rarely, into, glands which are not certainly predaceous. Relative size of atria and testes functionless (?). Eggs minute with little yolk. Nephridia very numerous in each segment. Spermathecae often with diverticula.

Spermathecae are divided into the following families, viz. Mega- sclitidae, Geosclitidae, Eudrilidae, Lumbricidae.

As an appendix to the Oligochaeta, and possibly referable to that group, though their systematic position cannot at present be determined with certainty, is the family Discodrilliadidae (Discodrillius auct.), which are small parasites upon crayfish. These worms lay cocoons like the Oligochaeta and leeches, and where they depart from the structure of the Oligochaeta agree with that of leeches. The body is divided into ten segments (not more than fourteen), and there is a sucker at each end of the body. There are no setae and apparently only two pairs of nephridia, of which the anterior pair open commonly by a common pore on the third segment after the head, whose segments have not been accurately enumerated. The intervening segments contain the genitalia, which are on the Oligochaeta plan in that the gonads are independent of their ducts and that there are special spermathecae, one pair.

The eggs are either one or two pairs, which open by a common and complicated efferent terminal apparatus furnished with a prostrusible penis. The ganglia are crowded at the posterior end of the body as in leeches, and there is much tendency to the division of the alimentary canal almost into separate branches. These Cirrodrilus bear a few, or circles of, external processes which may be branched; Bdelloadrilid and Astacodrilus have none. The vascular system is as in the lower Oligochaeta. There are two chitinous larval, subcutaneous and ventral, which are of specially complicated structure in Cirrodrilus.

HIRUDINEA.—The leeches are more particularly to be compared with the Oligochaeta, and the following definition embraces the main features in which they agree and disagree with that group. Setae are only present in the genus Acanthobdella. Eyes are present, but hardly so complex as in certain genera of Polychaeta. The appendages of the body are reduced to branchiae, present in certain forms. A clitellum is present. The segments of body are few (not more than thirty-four) and fixed in number. The anus is dorsal. One or two (anterior and posterior) suckers always present. Nervous system always in coelom. Coelom generally reduced to a system of tubes, sometimes communicating with vascular system; in Acanthobdella and Oonbranchus a series of metamerically arranged chambers as in Oligochaeta. Nephridia always paired, rarely (Pontobdella) forming a network communicating from segment to segment; lumen of nephridia always intracellular, funnels pervers or imperious. Alimentary
canal sometimes with protrusible proboscis; never with gizzard or oesophageal glands; intestine with caeca as a rule. Jaws often present. Testes several pairs, rarely one pair, continuous with sperm ducts; ova-bearing, one pair, continuous with oviducts; generative pores single and median. No separate spermathecae or seminal chambers for the development of the ova and sperm. Eggs deposited in a cocoon. Development direct. No asexual generation. Fresh-water, marine and terrestrial. Parasitic or carnivorous.

In external characters the Hirudinea are unmistakable and not to be confused with other Annelida, except perhaps with the Bdello-drilidae, which resemble them in certain particulars. The absence of setae anterior in Acanthobdella, where five of the anterior segments possess each four pairs of setae with reserve setae placed close to them (fig. 14), and the presence of an anterior and posterior sucker, produce a looping mode of progression similar to that of a Geometrid larva. The absence of setae and the great secondary annulation render the mapping of the somatic annuli somewhat difficult. The most reliable test appears to be the nerve ganglia, which are more distinct from the intervening connectives than in other Annelids.

In the middle of the body, where the limits of the somites can be checked by a comparison with the arrangement of the nephridia and the gonads, and where the ganglia are quite distinct and separated by long connectives, each ganglion is seen to consist of six masses of cells enclosed by capsules and to give off three nerves on each side. This corresponds to the usual presence (in the Rhyncho- bdellidae) of at least three nerves per segment. Anterior and posterior separate ganglia have fused. The nephridia are not only a group of six capsules corresponding to the archi-

CHAETOPODA

Coelom.—The coelom of the Hirudinea differs in most genera from that of the Oligochaeta and Polychaeta. The difference is that it is broken up into a complex sinus system. The least modified type is shown by Acanthobdella, a leech, parasitic upon fishes, in which transverse sections (see figs. 15 and 16) show the gut, the nervous system, &c., lying in a spacious chamber which is the coelom. This coelom is lined by peritoneal cells and is divided into a series of metameres by septa which correspond to the segmentation of the body, the arrangement being thus precisely like that of typical Chaetopoda. Moreover, upon the intestine the coelomic cells are modified into chloragogenous cells. In Acanthobdella the testes are, however, not retained in the general coelom, and the nephridia lie in the septa. It is remarkable in view of the spaciousness of the coelom, that the funnels of the latter have not been seen. Ozo-

in them. In addition to the median lacuna there are two lateral lacunae, one upon each side. These regions of the coelom end at the ends of the body and communicate with each other by means of a branched system of coelomic sinuses, which are in places very fine tubes. Neither in this genus nor in the last is there any communication between coelom and vascular system. In Clepsine (Glossiphonia) there is a further breaking up of the coelom. The median lacuna no longer exists, but is represented by a dorsal and ventral sinus. The former lodges the dorsal, the latter the ventral, blood-vessel. The gut has no coelomic space surrounding it. A complex

network places these sinuses and the lateral sinuses in communication. Here also the blood system has no communication with the sinus system of the coelom. In Hirudo and the Gnathobdellidae there is only one system of cavities which consist of four principal longitudinal cavities, of which the lateral and posterior of which are not in communication. The network is partly formed out of pigmented cells which are excavated and join to form tubes, the so-called "carotids," which are not found amongst the Rhynchocephala. It is seen clearly from the central cavities of A. G. Bourne and E. S. Goodrich that the vascular system and the coelom are in communication (as in vertebrates by means of the lymph system). On the other hand, it has been held that in these leeches there is no vascular system at all and that the entire network is in contact with all the cells of the epidermis. In favour of regarding the vascular system as totally absent, is the fact that the median coelomic channels contain no dorsal and ventral vessel. In favour of seeing in the lateral trunks and their branches general vessels, is the fact that the intrusion of the latter into the epidermis, marked among the Oligochaeta, where undoubted blood capillaries perforate the epidermis. A further fact must be considered in deciding this question. The discovery of a network of sinus and vessels (in characters, however, are present amongst other Oligochaeta). The testes are more numerous than the ovaries, of which latter there are never more than one pair. The testes vary in numbers of pairs, from a single pair (Glossiphonia) to ten pairs (Planococcus) are common numbers. In Acanthobdellida, however, the testes of each side of the body have grown together to form a continuous band, which extends in front of external pore. Each testis communicates by a duct with the common collecting duct of its side of the body, which opens on to the external pore by means of a pro- trusible penis, and to which is sometimes appended a seminal vesicle. The efferent ducts are dilated, and there is a patch of cilia at the point of union of their walls, the efferent ducts being so closely applied to the active system (e.g. Osobranchus) than in others, where they are small rounded bodies. The two ducts join as the gonads open by a common vagina near to the testes and which is connected by a duct to the exterior of the body. This 3. vagina is sometimes of exaggerated size. Thus, in Philaemon pungens (Lambert) it has the form of a large sac, into which open by a single orifice the con- joined oviducts. From this vagina arises a narrow duct leading to the exterior. In Osobranches the structure in question is still more elaborated. The two ovaries communicate with the exterior by a transverse bridge uniting to form the terminal canal. Into each ovarian sac when the transverse junction opens a slender tube, which is greatly coiled, and, in its turn, opens into a spherical sac, which is divided from this an equally large cavity, which proceeds, which joins its fellow of the opposite side, and the two form a thick, walled tube, which opens on to the exterior through a dorsal pore. The testes produce an oviduct by means of the testes. This oviducts are more numerous than the ovaries, of which latter there are never more than one pair. The testes vary in numbers of pairs, from a single pair (Glossiphonia) to ten pairs (Planococcus) are common numbers. In Acanthobdellida, however, the testes of each side of the body have grown together to form a continuous band, which extends in front of external pore. Each testis communicates by a duct with the common collecting duct of its side of the body, which opens on to the external pore by means of a pro- trusible penis, and to which is sometimes appended a seminal vesicle. The efferent ducts are dilated, and there is a patch of cilia at the point of union of their walls, the efferent ducts being so closely applied to the active system (e.g. Osobranchus) than in others, where they are small rounded bodies. The two ducts join as the gonads open by a common vagina near to the testes and which is connected by a duct to the exterior of the body. This 3. vagina is sometimes of exaggerated size. Thus, in Philaemon pungens (Lambert) it has the form of a large sac, into which open by a single orifice the con- joined oviducts. From this vagina arises a narrow duct leading to the exterior. In Osobranches the structure in question is still more elaborated. The two ovaries communicate with the exterior by a transverse bridge uniting to form the terminal canal. Into each ovarian sac when the transverse junction opens a slender tube, which is greatly coiled, and, in its turn, opens into a spherical sac, which is divided from this an equally large cavity, which proceeds, which joins its fellow of the opposite side, and the two form a thick, walled tube, which opens on to the exterior through a dorsal pore. The testes produce an oviduct by means of the testes.
dung and others on vegetable tissues. The cockchafer and their near allies belong to the subfamily Melolonthinae, and the rose chafer, Cetonia aurata, in both the beetles eat leaves, and their grubs spend a long life underground devouring roots.

In Britain the Melolonthinae that are usually noted as injurious are the two species of cockchafer (Melolontha vulgaris and M. hippocastani), large heavy beetles with black pubescent prothorax, brown elytra and an elongated pointed tail-process; the summer-chafer (Rhysiotrogus solstitialis), a smaller pale brown chafer; and the still smaller garden-chafer or “cocker-bundy” (Phyllopertha hortica), which has a dark green prothorax and brown elytra. Of the Cetoniines, the beautiful metallic green rose-chafer, Cetonia aurata, sometimes causes damage, especially in gardens. The larvae of the chafer are heavy, soft-skinned grubs, with hard brown heads provided with powerful mandibles, three pairs of well-developed legs, and a swollen abdomen. As they grow, the larvae become strongly flexed towards the ventral surface, and lie curled up in their earthen cells, feeding on roots. The larval life lasts several years, and in hard frosts the grubs go deep down away from the surface.

Pupation takes place in the autumn, and though the perfect insect emerges from the cuticle very soon afterwards, it remains in its underground cell for several months, not making its way to the upper air until the ensuing summer. After pairing, the female crawls down into the soil to lay her eggs. The grubs of chafer, when turned up by the plough, are greedily devoured by poultry, pigs and various wild birds. When the beetles become so numerous as to call for destruction, they are usually shaken off the trees where they rest on to sheets or tarred boards.

On the continent of Europe chafer are far more numerous than in the United Kingdom, and the rural governments in France give rewards for their destruction. D. Sharp states that in the department of Seine-inferieure 867,173,000 cockchafers and 647,000,000 larvae were killed in the four years preceding 1879.

The anatomy of Melolontha is very fully described in a classical memoir by E. Strauss-Dürckheim (Paris, 1828). (G. H. C.)

CHAFF (from the A.S. ceaf, allied to the O. High Ger. cheta, a husk or pod), the husks left after threshing grain, and also hay and straw chopped fine as food for cattle; hence, figuratively, the refuse or worthless part of anything. The colloquial use of the word, to chaff, in the sense of to banter or to make fun of a person, may be derived from this figurative sense, or from “to chafe,” meaning to vex or irritate.

CHAFFARINAS, or ZAFFARINES, a group of islands belonging in Spain off the north coast of Morocco, near the Algerian frontier, 2½ m. to the north of Cape del Agua. The largest of these islands, Del Congo, is rocky and hilly. It has a watchtower on the coast nearest to Morocco. Isabella II., the central island, contains several batteries, barracks and a penal convict settlement. The Spanish government has undertaken the construction of breakwaters to unite this island with the neighbouring islet of El Rey, with a view to enclose a deep and already sheltered anchorage. This roadstead affords a safe refuge for many large vessels. The English, French and Spanish, through subsidence; a few—Egmont, Danger, Eagle, and Three Brothers—still remain on the east side, but most of the population (about 700) is centered on Diego Garcia, which lies on the south-east side, and is nearly 13 m. long by 6 m. wide. The lagoon, which is enclosed by two coral barriers and accessible to the largest vessels on the north side, forms one of the finest natural harbours in the world. The group, which has a total land area of 76 sq. m., is dependent for administrative purposes on Mauritius, and is regularly visited by vessels from that colony. The only product is cocoa-nut oil, of which about 116,000 gallons are annually exported. The French occupied the islands in 1791 from Mauritius, and the oil industry (from which the group is sometimes called the Oil Islands) came into the hands of French Creoles.

CHAGRES, a village of the Republic of Panama, on the Atlantic coast of the Isthmus, at the mouth of the Chagres river, and about 8 m. W. of Colon. It has a harbour from 10 to 12 ft. deep, which is difficult to enter, however, on account of the bar at its mouth. The port was discovered by Columbus in

reverting for a time to the rank of brigadier-general, he was made a major-general U.S.V. again in 1900 and was appointed to command the United States contingents in China. He took a brilliant and successful part in the advance on Peking and the relief of the Legations. In 1901 he became a major-general in the regular army, and in 1901–1902 commanded the Division of the Philippines. In 1902–1903 he commanded the Department of the East, and from 1904 to 1906 was chief of the general staff of the army. He was promoted to the rank of lieutenant-general in the United States army, being the first enlisted man of the regular army to attain this, the highest rank in the service. He was retired at his own request on the 1st of February 1906, after more than forty years' service.
1592, and was opened for traffic with Panama, on the Pacific coast, by way of the Chagres river, in the 16th century. With the decline of Porto Bello in the 18th century Chagres became the chief Atlantic port of the Isthmus, and was at the height of its importance during the great rush of gold-hunters across the Isthmus to California in 1849 and the years immediately following. With the completion of the Panama railway in 1855, however, travel was diverted to Colon, and Chagres soon became a village of miserable huts, with no evidence of its former importance. On a high rock at the mouth of the river stands the castle of Lorenzo, which was destroyed by Sir Henry Morgan when he captured the town in 1671, but was rebuilt soon afterwards by the Spaniards. Chagres was again captured in 1740 by British forces under Admiral Edward Vernon.

CHAIN (through the O. Fr. chaine, chaine, &c., from Lat. catena), a series of links of metal or other material so connected together that the whole forms a flexible band or cord. Chains are used for a variety of purposes, such as fastening, securing, or connecting together two or more objects, supporting or lifting weights, transmitting mechanical power; &c.; or as an ornament to serve as a collar, as a symbol of office or state, or as part of the insignia of an order of knighthood; or as a device from which to hang a jewelled or other pendant, a watch, &c. (see COLLAR). Ornamental chains are made with a great variety of links, but those intended for utilitarian purposes are mostly of two types. In stud chains a stud or brace is inserted across each link to prevent its sides from collapsing inwards under strain, whereas in open link chains the links have no studs. The addition of studs is reckoned to increase the load which the chain can safely bear by 50%. Small chains of the open-link type are to a great extent made by machinery. For larger sizes the smith cuts off a length of iron rod of suitable diameter, forms it while hot to the shape of the link by repeated blows of his hammer, and welds together the two ends of the link, previously slipped inside its fellow, by the aid of the same tool; in some cases the bending is done in a mechanical press and the welding under a power hammer (see also CABLE). Weldless chains are also made; in A. G. Stratham’s process, for instance, cruciform steel bars are pressed, while hot, into links, each without joint and engaging with its neighbours. Chains used for transmitting power are known as pitch-chains; the chain of a bicycle (q.v.) is an example. From the use of the chain as employed to bind or fetter a prisoner or slave, comes the figurative application to anything which serves as a constraining or restraining force; and from its series of connected links, to any series of objects, events, arguments, &c., connected by succession, logical sequence of reasoning. Specific uses are for a measuring line in land-surveying, consisting of 100 links, i.e. iron rods, 7-92 in. in length, making 22 yds. in all, hence a linear measure of that length; and, as a nautical term, for the contrivance by which the lower shrouds of a mast are extended and secured to the ship’s sides, consisting of dead-eyes, chain-plates, and chain-wale or “channel.”

CHAIR (in Mid. Eng. cheere, through O. Fr. chaire or chaire, from Lat. cathedra, later calenda, Gr. καθίσμα, seat; cf. “cathedral”); the modern Fr. form chaise, a chair, has been adopted in English with a particular meaning as a form of carriage; chaire in French is still used of a professorial or ecclesiastical “chair,” or cathedra); a movable seat, usually with four legs, for a single person, the most varied and familiar article of domestic furniture. The chair is of extreme antiquity, although for many centuries and indeed for thousands of years it was an appendage of state and dignity rather than an article of ordinary use. “The chair” is still extensively used as the emblem of authority in the House of Commons and in public meetings. It was not, in fact, until the 16th century that it became common anywhere. The chest, the bench and the stool were until then the ordinary seats of everyday life, and the number of chairs which have survived from an earlier date is exceedingly limited; most of such examples are of ecclesiastical or seigneurial origin. Our knowledge of the chairs of remote antiquity is derived almost entirely from monuments, sculpture and paintings. A few actual examples exist in the British Museum, in the Egyptian museum at Cairo, and elsewhere. In ancient Egypt they appear to have been of great richness and splendour. Fashioned of ebony and ivory, or of carved and gilded wood, they were covered with costly stuffs and supported upon representations of the legs of beasts of the chase or the figures of captives. An arm-chair in fine preservation found in a tomb in the Valley of the Kings is astonishingly similar, even in small details, to that “Empire” style which followed Napoleon’s campaign in Egypt. The earliest monuments of Nineveh represent a chair without a back but with tastefully carved legs ending in lions’ claws or bulls’ hoofs; others are supported by figures in the nature of caryatides or by animals. The earliest known form of Greek chair, going back to five or six centuries before Christ, had a back but stood straight up, front and back. On the frieze of the Parthenon Zeus occupies a square seat with a back and thick turned legs; it is ornamented with winged sphinxes and the feet of beasts. The characteristic Roman chairs were of marble, also adorned with sphinxes; the curule chair was originally very similar in form to the modern folding chair, but eventually received a good deal of ornament.

The most famous of the very few chairs which have come down from a remote antiquity is the reputed chair of St Peter in St Peter’s at Rome. The wooden portions are much decayed, but it would appear to be Byzantine work of the 6th century, and to be really an ancient sedio gestatoria. It has ivory carvings representing the labours of Hercules. A few pieces of an earlier oaken chair have been let in; the existing one, Gregorovius says, is of acacia wood. The legend that this was the curule chair of the senator Pudentus is necessarily apocryphal. It is not, as is popularly supposed, enclosed in Bernini’s bronze chair, but is kept under triple lock and exhibited only once in a century. Byzantium, like Greece and Rome, affected the curule form of chair, and in addition to lions’ heads and winged figures of Victory and dolphin-shaped arms used also the lyre-back which has been made familiar by the pseudo-classical revival of the end of the 18th century. The chair of Maximin in the cathedral of Ravenna is believed to date from the middle of the 6th century. It is of marble, round, with a high back, and is carved in high relief with figures of saints and scenes from the Gospels—the Annunciation, the Adoration of the Magi, the flight into Egypt and the baptism of Christ. The smaller spaces are filled with carvings of animals, birds, flowers and foliated ornament. Another very ancient seat is the so-called “Chair of Dagobert” in the Louvre. It is of cast bronze, sharpened with the chisel and partially gilt; it is of the curule or falstaff type and supported upon legs terminating in the heads and feet of fantastic animals, the seat, which was probably of leather, has disappeared. Its attribution depends entirely upon the statement of Suger, abbot of St Denis in the 12th century, who added a back and arms. Its age has been much discussed, but Viollet-le-Duc dated it to early Merovingian times, and it may in any case be taken as the oldest falstaff in existence. To the same generic type belongs the famous abbots’ chair of Glastonbury; such chairs might readily be taken to pieces when their owners travelled. The falduestierum in time acquired arms and a back, while retaining its folding shape. The most famous, as well as the most ancient, English chair is that made at the end of the 13th century for Edward I., in which most subsequent monarchs have been crowned. It is of an architectural type and of oak, and was covered with gilded gesso which long since disappeared. The stalls of the monks terminating in the heads and feet of fantastic animals, which we find the chair monopolized by the ruler, lay or ecclesiastical, to a comparatively late date. As the seat of authority it stood at the head of the lord’s table, on his dais, by the side of his bed. The seigneurial chair, commoner in France and the Netherlands than in England, is a very interesting type, approximating in many respects to the episcopal or abbatial throne or stall. It early acquired a very high back and sometimes had a canopy. Arms were invariable, and the lower part was closed in with panelled or carved front and sides—the seat, indeed, was often hinged and
sometimes closed with a key. That we are still said to sit "in" an arm-chair and "on" other kinds of chairs is a reminiscence of the time when the lord was expected "in his chair." These throne-like seats were always architectural in character, and as Gothic feeling waned took the distinctive characteristics of Renaissance work. It was owing in great measure to the Renaissance that the chair ceased to be an appanage of state, and became the customary companion of whosoever could afford to buy it. Once the idea of privilege faded the chair speedily came into general use, and almost at once began to reflect the fashions of the hour. No piece of furniture has ever been so close an index to sumptuary changes. It has varied in size, shape and sturdiness with the fashion not only of women's dress but of men's also. Thus the chair which was not, even with its arms purposely suppressed, too ample during the several reigns of some form or other of hoops and farthingale, became monstrous when these protuberances disappeared. Again, the costly laced coats of the dandies of the 18th and early 19th centuries were so threatened by the ordinary form of seat that a "conversation chair" was devised, which enabled the buck and the ruffler to sit with his face to the back, his valuable tails hanging unimpeded over the front. The early chair almost invariably had arms, and it was not until the close of the 18th century that the smaller form grew common.

The majority of the chairs of all countries until the middle of the 17th century were of oak without upholstery, and when it became customary to cushion them, leather was sometimes employed; subsequently velvet and silk were extensively used, and at a later period cheaper and often more durable materials. Leather was not infrequently used even for the costly and elaborate chairs of the faldstool form—occasionally sheathed in thin plates of silver—which Venice sent all over Europe. To this day, indeed, leather is one of the most frequently employed materials for chair covering. The outstanding characteristic of most chairs until the middle of the 17th century was massiveness and solidity. Being usually made of oak, they were of considerable weight, and it was not until the introduction of the handsome Louis XIII. chairs with cane backs and seats that either weight or solidity was reduced. Although English furniture derives so extensively from foreign and especially French and Italian models, the earlier forms of English chairs have an independence of character which makes it easy to distinguish them from their prototypes. Thus it was essentially the case to the end of the Tudor period, after which France began to set her mark upon the British chair. The squat variety, with heavy and sombre back, carved like a piece of panelling, gave place to a taller, more slender, and more elegant form, in which the framework only was carved, and attempts were made at ornament in new directions. The stretcher especially offered opportunities which were not lost upon the cabinet-makers of the Restoration. From a mere uncompromising cross-bar intended to strengthen the construction it blossomed, almost suddenly, into an elaborate scroll-work or an exceedingly graceful semicircular ornament connecting all four legs, with a vase-shaped knob in the centre. The arms and legs of chairs of this period were scrolled, the spats of the back often showing a rich arrangement of spirals and scrolls. This most decorative of all types appears to have been popularized in England by the cavaliers who had been in exile with Charles II. and had become familiar with it in the north-western parts of the European continent. During his reign of William and Mary these charming forms degenerated into something much stiffer and more rectangular, with a solid, more or less fiddle-shaped splat and a cabriole leg with pad feet. The more ornamental examples had cane seats and ill-proportioned cane backs. From these forms was gradually developed the Chippendale chair, with its elaborately interlaced back, its graceful arms and square or cabriole legs, the latter terminating in the claw and ball or the pad foot. Hepplewhite, Sheraton and Adam all aimed at lightening the chair, which, even in the master hands of Chippendale, remained comparatively heavy. The endeavour succeeded, and the modern chair is everywhere comparatively slight. Chippendale and Hepplewhite between them determined what appears to be the final form of the chair, for since their time practically no new type has lasted, and in its main characteristics the chair of the 20th century is the direct derivative of that of the later 18th.

The 18th century was, indeed, the golden age of the chair, especially in France and England, between which there was considerable give and take of ideas. Even Diderot could not refrain from writing of them in his Encyclopédie. The typical Louis Seize chair, oval-backed and ample of seat, with descending arms and round-reeded legs, covered in Beauvais or some such gay tapestry woven with Boucher or Watteau-like scenes, is a very gracious object, in which the period reached its high-water mark. The Empire brought in squat and squabby shapes, comfortable enough no doubt, but entirely destitute of inspiration. English Empire chairs were often heavier and more sombre than those of French design. Thenceforward the chair in all countries ceased to attract the artist. The art nouveau school has occasionally produced something of not unpleasing simplicity; but more often its efforts have been frankly ugly or even grotesque. There have been practically no novelties, with the exception perhaps of the basket-chair and such like, which have been made possible by modern command over material. So much indeed in the present instance to the point in this matter that even the revolving chair, now so familiar in offices, has a pedigree of something like four centuries (see also SEDAN-CHAIR).

CHAISE (the French for "chair," through a transference from a "sedan-chair" to a wheeled vehicle), a light two- or four-wheeled carriage with a movable hood or "calash"; the "post-chaise" was the fast-travelling carriage of the 18th and early 19th centuries. It was closed and four-wheeled for two or four horses and with the driver riding postillion.

CHAKRATA, a mountain cantonment in the Dehra Dun district of the United Provinces of India, on the range of hills overlooking the valleys of the Jamna and the Tons, at an elevation of 7000 ft. It was founded in 1866 and first occupied in April 1869.

CHALCEDON, more correctly CALCEDON (mod. Kadikoi), an ancient maritime town of Bithynia, in Asia Minor, almost directly opposite Byzantium, south of Scutari. It was a Meagarian colony founded on a site so obviously inferior to that which was ultimately occupied by Constantinople, that it received from the oracle the name of "the City of the Blind." In its early history it shared the fortunes of Byzantium, was taken by the satrap Otanes, vacillated long between the Lacedaemonians and the Athenian interests, and was at last bequeathed to the Romans by Attalus III. of Pergamum (133 B.C.). It was partly destroyed by Mithradates, but recovered during the Empire, and in A.D. 451 was the seat of the Fourth General Council. It fell under the repeated attacks of the barbarian hordes who crossed over after having ravaged Byzantium, and furnished an encampment to the Persians under Chosroes, c. 616–626. The Turks used it as a quarry for building materials for Constantinople. The site is now occupied by the village of Kadikoi ("Village of the Judge"), which forms the tenth "circle" of the municipality of Constantinople. Pop. about 33,000, of whom 8000 are Moslems. There is a large British colony with a church, and also Greek and Armenian churches and schools, and a training college for Roman Catholic Armenians. To the S. are the ruins of Panteichion (mod. Pandrik), where Belisarius is said to have died. For further information see CHALCEDON, COUNCIL OF.

See J. von Hammer, Constantinopolis (Pesth, 1822); Murray's Handbook for Constantinople (London, 1900).

CHALCEDON, COUNCIL OF, the fourth ecumenical council of the Catholic Church, was held in 451, its occasion being the Eutychian heresy and the notorious "Robber Synod" (see EUTYCHES and EPHESIUS, COUNCIL OF), which called forth vigorous protests both in the East and in the West, and a loud demand for a new general council, a demand that was ignored by the Eutychian Theodosius II., but speedily granted by his successor, Marcian, a "Flavianist." In response to the imperial summons, five to six hundred bishops, except all Eastern, were gathered in Rome legates and two Africans, assembled in Chalcedon on the
8th of October 451. The bishop of Rome claimed for his legates the right to preside, and insisted that any act that failed to receive their approval would be invalid. The first session was tumultuous; party feeling ran high, and scurrilous and vulgar epithets were bandied to and fro. The acts of the Robor Synod were examined; fraud, violence and coercion were charged against it; its entire proceedings were annulled, and, at the third session, its leader, Dioscurus, was deposed and degraded. The emperor requested a declaration of the true faith; but the sentiment of the council was opposed to a new symbol. It contended itself with reaffirming the Nicene and Constantinopolitan creeds and the Ephesine formula of 431, and accepting, only after examination, the Christological statement contained in the Epistola Dogmatica of Leo I. (q.v.) to Flavianus. Thus the council rejected both Nestorianism and Eutychianism, and stood upon the doctrine that Christ had two natures, each perfect in itself and each distinct from the other, yet perfectly united in one person, who was at once both God and Man. With this statement, which was formally subscribed in the presence of the emperor, the development of the Christological doctrine was completed, but not in a manner to obviate further controversy (see MONOPHYSITES and MONOTHELETES).

The remaining sessions, vii.—xvi., were occupied with matters of discipline, complaints, claims, controversies and the like. Canons were adopted, thirty according to the generally received tradition, although the most ancient texts contain but twenty-eight, and, as Hefele points out, the so-called twenty-ninth and thirtieth are properly not canons, but repetitions of proposals made in a previous session.

The most important enactments of the council of Chalcedon were the following: (1) the approval of the canons of the first three ecumenical councils and of the synods of Ancyræa, Neo-Caesarea, Changra, Antioch and Laodicea; (2) forbidding trade, secular pursuits and war to the clergy, bishops not even being allowed to administer the property of their dioceses; (3) forbidding monks and nuns to marry or to return to the world; likewise forbidding the establishment of a monastery in any diocese without the consent of the bishop, or the disestablishment of a monastery once consecrated; (4) punishing with deposition an ordination or clerical appointment made for money; forbidding “absolute ordination” (i.e. without assignment to a particular charge), the translation of clerics except for good cause, the enrolment of a cleric in two churches at once, and the performance of sacerdotal functions outside of one’s diocese without letters of commendation from one’s bishop; (5) confirming the jurisdiction of bishops over all clerics, regular and secular alike, and punishing with deposition any conspiracy against episcopal authority; (6) establishing a gradation of ecclesiastical tribunals, viz. bishop, provincial synod, exarch of the diocese, patriarch of Constantinople (obviously the council could not here have been legislating for the entire church); forbidding clerics to be running to Constantinople with complaints, without the consent of their respective bishops; (7) confirming the possession of rural parishes to those who had actually administered them for thirty years, providing for the adjudication of conflicting claims, and guaranteeing the integrity of metropolitan provinces; (8) confirming the third canon of the second ecumenical council, which accorded to Constantinople equal privileges (σας πρωεδρια) with Rome, and the second rank among the patriarchates, and, in addition, granting to Constantinople patriarchal jurisdiction over Pontus, Asia and Thrace.

The Roman legates, who were absent (designedly?) when this famous twenty-eighth canon was adopted, protested against it, but in vain, the imperial commissioners deciding in favour of its regularity and validity. Leo I., although he recognized the council as ecumenical and confirmed its doctrinal decrees, rejected canon xxviii. on the ground that it contravened the sixth canon of Nicaea and infringed the rights of Alexandria and Antioch.

In what proportion zeal for the ancient canons and the rights of others, and jealous fear of encroachment upon his own jurisdiction, were mixed in the motives of Leo, it would be interesting to know. The canon was universally received in the East, and was expressly confirmed by the Quinisext Council, 692 (see CONSTANTINOPLE, COUNCILS OF).

The emperor Marcian approved the doctrinal decrees of the council and enjoined silence in regard to theological questions. Eutyches and Dioscurus and their followers were deposed and banished. But harmony was not thus to be restored; hardly had the council dissolved when the church was plunged into the Monophysite controversy.

CHALCEDONY, or CALCEDONY (sometimes called by old writers cassiopeine), a variety of native silica, often used as an ornamental stone. The present application of the term is comparatively modern. The “chalcedonius” of Pliny was quite a different mineral, being a green stone from the copper-mines of Chalcedon, in Asia Minor, whence the name. There has been some confusion between chalcedony and the ancient “carcelonion,” a stone which seems to have been a carbuncle from Africa, brought by way of Carthage (Καρχηδόν). Our chalcedony was probably included by the ancients among the various kinds of Jasper and Agate, especially the varieties termed “leucachates” or “cerachates.”

By modern mineralogists the name chalcedony is restricted to those kinds of silica which occur not in distinct crystals like ordinary quartz, but in concretionary, marmillated or stalactitic forms, which break with a fine splintered fracture, and display a delicate fibrous structure. Chalcedony may be regarded as a micro-crystalline form of quartz. It is rather softer and less dense than crystallized quartz, its hardness being about 6.5 and its specific gravity 2.6, the difference being probably due to the presence of a small amount of opaline silica between the fibres. Chalcedony is a translucent substance of rather waxy lustre, presenting great variety of colours, though usually white, grey, yellow or brown. A rare blue chalcedony is sometimes polished under the name of “saphirine”—a term applied also to a distinct mineral (an aluminium-magnesium silicate) from Greenland.

Chalcedony occurs as a secondary mineral in volcanic rocks, representing usually the silica set free by the decomposition of various silicates, and deposited in cracks, forming veins, or in vesicular hollows, forming amygdalae. Its occurrence gives the name to Chalcedony Park, Arizona. It is found in the basalt of N. Ireland, the Faroe Isles and Iceland: it is common in the traps of the Deccan in India, and in volcanic rocks in Uruguay and Brazil. Certain flat oval nodules from a decomposed lava (augite-andesite) in Uruguay present a cavity lined with quartz crystals and enclosing liquid (a weak saline solution), with a movable air-bubble, whence they are called “enhydro” or water-stones. Very fine examples of stalactitic chalcedony, in whismatic forms, have been yielded by some of the Cornish copper-mines. The surface of chalcedony is occasionally coated with a delicate bluish bloom. A chalcedonic deposit in the form of concentric rings, on fossils and fragments of limestone in S. Devon, is known as “orbicular silica” or “beekite,” having been named after Dr Henry Beeke, dean of Bristol, who first directed attention to such deposits. Certain pseudomorphs of chalcedony after datolite, from Haytor in Devonshire, have received the name of “haytorte.” Optical examination of many chalcedonic minerals by French mineralogists has shown that they are aggregates of various fibrous crystalline bodies differing from each other in certain optical characteristics, whereas they are distinguished as separate minerals under such names as calcedonite, pseudocalcedonite, quartzite, luteceite and lusatite. Many coloured and variegated chalcedonies are cut and polished as ornamental stones, and are described under special headings. Chalcedony has been in all ages the commonest of the stones used by the gem-engraver.

CHALCIDICUM—CHALDAEA

CHALCIDICUM, in Roman architecture, the vestibule or portico of a public building opening up to the forum; as in the basilica of Eumachia at Pompeii, and the basilica of Constantine at Rome, where it was placed at one end.

CHALCIS, the chief town of the island of Euboea in Greece, situated on the strait between the Euboeans at its narrowest point. The name is preserved from antiquity and is derived from the Greek χαλκός (copper, bronze), though there is no trace of any mines in the neighbourhood. Chalcis was peopled by an Ionic stock which early developed great industrial and colonizing activity. In the 8th and 7th centuries it founded thirty towns on the peninsula of Chalcidice, and several important cities in Sicily (q.v.). Its mineral produce, metal-work, purple and pottery not only found markets among these settlements, but were distributed over the Mediterranean in the ships of Corinth and Samos. With the help of these allies Chalcis engaged the rival league of its neighbour Eretria (q.v.) in the so-called Lelantine War, by which it acquired the best agricultural district of Euboea and became the chief city of the island. Early in the 6th century its prosperity was broken by a disastrous war with the Athenians, who expelled the ruling aristocracy and settled a cleruchy on the site. Chalcis subsequently became a member of both the Delian League. In the Hellenistic period it gained importance as a fortress by which the Macedonian rulers controlled central Greece. It was used by kings Antiochus III. of Syria (192) and Mithradates VI. of Pontus (89) as a base for invading Greece. Under Roman rule Chalcis declined as a measure of prosperity since the 6th century A.D. it again served as a fortress for the protection of central Greece against northern invaders. From 1209 it stood under Venetian control; in 1470 it passed to the Ottomans, who made it the seat of a pasha. In 1688 it was successfully held against a strong Venetian attack. The modern town has about 10,000 inhabitants, and maintains a considerable export trade which received an impetus from the establishment of railway connexion with Athens and Peiraeus (1904). It is composed of two parts—the old walled town towards the Euripus, called the Castro, where the Jewish and Turkish families who have remained there mostly dwell; and the more modern suburb that lies outside it, which is chiefly occupied by the Greeks. A part of the walls of the Castro and many of the houses within it were shaken down by the earthquake of 1864; part has been demolished in the widening of the Euripus. The most interesting object is the church of St Paraskeve, which was once the chief church of the Venetians; it dates from the Byzantine period, though many of its architectural features are Western. There is also a Turkish mosque, which is now used as a guard-house.

Dornoff, Die Delphische Patrozinien (Göttingen, 1889); for coinage, B. V. Head, Historia Numorum (Oxford, 1887), pp. 303-5; and art. Numismatics: Greek § Euboea.

CHALCONDYLES (or CHALCOONDYLAS), LAONICUS, the only Athenian Byzantine writer. Hardly anything is known of his life. He wrote a history, in ten books, of the period from 1298-1463, describing the fall of the Greek empire and the rise of the Ottoman Turks, which forms the centre of the narrative, down to the conquest of the Venetians and Mathias, king of Hungary, by Mahomed II. The capture of Constantinople he rightly regarded as an historical event of far-reaching importance, although the comparison of it to the fall of Troy is hardly appropriate. The work incidentally gives a quaint and interesting sketch of the manners and civilization of England, France and Germany, whose assistance the Chalcidians sought to obtain against the Turks. Like that of other Byzantine writers, Chalcondyles' history is defective, and his adherence to the old Greek geographical nomenclature is a source of confusion. For his account of earlier events he was able to obtain information from his father, who was one of the most prominent

men in Athens during the struggles between the Greek and Frankish nobles. His model is Thucydides (according to Bekker, Herodotus); his language is tolerably pure and correct, his style simple and clear. The text, however, is in a very corrupt state.

chlix. There is a French translation by Blaise de Vigenère (1577, later ed. by Artus Thomas with valuable illustrations on Turkish matters); see also P. Gregorovius, Geschichte der Stadt Ahlen im Mittelalter, ii. (1889); Gibbon, Decline and Fall, ch. 66; C. Krumbacher, Geschichte der byzantinischen Literatur (1897). There is a biographical sketch of Laonicus and his brother in Greek by Antonius Caloeus, a physician of Toledo, who lived in the latter part of the 16th century (see C. Hopf, Chroniques gréco-romanes, 1873).

His brother, DEMETRIUS CHALCONDYLES (1424-1511), was born in Athens. In 1447 he migrated to Italy, where Cardinal Bessarion gave him his patronage. He became famous as a teacher of Greek letters and the Platonic philosophy; in 1493 he was made professor at Padua, and in 1470 he was summoned by Lorenzo de' Medici to Florence to fill the professorship vacated by John Argyropoulos. In 1492 he removed to Milan, where he died in 1511. He was associated with Marsilius Ficinus, Angelus Politianus, and Theodorus Gaza, in the revival of learning in the western world. One of his pupils at Florence was the famous John Reuchlin. Demetrios Chalcondyles published the edition princeps of Homer, Isocrates, and Suidas, and a Greek grammar (Erotemata) in the form of question and answer.

See H. Hody, De Crancis illustribus (1742); C. Hopf, Chroniques gréco-romanes (1873); E. Le Grand, Bibliographie hellénique, i. (1885).

CHALDAEA. The expressions "Chaldaea" and "Chaldaeans" are frequently used in the Old Testament as equivalents for "Babylonia" and "Babylonians." Chaldaea was really the name of a country, used in two senses. It was first applied to the extreme southern district, whose ancient capital was the city of Bit Yakin, the chief seat of the renowned Chaldaean rebel Merodach-baladan, who harassed the Assyrian kings Sargon and Sennacherib. It is not as yet possible to fix the exact boundaries of the original home of the Chaldaeans, but it may be regarded as having been the long stretch of alluvial land situated at the then separate mouths of the Tigris and Euphrates, which still combine to flow into the Persian Gulf at the waters of the majestic Shatt el 'Arab.

The name "Chaldaia," however, soon came to have a more extensive application. In the days of the Assyrian king Rammânîrâtí III. (812-783 B.C.), the term mat Kaldû covered practically all Babylonia. Furthermore, Merodach-baladan was called by Sargon II. (722-705 B.C.) "king of the land of the Chaldaeans" and "king of the land of Bit Yakin" after the old capital city, but there is no satisfactory evidence that Merodach-baladan had the right to the title "Babylonian." The racial distinction between the Chaldaeans and the Babylonians proper seems to have existed until a much later date, although it is almost certain that the former were originally a Semitic people. That they differed from the Arabs and Aramaeans is also seen from the distinction made by Sennacherib (705-681 B.C.) between the Chaldaeans and these races. Later, during the period covering the fall of Assyria and the rise of the Neo-Babylonian empire, the term mat Kaldû was not only applied to all Babylonia, but also embraced the territory of certain foreign nations who were later included by Ezekiel (xxiii. 23) under the expression "Chaldaeans."

As already indicated, the Chaldaeans were most probably a Semitic people. It is likely that they first came from Arabia, the supposed original home of the Semitic races, at a very early date along the coast of the Persian Gulf and settled in the neighbourhood of Ur ("Ur of the Chaldees," Gen. xi. 28), whence they began a series of encroachments, partly by warfare and partly by immigration, against the other Semitic Babylonians. These aggressions after many centuries ended in the Chaldaean supremacy of Nabopolassar and his successors (c. 626 fl.), although there is no positive proof that Nabopolassar was
purely Chaldean in blood. The sudden rise of the later Babylonian empire under Nebuchadrezzar, the son of Nabopolassar, must have tended to produce so thorough an amalgamation of the Chaldaeans and Babylonians, who had theretofore been considered as two kindred branches of the same original Semite stock, that in the course of time no perceptible differences existed between them. A similar amalgamation, although in this case of two peoples originally racially distinct, has taken place in modern times between the Manchu Tartars and the Chinese. It is quite evident, for example, from the Semitic character of the Chaldaean king-names, that the language of these Chaldaeans differed in no way from the ordinary Semitic Babylonian idiom which was practically identical with that of Assyria. Consequently, the term “Chaldean” came quite naturally to be used in later days as synonymous with “Babylonian.” When subsequently the Babylonian language went out of use and Aramaic took its place, the latter tongue was wrongly termed “Chaldee” by Jerome, because it was the only language known to him used in Babylonia. This error was followed until a very recent date by many scholars.

The derivation of the name “Chaldean” is extremely uncertain. Peter Jensen has conjectured with slight probability that the Chaldaeans were Semitized Sumerians, i.e. a non-Semitic tribe which by contact with Semitic influences had lost its original character. There seems to be little or no evidence to support this view. Friedrich Delitzsch derived the name “Chaldean” = Kasadim from the non-Semitic KaSdî, who held the supremacy over practically all Babylonia during an extended period (c. 1783-1200 B.C.). This theory seems also to be extremely improbable. It is much more likely that the name “Chaldean” is connected with the Semitic stem kasadu (conquer), in which case Kaldi-Kasdi, with the well-known interchange of l and s, would mean “conquerors.” It is also possible that Kaldi-Kaldu is connected with the proper name Kasdî, who is represented as having been the nephew of Abraham (Gen. xxii. 22). There is no connexion whatever between the Black Sea peoples called “Chaldaeans” by Xenophon (Anab. vii. 25) and the Chaldaeans of Babylonia.

In Daniel, the term “Chaldean” is very commonly employed with the meaning “astrologers, astronomers,” which sense also appears in the classical authors, notably in Herodotus, Strabo and Diodorus. In Daniel i. 4, by the expression “tongue of the Chaldaeans,” the writer evidently meant the language in which the celebrated Babylonian sages on astrology and divination were composed. It is now known that the literary idiom of the Babylonian wise men was the non-Semitic Sumerian; but it is not probable that the late author of Daniel (c. 168 B.C.) was aware of this fact.

The word “Chaldean” is also used in Daniel in two senses. It is applied as elsewhere in the Old Testament as a race-name to the Babylonians (Dan. iii. 8, v. 30, ix. 1); but the expression is used oftener, either as a name for some special class of magicians, or as a term for magicians in general (ix. 1). The transfer of the name of the people to a special class is perhaps to be explained in the following manner. As just shown, “Chaldean” and “Babylonian” had become in later times practically synonymous, but the term “Chaldean” had lived on in the secondary restricted sense of “wise men.” The early Kaldi had seized and held from very ancient times the region of old Sumer, which was the centre of the primitive non-Semitic culture. It seems extremely probable that these Chaldaean Semites were so strongly influenced by the foreign civilization as to adopt it eventually as their own. Then, as the Chaldaeans soon became the dominant people, the priestly caste of that region developed into a Chaldean institution. It is reasonable to conjecture that southern Babylonia, the home of the old culture, supplied Babylon and other ancient cities with priests from the Chaldean, who were correctly called “Chaldaeans.” This name in later times, owing to the racial amalgamation of the Chaldaeans and Babylonians, lost its former national force, and became, as it occurs in Daniel, a distinctive appellation of the Babylonian priestly class. It is, however, possible, though not certain, that the occurrence of the word kauf (priest) in Babylonian, which has no etymological connexion with Kaldî, may have contributed paronomastically towards the popular use of the term “Chaldaeans” for the Babylonian Magi. (See also ASTROLOGY.)

LITERATURE.—Delattre, Les Chaldéens jusqu’a la fond. de l’emp. de Nébouch. (1886); Winckler, Untersuchungen zur alter. Gesch. (1899), pp. 49 ff.; Gesch. Bab. u. Assyri. (1892), pp. 111 ff.; Prince, Comparative Study of Daniel i. 3-64, 59-61; see also BABYLONIAN AND ASSYRIAN AND SUMER AND SUMERIAN. (J. D. PR.)

CHALDEE, a term sometimes applied to the Aramaic portions of the biblical books of Ezra and Daniel or to the vernacular paraphrases of the Old Testament (see TARGUM). The explanation formerly adopted and embodied in the name Chaldee is that the change took place in Babylon. That the so-called Biblical Chaldee, in which considerable portions of the books of Ezra and Daniel are written, was really the language of Babylon was supposed to be clear from Dan. ii. 4, where the Chaldaeans are said to have spoken to the king in Aramaic. But the cuneiform inscriptions show that the language of the Chaldaeans was Assyrian; and an examination of the very large part of the Hebrew Old Testament written later than the exile proves conclusively that the substitution of Aramaic for Hebrew as the vernacular of Palestine took place very gradually. Hence scholars are now agreed that the term “Chaldee” is a misnomer, and that the dialect so called is really the language of the South-Western Arameans, who were the immediate neighbours of the Jews (W. Wright, Comparative Grammar of the Semitic Languages, p. 376). (See SEMITIC LANGUAGE.)

CHALICER (through a ch. O. Fr. form of the Lat. calix, calice, cup), a drinking-vessel of the cup or goblet form, now only used of the cup used in the celebration of the Eucharist (q.v.). For the various forms which the “chalice” so used has taken, see DRINKING-VESSELS AND FLATE. When, in the eucharistic service, water is mixed with the wine, the “chalice” is known as the “mixed chalice.” This has been customary both in the Eastern and Western Churches from early times. The Armenian Church does not use the “mixed chalice.” It was used in the English Church before the Reformaion. According to the present law of the English Church, the mixing of the water with wine is lawful, if this is not done as part of or during the services, i.e. if it is not done ceremonially (Martin v. Mackenochi, 1868, L.R. 2 P.C. 365; Read v. Bp. of Lincoln, 1862, A.C. 664).

CHALIER, JOSEPH (1747–1793), French Revolutionist. He was destined by his family for the church, but entered business, and became a partner in a firm at Lyons for which he travelled in the Levant, in Italy, Spain and Portugal. He was in Paris in 1789, and entered into relations with Marat, Camille Desmoulins and Robespierre. On his return to Lyons, Chalier was the first to be named member of the municipal bureau. He organized the national guard, applied the civil constitution of the clergy, and regulated the finances of the city so as to tax the rich heavily and spare the poor. Denounced to the Legislative Assembly by the directory of the department of Rhône-et-Loire for having made a nocturnal domiciliary perquisition, he was sent to the bar of the Assembly, which approved of his conduct. In the election for mayor of Lyons, in November 1792, he was defeated by a Royalist. Then Chalier became the orator and leader of the Jacobins of Lyons, and induced the other revolutionary clubs and the commune of his city to arrest a great number of Royalists in the night of the 5th and 6th of February 1793. The mayor, supported by the national guard, opposed this project. Chalier demanded of the Convention the establishment of a revolutionary tribunal and the levy of a revolutionary army at Lyons. The Convention refused, and the anti-revolutionary party, encouraged by this refusal, took action. On the 20th and 30th of May 1793 the sections rose; the Jacobins were dispossessed of the municipality and Chalier arrested. On the 15th of July, in spite of the order of the Convention, he was brought before the criminal tribunal of the Rhône-et-Loire, condemned to death, and guillotined the next day. The Terror paid a veritable worship to his memory, as a to a martyr of Liberty. See N. Wahl, “Étuade sur Chalier,” in Revue historique, t. xxxiv.; and Les Premières Années de la Révolution à Lyon (Paris, 1894).
Since Prof. Barrois introduced the zonal system of subdivision (C. Evans had used a similar scheme six years earlier), our knowledge of the English chalk has been greatly increased by the work of Jukes-Browne and William Hill, and particularly by the laborious studies of Dr A. W. Rowe. Instead of employing the mixed assemblage of animals indicated as zone fossils in the table, A. de Grossouvre proposed a scheme for the north of France based upon ammonite faunas alone, which he contended would be of more general applicability (Recherches sur la Craie Supérieure, Paris, 1901).

The Upper Chalk has a maximum thickness in England of about 1000 ft., but post-cretaceous erosion has removed much of it in many districts. It is more constant in character, and more typically chalky than the lower stages; flints are abundant, and harder nodular beds are limited to the lower portions, where some of the compact limestones are known as “chalk rock.” The thickness of the Middle Chalk varies from about 100 to 240 ft.; flints become scarcer in descending from the upper to the lower portions. The whole is more compact than the upper stage, and nodular layers are more frequent—the “chalk rock” of Dorset and the Isle of Wight belong to this stage. At the base is the “Melbourne rock.” The thickness of the Lower Chalk in England varies from 60 to 240 ft. This stage includes part of the “white chalk without flints,” the “chalk marl,” and the “grey chalk.” The Totternhoe stone is a hard freestone found locally in this stage. The basement bed in Norfolk is a pure limestone, but very frequently it is marly with grains of sand and glauconite, and often contains phosphatic nodules; this facies is equivalent to the “Cambridge Greensand” of some districts and the “chloritic marl” of others. In Devonshire the Lower Chalk has become thin sandy calcareous series.

The chalk can be traced in England from Flamborough Head in Yorkshire, in a south-westerly direction, to the coast of Dorset; and it not only underlies the whole of the S.E. corner, where it is often obscured by Tertiary deposits, but it can be followed across the Channel into northern France. Rocks of the same age as the chalk are widespread (see CRETAEUS SYSTEM); but the variety of limestone properly called by this name is almost confined to the Anglo-Parian basin. Some chalk occurs in the great Cretaceous deposits of Russia, and in Kansas, Iowa, Nebraska and S. Dakota in the United States. Hard white chalk occurs in Ireland in Antrim, and on the opposite shore of Scotland in Mull and Morven.

Economic Products of the Chalk.—Common chalk has been frequently used for rough building purposes, but the more important building stones are: “Beau screen,” from Beer Head in Devonshire, “Spa stone,” from Spa in Belgium, and “Totternhoe stone.” It is burnt for lime, and when mixed with some form of clay is used for the manufacture of cement; chalk marl has been used alone for this purpose. As a manure, it has been much used as a dressing for clayey land. Flints from the chalk are used for road metal and concrete, and have been employed in building as a facing for walls. Phosphatic nodules for manure have been worked from the chloritic marl and Cambridge Greensand, and to some extent from the Middle Chalk. The same material is worked at Ciply in Belgium and Picardy in France. Chalk is employed in the manufacture of carbonate of soda, in the preparation of carbon dioxide, and in many other chemical processes; also for making paints, crayons and tooth-powder. Whiting or Spanish white, used to polish glass and metal, is purified chalk prepared by triturating common chalk with a large quantity of water; which is then decanted and allowed to deposit the finely-divided particles it holds in suspension.

Chalk Scenery.—Where exposed at the surface, chalk produces rounded, smooth,
grass-covered hills as in the Downs of southern England and the Wolds of Yorkshire and Lincolnshire. The hills are often intersected by clean-cut dry valleys. It forms fine cliffs on the coast of Kent, Yorkshire and Devonshire.

Chalk is employed medicinally as a very mild astringent either alone or more usually with other astringents. It is more often used, however, for a purely mechanical action, as in the preparation of hydragrum cum creta. As an antacid its use has been replaced by other drugs.

Black chalk or drawing slate is a soft carbonaceous schist, which gives a black streak, so that it can be used for drawing or writing. Brown chalk is a kind ofumber. Red chalk or reddle is an impure earthy variety of haematite. French chalk is a soft variety of steatite, a hydrated magnesium silicate.

CHALKHILL, JOHN (fl. 1606?), English poet. Two songs by him are included in Izaak Walton's Compleat Angler, and in 1683 appeared "Thealm and Clearchus. A Pastoral History in smooth and easie Verse. Written long since by John Chalkhill, Esq., an Acquaintant and Friend of Edmund Spencer " (1683), with a preface written five years earlier by Walton. Another poem, "Alclia, Philoparnths Loveing Follie" (1595), reprinted in vol. x. of the Jahrbuch des deutschen Shakespeare-Vereins, was at one time attributed to him. Nothing further is known of the poet, but a person of his name occurs as one of the coroners for Middlesex in the later years of Queen Elizabeth's reign. Professor Saintsbury, who included Thealma and Clearchus in vol. ii. of his Minor Poets of the Caroline Period (Oxford, 1900), points out a marked resemblance between his work and that of William Chamberlayne.

CHALKING THE DOOR, a Scottish custom of landlord and tenant law. In former days the law was that "a burgh officer, in presence of witnesses, chalks the most patent door forty days before Whitsunday, having made out an execution of 'chalking,' in which his name must be inserted, and which must be subscribed by himself and two witnesses." This ceremony now proceeds simply on the verbal order of the proprietor. The execution of chalking is a warrant under which decree of removal will be pronounced by the burgh court, in virtue of which the tenant may be ejected on the expiration of a charge of six days.

CHALLEML-LACOUR, JEAN BAPTISTE MARIUS AUGUSTIN (1818-1894), French historian, was born in Paris on the 18th of March 1818. His writings consist chiefly of popular works, which enjoyed great success. The value of some of his books is enhanced by numerous illustrations, e.g. Histoire-musée de la Révolution française, which appeared in 50 numbers in 1841-1842 (3rd ed., in 72 numbers, 1857-1858); Histoire de la mode en France; la toilette des femmes depuis l'époque gallo-romaine jusqu'à nos jours (1847, with 12 plates; new ed., 1880, with 21 coloured plates). Histoires du peuple français (1859-1861, 1870-1876). Les feux des héroïnes: l'histoire de l'AF (1881) have at least have the merit of being among the first books written on the social history of France. In this sense Challemel was a pioneer, of no great originality, it is true, but at any rate of fairly wide information. He died on the 20th of October 1894.

CHALLEML-LACOUR, PAUL AMAND (1827-1896), French statesman, was born at Avanches on the 19th of May 1827. After passing through the École Normale Supérieure he became professor of philosophy successively at Pau and at Limoges. The coup d'état of 1851 caused his expulsion from France for his republican opinions. He travelled on the continent, and in 1856 settled down as professor of French literature at the Polytechnic of Zürich. The amnesty of 1859 enabled him to return to France, but a projected course of lectures on history and art was immediately suppressed. He now supported himself by his pen, and became a regular contributor to the reviews. On the fall of the Second Empire in September 1870 the government of national defence appointed him prefect of the department of the Rhone, in which capacity he had to suppress the Communist rising at Lyons. Resigning his post on the 7th of February 1871, he was in January 1872 elected to the National Assembly, and in 1876 to the Senate. He sat at first on the Extreme Left; but his philosophic and critical temperament was not in harmony with the recklessness of French radicalism, and his attitude towards political questions underwent a steady modification, till the close of his life saw him the foremost representative of moderate republicanism. During Gambetta's lifetime, however, Challemel-Lacour was one of his warmest supporters, and he was for a time editor of Gambetta's organ, the République française. In 1879 he was appointed French ambassador at Bern, and in 1880 was transferred to London; but he lacked the suppleness and command of temper necessary to a successful diplomatist. He resigned in 1882, and in February 1883 became minister of foreign affairs in the Jules Ferry cabinet, but retired in November of the same year. In 1890 he was elected vice-president of the Senate, and in 1893 succeeded Jules Ferry as its president. His influence, however, that body was largely due to his clear and reasoned eloquence, which placed him above French orators. In 1893 he also became a member of the French Academy. He distinguished himself by the vigour with which he upheld the Senate against the encroachments of the chamber, but in 1895 falling health forced him to resign, and he died in Paris on the 26th of October 1896. He published a translation of A. Heinrich Ritter's Geschichte der Philosophie (1861); La Philosophie individualiste: étude sur Guillaume de Humboldt (1864); and an edition of the works of Madame d'Épinay (1866).

CHALLENGE (O. Fr. chalenge, calenge, kce, from Lat. columna, originally meaning trickery, from calvis, to deceive, hence a false accusation, a "calumni,") originally a charge against a person or a claim to anything, a defiance. The term is now particularly used of an invitation to a trial of skill in any contest, or to a trial by combat as a vindication of personal honour (see Duel), and, in law, of the objection to the members of a jury allowed in a civil action or in a criminal trial (see Jury).

"CHALLENGER" EXPEDITION. The scientific results of several short expeditions between 1860 and 1870 encouraged the council of the Royal Society to approach the British government, of the suggestion of Sir George Richards, hydrographer to the admiralty, with a view to commissioning a vessel for a prolonged cruise for ocean exploration. The government detailed H.M.S. "Challenger," a wooden corvette of 2306 tons, for the purpose. Captain (afterwards Sir) George Nares was placed in command, with a naval crew; and a scientific staff was selected by the society with Professor (afterwards Sir) C. Wyville Thomson as director. The staff included Mr. Sir John Murray and Mr. H. N. Moseley, biologists; Dr von Willemoes-Suhm, Commander Tizard, and Mr. J. Y. Buchanan, chemist and geologist. A complete scheme of instructions was drawn up by the society. The "Challenger" sailed from Portsmouth in December 1872. For nearly a year the work of the expedition was carried on in the Channel and in the North Sea. The conclusion of the voyage was the exploration of Teneriffe, the Bermudas, the Azores, Madeira, the Cape Verde Islands, Bahia and Tristan da Cunha were successively visited, and in October 1873 the ship reached Cape Town. Steering then south-east and east she visited the various islands between 45° and 50° S., and reached Kerguelen Island in January 1874. She next proceeded southward towards the meridian of 80° E. She was the first steamship to cross the Antarctic circle, but the attainment of a high southerly latitude was not an object of the voyage, and early in March the ship left the south polar regions and made for Melbourne. Extensive researches were now made in the Pacific. The route led by New Zealand, the Fiji Islands, Torres Strait, the Banda Sea, and the China Sea to Hong Kong. The Western Pacific was then explored northward to Yokohama, after which the "Challenger" struck across the ocean by Honolulu and Tahiti to Valparaiso. She then coasted...
southward, penetrated the Straits of Magellan, touched at Montevideo, recrossed the Atlantic by Ascension and the Azores, and reached Sheerness in May 1876. This voyage is without parallel in the history of scientific exploration. The "Challenger" Report was issued in fifty volumes (London, 1880–1895), mainly under the direction of Sir John Murray, who succeeded Wyville Thomson in this work in 1882. Specialists in every branch of science assisted in its production. The zoological collections alone formed the basis for the majority of the volumes; the deep-sea soundings and samples of the deposits, the chemical analysis of water samples, the meteorological, water-temperature, magnetic, geological, and botanical observations were fully worked out, and a summary of the scientific results, narrative of the cruise and indices were also provided.

See also Lord G. Campbell, Log Letters of the "Challenger," (1876); W. J. J. Spry, Cruise of H.M.S. "Challenger" (1876); Sir C. Wyville Thomson, Voyage of the "Challenger." The Atlantic, Preliminary Account of General Results (1877); J. J. Wild, At Anchor; Narrative of Experiences afoot and ashore during the Voyage of H.M.S. "Challenger." (1878); H. N. Moseley, Notes by a Naturalist on the "Challenger." (1879).

CHALLONER, RICHARD (1601–1781), English Roman Catholic prelate, was born at Lewes, Sussex, on the 29th of September 1601. After the death of his first wife, he married his second, Elizabeth (Dopy), who was a Frenchwoman. He lived with some Roman Catholic families. Thus it came about that he was brought up as a Roman Catholic, chiefly at the seat of Mr Holman at Warkworth, Northamptonshire, where the Rev. John Gothe, a celebrated controversialist, officiated as chaplain. In 1704 he was sent to the English College at Douai, where he was ordained a priest in 1716, took his degrees in divinity, and was appointed professor in that faculty. In 1730 he was sent on the English mission and stationed in London. The controversial treatises which he published in rapid succession attracted much attention, particularly his Catholic Christian Instructed (1737), which was prefixed by a witty reply to Dr Conyers Middleton's Letters from Rome, showing an Exact Conformity between Popery and Paganism. Middleton is said to have been so irritated that he endeavoured to put the penal laws in force against his antagonist, who prudently withdrew from London. In 1741 Challoner was raised to the episcopal dignity at Hammersmith, and nominated coadjutor with right of succession to Bishop Benjamin Petre, vicar-apostolic of the northern provinces. He was consecrated in 1742. He resided principally in London, but was obliged to retire into the country during the "No Popery" riots of 1780. He died on the 12th of January 1781, and was buried at Milton, Berkshire. Bishop Challoner was the author of numerous controversial and devotional works, which have been frequently reprinted and translated into various languages. He compiled the Garden of the Soul (1740?), which continues to be the most popular manual of devotion among English-speaking Roman Catholics, and he revised an edition of the Douai version of the Scriptures (1740–1750), correcting the language and orthography, which in many places had become obsolete. Of his historical works the most valuable is one which was intended to be a Roman Catholic antidote to Foe's well-known martyrology. It is entitled Memoirs of Missionary Priests and other Catholics of both Sexes who suffered Death or Imprisonment in England on account of their Religion, from the year 1577 till the end of the reign of Charles II. (2 vols. 1741, frequently reprinted). He also published anonymously, in 1745, the lives of English, Scotch and Irish saints, under the title of Brioch's Historical Work which has, however, been superseded by that of Alban Butler.

For a complete list of his writings see J. Gillow's Bibl. Dict. of Eng. Cat., 452–458; Barnard, Life of R. Challoner (1794); Flanagan, History of the Catholic Church in England (1857); there is also a critical history of Challoner by Rev. E. Burton.

CHALMERS, ALFRED (1759–1834), Scottish writer, was born in Aberdeen on the 20th of March 1759. He was educated as a doctor, but gave up this profession for journalism, and he was for some time editor of the Morning Herald. Besides editions of the works of Shakespeare, Beattie, Fielding, Johnson, Warton, Pope, Gibbon, Bolingbroke, he published A General Biographical Dictionary in 32 vols. (1812–1817); A Glossary to Shakespeare (1797); an edition of Steevens's Shakespeare (1809); and the British Essayists, beginning with the Tiller and ending with the Observer, with biographical and historical prefaces and a general index. He died in London on the 10th of December 1834.

CHALMERS, GEORGE (1742–1825), Scottish antiquarian and political writer, was born at Fochabers, a village in the county of Moray, in 1742. His father, James Chalmers, was a grandson of George Chalmers of Pittensear, a small estate in the parish of Lhanbryde, now St Andrews-Lhanbryde, in the same county, possessed by the main line of the family from about the beginning of the 17th to the middle of the 18th century. After completing the usual course at King's College, Aberdeen, young Chalmers studied law in Edinburgh for several years. Two uncles on the father's side having settled in America, he visited Maryland in 1763, with the view, it is said, of assisting to recover a tract of land of some extent about which a dispute had arisen, and was in this way induced to commence practice as a lawyer at Baltimore, where for a time he met with much success. Having, however, espoused the cause of the Royalists during the taking out of the Government of the New World, he found it expedient to abandon his professional prospects in the New World, and return to his native country. For the losses he had sustained as a colonist he received no compensation, and several years elapsed before he obtained an appointment that placed him in a state of comfort and independence.

In the meantime Chalmers applied himself with great diligence and assiduity to the investigation of the history and establishment of the English colonies in North America; and enjoying free access to the state papers and other documents preserved among what were then termed the plantation records, he became possessed of much important information. His work entitled Political Annals of the present United Colonies from their Settlement to the Peace of 1763, 4to, London, 1780, was to have formed two volumes; but the second, which should have contained the period between 1688 and 1763, never appeared. The first volume, however, is complete in itself, and traces the original settlement of the different American colonies, and the progressive changes in their constitutions and mode of government as affected by the state of the mother country, and the progress of the colonies. In addition to its value as being compiled from original documents, it bears evidence of great research, and has been of essential benefit to later writers. Continuing his researches, he next gave to the world An Estimate of the Comparative Strength of Britain during the Present and Four Preceding Reigns, London, 1792, which passed through several editions. At length, in August 1786, Chalmers, whose sufferings as a Royalist must have strongly recommended him to the government of the day, was appointed chief clerk to the committee of privy council on matters relating to trade, a situation which he retained till his death in 1825, a period of nearly forty years. As his official duties made no great demands on his time, he had abundant leisure to devote to his favourite studies,—the antiquities and topography of Scotland having thenceforth special attractions for his busy pen.

Besides biographical sketches of Defoe, Sir John Davies, Allan Ramsay, Sir David Lyndsay, Churchyard and others, prefixed to editions of their respective works, Chalmers wrote a life of Thomas Paine, the author of the Rights of Man, which he published from the original name of Evans Oldys, A.M., of the University of Pennsylvania; and a life of Ruddiman, in which considerable light is thrown on the state of literature in Scotland during the earlier part of the last century. His life of Mary Queen of Scots, in two 4to vols., was first published in 1818. It is founded on a MS. left by John Whittaker, the historian of Manchester; but Chalmers informs us that he found it necessary to rewrite the whole. The history of that ill-fated queen occupied much of his attention, and his last work, A Detection of the Love-Letters lately attributed in Hugh Campbell's work to Mary Queen of Scots, is an exposure of an attempt to represent as genuine some fictitious letters said to have passed between Mary and Bothwell.
which had fallen into deserved oblivion. In 1797 appeared his 
Apology for the Believers in the Shakespeare Papers which were 
exhibited in Norfolk Street, followed by other tracts on the same 
subject. These contributions to the literature of Shakespeare are 
full of curious matter, but on the whole display a great waste of 
erudition, in seeking to show that papers which had been proved 
forgeries might nevertheless have been genuine. Chalmers also 
took part in the Junius controversy, and in The Author of Junius 
Ascertained, from a Concatenation of Circumstances amounting 
to Moral Demonstration, Lond. 1817, 8vo, sought to fix the author-
ship of the celebrated letters on Hugh Boyd. In 1824 he published 
The Poetical Remains of some of the Scottish Kings, now first 
collected; and in the same year he edited and presented as a 
contribution to the Bannatyne Club Robene and Makyne and the 
Testament of Cresseid, by Robert Henryson. His political writings 
are equally numerous. Among them may be mentioned Collection 
of Treatises between Great Britain and other Powers, Lond. 
1799, 2 vols. 8vo; Indication of the Privileges of the People in 
respect to the Constitutional Right of Free Discussion, &c., Lond. 
1796, 8vo, published anonymously; A Chronological Account of 
Commerce and Coinage in Great Britain from the Restoration till 
the Present Time, Edinburgh; and Emblems illustrated on various 
points of English Jurisprudence, chiefly concerning the Colonies, 
Fisheries, and Commerce of Great Britain, Lond. 1814, 2 vols. 8vo; 
Comparative Views of the State of Great Britain before and 
since the War, Lond. 1817, 8vo.

But Chalmers's greatest work is his Caledonia, which, however, 
he did not live to complete. The first volume appeared in 1807, 
and is introductory to the others. It is divided into four books, 
treating successively of the Roman, the Pictish, the Scottish 
and the Scoto-Saxon periods, from 80 to 1306 a.d. In these we are 
presented, in a condensed form, with an account of the people, 
the language and the civil and ecclesiastical history, as well as 
the agricultural and commercial state of Scotland during the 
first thirteen centuries of our era. Unfortunately the chapters 
prepared on the Roman period are entirely marred by the author's having 
accepted as genuine Bertram's forgery De Situ Britanniae; 
but otherwise his opinions on controverted topics are worthy 
of much respect, being founded on a laborious investigation of all 
the original authorities that were accessible to him. The second 
volume, published in 1810, gives an account of the seven 
south-eastern counties of Scotland— Roxburgh, Berwick, Haddington, 
Edinburgh, Linlithgow, Peebles and Selkirk—each of them being 
treated of as regards name, situation and extent, natural objects, 
 antiquities, establishment as shires, civil history, agriculture, 
manufactures and trade, and ecclesiastical history. In 1824, 
after an interval of fourteen years, the third volume appeared, 
giving, under the same headings, a description of the seven 
south-western counties—Dumfries, Kirkcudbright, Wigtown, 
Ayr, Lanark, Renfrew and Dumbarton. In the preface to this 
volume the author states that the materials for the history of the 
central and northern counties were collected, and that he 
expected the work would be completed in two years, but this 
expectation was not destined to be realized. He had also prepared for 
the press an elaborate history of the life and reign of David I. 
In his later researches he was assisted by his nephew James, son of 
Alexander Chalmers, writer in Elgin.

George Chalmers died in London on the 31st of May 1825. 
His valuable and extensive library he bequeathed to his nephew, 
at whose death in 1841 it was sold and dispersed. Chalmers was 
a member of the Royal and Antiquarian Societies of London, an 
 honorary member of the Antiquarian Society of Scotland, and 
a member of other learned societies. In private life he was 
undoubtedly an amiable man, although the dogmatic tone that 
disguises portions of his writings procured him many opponents. 
Among his avowed antagonists in literary warfare the most 
distinguished were Malone and Steevens, the Shakespeare editors; 
Mathias, the author of the Pursuits of Literature; Dr Jameson, 
the Scottish lexicographer; Pinkerton, the historian; Dr Irving, 
the biographer of the Scottish poets; and Dr Currie of Liverpool. 
But with all his failings in judgment Chalmers was a valuable 
writer. He uniformly had recourse to original sources of 
information; and he is entitled to great praise for his patriotic 
and self-sacrificing endeavours to illustrate the history, literature 
and antiquities of his native country.

CHALMERS, GEORGE PAUL (1836-1878), Scottish painter, 
was born at Montrose, and studied at Edinburgh. His land-
scapes are now more valued than the portraits which formed his 
earlier work. The best of these are "The End of the Harvest" 
(1873), "Running Water" (1873), and "The Legend" (in the 
National Gallery, Edinburgh). He became an associate (1867) 
and a full member (1871) of the Scottish Academy.

CHALMERS, JAMES (1841-1901), Scottish missionary to 
New Guinea, was born at Ardrossan in Ayr. After serving 
in the Glasgow City Mission he passed through Cheshunt College, 
and, being accepted by the London Missionary Society, was 
appointed to Raratonga in the South Pacific in 1866. Here the 
natives gave him the well-known name "Tatame." After 
two years' service, especially in training native evangelists, he was 
transferred to New Guinea, and his remaining five years of 
missionary work, Chalmers did much to open up the island, 
and, with his colleague W. G. Lawes, gave valuable aid in 
the British annexation of the south-east coast of the island. 
On the 8th of April 1901, in company with a brother missionary, 
Oliver Tomkins, he was killed by cannibals at Goaribari Island. 
R. L. Stevenson has left on record his high appreciation 
of Chalmers's character and work.

Chalmers's Autobiography and Letters were edited by Richard 
Lovett in 1902, who also wrote a popular life called Tatame.

CHALMERS, THOMAS (1780-1847), Scottish divine, was born 
at Anstruther in Fife, on the 17th of March 1780. At the 
age of eleven he was entered as a student at St Andrews, where he 
devoted himself almost exclusively to mathematics. In January 
1799 he was licensed as a preacher of the Gospel by the St 
Andrews presbytery. In May 1803, after attending further 
courses of lectures in Edinburgh, and acting as assistant to the 
professor of mathematics at St Andrews, he was ordained as 
minister of Kilmany in Fifeshire, about 9 m. from the university 
town, where he continued to lecture. His name roused so much 
enthusiasm that they were discontinued by order of 
the authorities, who disliked the disturbance of the university 
routine which they involved. Chalmers then opened mathematical 
classes on his own account which attracted many students; 
at the same time he delivered a course of lectures on chemistry, 
and ministered to his parish at Kilmany. In 1805 he became 
a candidate for the vacant professorship of mathematics at 
Edinburgh, but was unsuccessful. In 1808 he published an 
Inquiry into the Extent and Stability of National Resources, a 
contribution to the discussion created by Bonaparte's commercial 
policy. Domestic bereavements and a severe illness then turned 
his thoughts in another direction. At his own request the article 
on Christianity was assigned to him in Dr Brewster's Edinburgh 
Encyclopaedia, and in studying the credentials of Christianity he 
received a new impression of its contents. His journal and letters 
show how he was led from a sustained effort to attain the morality 
of the Gospel to a passion for spiritual revolution. After this his 
ministry was marked by a zeal which made it famous. The 
separate publication of his article in the Edinburgh Encyclo-
opaedia, and contributions to the Edinburgh Christian Instructor 
and the Eclectic Review, enhanced his reputation as an author. 
In 1815 he became minister of the Tron Church, Glasgow, in 
spite of determined opposition to him in the town council on the 
ground of his evangelical teaching. From Glasgow his repute 
as a preacher spread throughout the United Kingdom. A 
series of sermons on the relation between the discoveries 
of astronomy and the Christian revelation was published in January 
1817, and within a year nine editions and 20,000 copies were 
in circulation. When he visited London Wilberforce wrote, "all 
the world is wild about Dr Chalmers."

In Glasgow Chalmers made one of his greatest contributions
to the life of his own time by his experiments in parochial organization. His parish contained about 10,000 persons, and of these about one-third were unconnected with any church. He diagnosed this evil as being due to the absence of personal influence, spiritual oversight, and the want of parochial organizations which had not kept pace with the growing population. He declared that twenty new churches, with parishes, should be erected in Glasgow, and he set to work to revivify, remodel and extend the old parochial economy of Scotland. The town council consented to build one new church, attaching to it a parish of 10,000 persons, mostly weavers, labourers and factory workers, and this church was offered to Dr Chalmers that he might have a fair opportunity of testing his system.

In September 1819 he became minister of the church and parish of St John, where of 2000 families more than 800 had no connexion with any Christian church. He first addressed himself to providing schools for the children. Two school-houses with four endowed teachers were established, where 700 children were taught at the moderate fees of 2s. and 3s. per quarter. Between 40 and 50 local Sabbath schools were opened, where more than 1000 children were taught the elements of secular and religious education. The parish was divided into 25 districts embracing from 60 to 100 families, over each of which an elder and a deacon were placed, the former taking oversight of their spiritual, the latter of their physical needs. Chalmers was the mainspring of the whole system, not merely superintending the visits personally visiting all the families, and holding evening meetings, when he addressed those whom he had visited. This parochial machinery enabled him to make a singularly successful experiment in dealing with the problem of poverty. At this time there were not more than 20 parishes north of the Firth and Clyde where there was a compulsory assessment for the poor, but the English method of assessment was rapidly spreading. Chalmers believed that compulsory assessment ended by swelling the evil it was intended to mitigate, and that relief should be raised and administered by voluntary means. His critics replied that this was impossible in large cities. When he undertook the management of the parish of St John’s, the poor of the parish cost the city £1400 per annum, and in four years, by the adoption of his method, the pauper expenditure was reduced to £280 per annum. The investigation of all new applications for relief was committed to the deacon of the district, and every effort was made to enable the poor to help themselves. When once the system was in operation it was found that a deacon, by spending an hour a week among the families committed to his charge, could keep himself acquainted with their character and condition.

In 1823, after eight years of work at high pressure, he was glad to accept the chair of moral philosophy at St Andrews, the seventh academic offer made to him during his eight years in Glasgow. In his lectures he excluded mental philosophy and included the whole sphere of moral obligation, dealing with man’s duty to God and to his fellow-men in the light of Christian teaching. Many of his lectures are printed in the first and second volumes of his published works. In ethics he made contributions to the science in regard to the place and functions of volition and attention, the separate and undivided character of the moral sentiments, and the distinction between the virtues of perfect and imperfect obligation. His lectures kindled the religious spirit among his students, and led some of them to devote themselves to missionary effort. In November 1828 he was transferred to the chair of theology in Edinburgh. He then introduced the practice of following the lecture in Edinburgh with a viva voce examination on what had been delivered. He also introduced text-books, and came into stimulating contact with his people; perhaps no one has ever succeeded as he did by the use of these methods in communicating intellectual, moral and religious impulse to so many students.

These academic years were prolific also in a literature of various kinds. In 1826 he published a third volume of the Christian and Civic Economy of Large Towns, a continuation of work begun at St John’s, Glasgow. In 1832 he published a Political Economy, the chief purpose of which was to enforce the truth that the right economic condition of the masses of mankind is their moral and intellectual condition, that character is the parent of comfort, not vice versa. In 1833 appeared a treatise on The Adaptation of External Nature to the Moral and Intellectual Constitution of Man. In 1834 Dr Chalmers was elected fellow of the Royal Society of Edinburgh, and in the same year he became corresponding member of the Institute of France; in 1835 Oxford conferred on him the degree of D.C.L. In 1834 he became leader of the evangelical section of the Scottish Church in the General Assembly. He was appointed chairman of a committee for church extension, and in that capacity made a tour through a large part of Scotland, addressing presbyteries and holding public meetings. He also issued numerous appeals, with the result that in 1841, when he resigned his office as convener of the church extension committee, he was able to announce that in seven years upwards of £300,000 had been contributed, and 220 new churches had been built. His efforts to induce the Whig government to assist in this effort were unsuccessful.

In 1841 the movement which ended in the Disruption was rapidly culminating, and Dr Chalmers found himself at the head of the party which stood for the principle that “no minister shall be intruded into any parish contrary to the will of the congregation.” (See FREE CHURCH OF SCOTLAND). Cases of conflict between the church and the civil power arose in Auchterarder, Dunkeld and Marnoch; and when the courts made it clear that the church, in their opinion, had kept its temporariness on condition of rendering such obedience as the courts required, the church appealed to the government for relief. In January 1843 the government put a final and peremptory negative on the church’s claims for spiritual independence. On the 18th of May 1843 470 clergyman withdrew from the general assembly and constituted themselves the Free Church of Scotland, with Dr Chalmers as moderator. He had prepared a sustentation fund scheme for the support of the seceding ministers, and this was at once put into successful operation. On the 30th of May 1847, immediately after his return from the House of Commons, where he had given evidence as to the refusal of sites for Free Churches by Scottish landowners, he was found dead in bed.

Dr Chalmers’ action throughout the Free Church controversy was so consistent in its application of Christian principle and so free from personal or party animus, that his writings are a valuable source for argument and illustration on the question of Establishment. “I have no veneration,” he said to the royal commissioners in St Andrews, before either the voluntary or the non-intrusive establishment, and added for the Church of Scotland qua an establishment, but I have the utmost veneration for it qua an instrument of Christian good.” He was transparent in character, chivalrous, kindly, firm, eloquent and sagacious; his purity of motive and unselfishness commanded absolute confidence; he had originality and initiative in dealing with new and difficult circumstances, and great aptitude for business details.

During a life of incessant activity Chalmers scarcely ever allowed a day to pass without its modicum of composition; at the most unseasonable times, and in the most unlikely places, he would occupy himself with literary work. His writings occupy more than 30 volumes. He would have stood higher as an author had he written less, or had he indulged less in that practice of reiteration into which he was constantly betrayed by his anxiety to impress his ideas upon others. As a political economist he was the first to unfold the connexion that subsists between the degree of the fertility of the soil and the social condition of a community, the rapid manner in which capital is reproduced (see Mill’s Political Economy, i. 94), and the general doctrine of a limit to all the modes by which national wealth may accumulate. He was the first also to advance that argument in favour of religious establishments which meets upon its own ground the doctrine of Adam Smith, that religion like other things should be left to the operation of the natural law of supply and demand. In the department of natural theology and the Christian evidences he ably advocated that
method of reconciling the Mosaic narrative with the indefinite antiquity of the globe which William Buckland (1784–1856) advanced in his Bridgewater Treatise, and which Dr Chalmers had previously communicated to him. His refutation of Hume’s objection to the truth of miracles is perhaps his intellectual chef-d’œuvre. The distinction between the laws and dispensations of nature, as between the ethics and objects of theology, he was the first to indicate and enforce, and he laid great emphasis on the superior authority as witnesses for the truth of Revelation of the Scriptural as compared with the Extra-Scriptural writers, and of the Christian as compared with the non-Christian testimonies. In his Institutes of Theology, no material modification is attempted on the doctrines of Calvinism, which he received with all simplicity of faith as revealed in the Divine word, and defended as in harmony with the most profound philosophy of human nature and of the Divine providence.

For biographical details see Dr W. Hanna’s Memoirs (Edinburgh, 4 vols., 1849–1852); there is a good short Life by Mrs Oliphant (1853).

CHALONER, SIR THOMAS (1521–1568), English statesman and poet, was the son of Roger Chaloner, mercer of London, a descendant of the Denbighshire Chaloners. No details are known of his youth except that he was educated at both Oxford and Cambridge. In 1540 he went, as secretary to Sir Henry Knyvett, to the court of Charles V., whom he accompanied in his expedition against Algiers in 1541, and was wrecked on the Barbary coast. In 1547 he joined in the expedition to Scotland, and was knighted, after the battle of Musselburgh, by the protector Somerset, whose patronage he enjoyed. In 1549 he was a witness against Dr Bonner, bishop of London, in 1551 against Stephen Gardiner, bishop of Winchester; in the spring of the latter year he was sent as a commissioner to Scotland, and again in March 1552. In 1553 he went with Sir Nicholas Wotton and Sir William Pickering on an embassy to France, but was recalled by Queen Mary on her accession. In spite of his Protestant views, Chaloner was still employed by the government, going to Scotland in 1555–1556, and providing carriages for troops in the war with France, 1557–1558. In 1558 he went as Elizabeth’s ambassador to the emperor Ferdinand at Cambrai, from July 1559 to February 1559/60 he was ambassador to King Philip at Brussels, and in 1561 he went in the same capacity to Spain. He was full of complaints of his treatment there, but it was not till 1564, when in failing health, that he was allowed to return home. He died at his house in Clerkenwell on the 14th of October 1565. He acquired during his years of service three estates, Guisborough in Yorkshire, Steep Claydon in Buckinghamshire, and St Bees in Cumberland. He married (1) Joan, widow of Sir Thomas Leigh; and (2) Etheldreda, daughter of Edward Froksham, of Elton, Cheshire, by whom he had one son, Sir Thomas Chaloner (1561–1613), the naturalist. Chaloner was the intimate of most of the learned men of his day, and with Lord Burghley he had a life-long friendship. Throughout his busy official life he occupied himself with literature, his Latin verses and his pastoral poems being much admired by his contemporaries. Chaloner’s ‘Howe the Lorde Mowbray was . . . banished the Realme,’ printed in the 1559 edition of William Baldwin’s Mirror for Magistrates (repr. in vol. ii. pt. 1 of Joseph Haswell’s edition of 1813), has sometimes been attributed to Thomas Churchyard. His most important work, De Rep. Anglorum instauranda libri decem, written while he was in Spain, was first published by William Mallo (1579, 3 pts.), with complimentary Latin verses in praise of the author by Burghley and others. Chaloner’s epigrams and epitaphs were also added to the volume, as well as In libris Horaci octavi Carmen Panegyricum, first printed in 1560. Amongst his other works are The prais of folie. Moriae encomium . . . by Erasmus . . . Englished by Sir Thomas Chaloner, Knight (1549, ed. Janet E. Ashbee, 1901); A book of the Office of Servantes (1543), translated from Gilbert Cognatus; and An hermitage of Saint John Chrysostome . . . Englished by T. C. (1544).

CHALONS-SUR-SAAONE, a town of east-central France, capital of an arrondissement in the department of Saône-et-Loire, capital of the department of Marne, 107 m. E. of Paris on the main line of the Eastern railway to Nancy, and 25 m. S.S.E. of Reims. Pop. (1906) 22,424. Châlons is situated in a wide level plain principally on the right bank of the Marne, a small river of Marne, which contains the railway-stations of the Eastern and Estaf railways, lying on the left bank. The town proper is bordered on the west by the lateral canal of the Marne, across which lies a strip of ground separating it from the river itself. Châlons is traversed by branches of the canal and by small streams, and its streets are for the most part narrow and irregular, but it is surrounded by ample avenues and promenades, the park known as the Jard, in the south-western quarter, being especially attractive. Huge barracks lie to the north and east. There are several churches in the town. The cathedral of St Etienne dates chiefly from the 13th century, but its west façade is in the classical style and belongs to the 17th century. There are stained-glass windows of the 13th century in the north transept. Notre-Dame, of the 12th and 13th centuries, is conspicuous for its four Romanesque towers, two flanking the apse; the other two, surmounted by tall lead spires, flanking the principal façade. The churches of St. Alpin, St Jean and St Loup date from various periods between the 11th and the 17th centuries. The hôtel-de-ville (1771), facing which stands a monument to President Carnot; the prefecture (1759–1764), once the residence of the intendants of Champagne; the college, once a Jesuit establishment; and a training college which occupies the Augustinian abbey of Toussaints (16th and 17th centuries), are noteworthy civil buildings. The houses of Châlons are generally ill-built of timber and plaster, or rough-cast, but some old mansions, dating from the 15th to the 16th centuries, remain.

The church of Ste.Pudentienne, on the left bank of the river, is a well-known place of pilgrimage. The town is the seat of a bishop and a prefect, and headquarters of the VI. army corps; it has tribunals of first instance and of commerce, a chamber of commerce, a board of trade-arbitrators, a museum, a library, training colleges, a higher ecclesiastical seminary, a communal college and an important technical school. The principal industry is brewing, which is carried on in the suburb of Marne. Galleries of immense length, hewn in a limestone hill and served by lines of railways, are used as stores-houses for beer. The preparation of champagne, the manufacture of boots and shoes, brushes, wire-goods and wall-paper also occupy many hands. There is trade in cereals.

Châlons-sur-Marne occupies the site of the chief town of the Castrui, and some portion of the plains which lie between it and Troyes was the scene of the defeat of Attila in the conflict of 451. In the 10th and following centuries it attained great prosperity as a kind of independent state under the supremacy of its bishops, who were ecclesiastical peers of France. In 1214 the militia of Châlons served at the battle of Bouvines; and in the 15th century the citizens maintained their honour by twice (1430 and 1434) repulsing the English from their walls. In the 16th century the town passed into the hands of Francis I., king of France, who in 1589 transferred thither the parliament of Paris, which shortly afterwards burnt the bulls of Gregory XIV. and Clement VIII. In 1856 Napoleon III. established a large camp, known as the Camp of Châlons, about 16 m. north of the town by the railway to Reims. It was situated in the immediate neighbourhood of Grand Mourmelon and Petit Mourmelon, and occupied an area of nearly 30,000 acres. The “Army of Châlons,” formed by Marshal MacMahon in the camp after the first reverses of the French in 1870, marched thence to the Meuse, was surrounded by the Germans at Sedan, and forced to capitulate. The camp is still a training-centre for troops.

About 5 m. E. of Châlons is L’Épine, where there is a beautiful pilgrimage church (15th and 16th centuries, with modern restoration) with a richly-sculptured portal. In the interior there is a fine choir-screen, an organ of the 16th century, and an ancient and much-venerated statue of the Virgin.
CHALUKYA—CHALYBITE

81 m. N. of Lyons by the Paris-Lyon railway. Pop. (1906) 26,538. It is a well-built town, with fine quays, situated in an extensive plain on the right bank of the Saône at its junction with the Canal du Centre. A handsome stone bridge of the 15th century, decorated in the 18th century with obelisks, connects it with the suburb of St Laurent on an island in the river. The principal building is the church of St Vincent, once the cathedral. It dates mainly from the 12th to the 15th centuries, but the façade is modern and pleasing. The old bishop's palace is a building of the 15th century. The church of St Pierre, with two lofty steeples, dates from the late 17th century. Chalon preserves remains of its ancient ramparts and a number of old houses. The administrative buildings are modern. An obelisk was erected in 1730 to commemorate the opening of the canal. There is a statue of J. N. Niepce, a native of the town. Chalon is the seat of a sub-prefect and a court of assizes, and there are tribunals of first instance and commerce, a branch of the Bank of France, a chamber of commerce, communal colleges for boys and girls, a school of drawing, a public library and a museum. Chalon ranks next to Le Creusot among the manufacturing towns of Burgundy; its position at the junction of the Canal du Centre and the Saône, and as a railway centre for Lyons, Paris, Dôle, Lons-le-Saunier and Châlon, brings it into strong trade connexion with the working and working of copper and iron is its main industry; the large engineering works of Petit-Creusot, a branch of those of Le Creusot, construct bridges, tug-boats and torpedo-boats; distilleries, glass-works, chemical works, straw-hat manufactories, oil-works, tile-works and sugar refineries also occupy many hands. Wine, grain, iron, leather and timber are among the many products for which the town is an entrepôt. About 2 m. east of Chalon is St Marcel (named after the saint who in the 2nd century preached Christianity at Chalon), which has a church of the 12th century, once belonging to a famous abbey.

Chalon-sur-Saône is identified with the ancient Cabillonum, originally an important town of the Aedui. It was chosen in the 6th century by Contram, king of Burgundy, as his capital; and it continued till the 10th to pay for its importance by being frequently sacked. The bishopric, founded in the 4th century, was suppressed at the Revolution. In feudal times Chalon was the capital of a countship. In 1237 it was given in exchange for other fiefs in the Jura by Jean de Saco, whose descendants nevertheless retained the castle. In 1464, when Burgundy was divided between the parties to the exchange, gave the citizens a communal charter in 1236. In its modern history the most important event was the resistance offered to a division of the Austrian army in 1814.

CHALUKYA, the name of an Indian dynasty which ruled in the Deccan from A.D. 550 to 750, and again from 973 to 1100. The Chalukyas themselves claimed to be Rajputs from the north who imposed their rule on the Dravidian inhabitants of the Deccan tableland, and there is some evidence for connecting them with the Chapas, a branch of the foreign Gurjaras. The dynasty was founded by a chief named Pulakesin I., who mastered the town of Vatapi (now Badami, in the Bijapur district) about 550. His sons extended their principality east and west; but the founder of the Chalukya greatness was his grandson Pulakesin II., who succeeded in 608 and proceeded to extend his rule at the expense of his neighbours. In 609 he established as his viceroy in Vengi his brother Kubja Vishnuvardana, who in 615 declared his independence and established the dynasty of Eastern Chalukyas, which lasted till 1070. In 620 the Saiva chief defeated Harsha (8th.), the powerful overlord of northern India, and established the Nerbudda as the boundary between the South and North. He also defeated in turn the Chola, Pandya and Kerala kings, and by 630 was beyond dispute the most powerful sovereign in the Deccan. In 642, however, his capital was taken and he himself killed by the Pallava king Narmasimhabharman. In 655 the Chalukya power was restored by Pulakesin's son Vikramaditya I.; but the struggle with the Pallavas continued till, in 740, Vikramaditya II. destroyed the Pallava capital. In 750 Vikramaditya's son, Kirtivarman Chalukya, was overthrown by the Rashtrakutas.

In 973, Taila or Tailapa II. (d. 995), a scion of the royal Chalukya race, succeeded in overthrowing the Rashtrakuta king, Kakkai II., and in recovering all the ancient territory of the Chalukyas with the exception of Gujarat. He was the founder of the dynasty known as the Chalukyas of Kalyani. About A.D. 1000 a formidable invasion by the Chola king Rajaraja the Great was defeated, and in 1052 Somesvara I., or Ahamavalla (d. 1068), the founder of Kalyani, defeated and slew the Chola Rajadhiraja. The reign of Vikramaditya VI., or Vikramanka, which lasted from 1076 to 1126, formed another period of Chalukya greatness. Vikramanka's exploits against the Hoysala kings and others, celebrated by the poet Bilhana, were held to justify him in establishing a new era dating from his accession. With his death, however, the Chalukya power began to decline. In 1156 the commander-in-chief Bijjala (or Vijjana) Kalachurya revolted, and he and his sons held the kingdom till 1183. In this year Somesvara IV. Chalukya recovered part of his patrimony, only to succumb, about 1190, to the Yadavas of Devagiri and the Hoysalas of Dorasamudra. Henceforth the Chalukya rajas ranked only as petty chiefs.

CHALYBÄUS, HEINRICH MORITZ (1796-1862), German philosopher, was born at Pfaffroda in Saxony. For some years he taught at Dresden, and won a high reputation by his lectures on the history of philosophy in Germany. In 1839 he became professor in Kiel University, where, with the exception of one brief interval, when he was expelled with several colleagues because of his German sympathies, he remained till his death. His first published work, Historische Entwicklung der spekulativen Philosophie von Kant bis Hegel (1837, 5th ed. 1860), which still ranks among the best expositions of modern German thought, has been twice translated into English, by A. Tulk (London, 1854), and by A. Edersheim (Edinburgh, 1854). His chief works are Entwurf eines Systems der Wissenschaftslehre (Kiel, 1846) and System der spekulativen Ethik (2 vols., 1850). He opposed both the extreme realism of Herbart and what he regarded as the one-sided idealism of Hegel, and endeavoured to find a mean between them, to discover the ideal or formal principle which unfolded itself in the material world presented to it. His Wissenschaftslehre, according to his own theory, consists in (1) Principlelehre, or theory of the one principle; (2) Verhältnungslehre, or theory of the means by which this principle realizes itself; and (3) Technologie. The most noticeable point is the position assigned by Chalybäus to the "World Ether," which is defined as the infinite in time and space, and which, he thinks, must be posited as necessarily coexisting with the Infinite Spirit or God. The fundamental principle of the System der Ethik is carried out with great strength of thought, and with an unusually complete command of ethical material.

CHALYBITE, a mineral species consisting of iron carbonate (FeCO₃) and forming an important ore of iron. It was early known as spathise iron, spathic iron or steel ore. F. S. Beudant in 1832 gave the name siderose (from σιδήρος, iron), which was modified by W. Haidinger in 1845 to siderite. Chalbite (from χάλης, χάλις, Lat. chalys, steel) is of slightly later date, having been given by E. H. Glower in 1847. The name siderite is in common use, but it is incorrect in two respects: (1) it is older than the body and was earlier applied to several other species, and is also now used as a group name for meteoric irons. Chalbite crystallizes in the rhombohedral system and is isomorphous with calcite; like this it possesses perfect cleavages parallel to the faces of the primitive rhombohedron, the angles between which are 75° 30'. Crystals are usually rhombohedral in habit, and the primitive rhombohedron r [100] is a common form, the faces being often curved as represented in the figure. Acute rhombohedra in combination with the basal pinacoid are also frequent, giving crystals of octahedral aspect. The mineral often occurs in cleavable
masses with a coarse or fine granular texture; also in botryoidal or globular (sphalerosiderite) and oölitic forms. When compact and mixed with much clay and sand it constitutes the well-known clay ironstone. Chalibyte is usually yellowish-grey or brown in colour; it is translucent and has a vitreous luster. Hardness 3½; sp. gr. 3.8. The double refraction ($\alpha = 0-241$) is stronger than that of calcite. When pure it contains $48-2\%$ of iron, but this is often partly replaced isomorphously by manganese, magnesium or calcium: the varieties known as oligon-spar or oligonite, sideropelite and sidero- dot contain these elements respectively in large amount. These varieties form a passage to ankerite (q.v.) and mellite, and all are referred to loosely as brown-spar.

Chalibyte is a common gange mineral in metalliferous veins, and well-crystallized specimens are found with ores of copper, lead, tin, &c., in Cornwall, the Harz, Saxony and many other places. It also occurs alone as large masses in veins and beds in rocks of various kinds. The clay ironstone so extensively worked as an ore of iron occurs as nodules and beds in the Coal Measures of England and the United States, and the ore of the Cleveland district is in the Lias. The mineral is occasionally found as concretionary masses (sphalerosiderite) in cavities in basic igneous rocks such as dolerite.

L. J. S.

CHAMBA, a native state of India, within the Punjab, amid the Himalayas, and lying on the southern border of Kashmir. It has an area of 3,216 sq. m. Pop. (1901) 127,834. The sanatorium of Dalhousie, though within the state, is attached to the district of Gurdaspur. Chamba is entirely mountainous; in the east and north, and in the centre, are snowy ranges. The valleys in the west and south are fertile. The chief rivers are the Chandra and Ravi. The country is much in favour with sportsmen. The principal crops are rice, maize and millet. Mineral ores of various kinds are known, but unworked. Trade is chiefly in forest produce. The capital of the state is Chamba (pop. 6,000), situated above the gorge of the Ravi. External communications are entirely by road. The state was founded in the 6th century, and, though sometimes nominally subject to Kashmir and afterwards tributary to the Mogul empire, it had always practically maintained its independence. Some of its chalibites are preserved in a series of cabinets, mostly engraved on copper. It first came under British influence in 1846, when it was declared independent of Kashmir. The line of the rajahs of Chamba was founded in the 6th century A.D. by Murut, of an ancient family of Rajputs. In 1904 Bhuri Singh, K.C.S.I., C.I.E., an enlightened and capable ruler, succeeded.

CHAMBAL, a river of India, one of the principal tributaries of the Jumna. Rising amid the summits of the Vindhya mountains in Malwa, it flows north, and after being joined by the Chambia and Cipira, passes through the gorges of the Mokandar hills. After receiving the waters of the Kali-Sind, Parbatia and Banas, its principal confluent, the Chambal becomes a great river, enters the British district of Etawah, and joins the Jumna 40 m. below Etawah town, its total length being 650 m.

CHALIBERN, JOSEPH (1836– ), British statesman, third son of Joseph Chamberlain, master of the Cordwainers' Company, was born at Camberwell Grove, London, on the 8th of July 1836. His father was a well-to-do man of business, a Unitarian in religion and a Liberal in politics. Young Chamberlain was educated at Canobury from 1845 to 1850, and at University College school, London, from 1850 to 1852. After two years in his father's office in London, he was sent to Birmingham to join his cousin Joseph Nettleford in a screw business in which his father had an interest; and by degrees, largely owing to his own intelligent management, this business became very successful. Nettleford & Chamberlain employed new methods of attracting customers, and judiciously amalgamated rival firms with their own so as to reduce competition, with the result that in 1874, after twenty-two years of commercial life, Mr Chamberlain was able to retire with an ample fortune. Meanwhile he had in 1861 married (first wife, Miss Harriet Kenrick (d. 1865), and had gradually come to take an increasingly important part in the municipal and political life of Birmingham. He was a constant speaker at the Birmingham and Edgbaston Debating Society; and when in 1868 the Birmingham Liberal Association was reorganized, he became one of its leading members. In 1860 he was elected chairman of the executive council of the new National Education League, the outcome of Mr George Dixon's movement for promoting the education of the children of the lower classes by paying their school fees, and agitating for more accommodation and a better national system. In the same year he was elected a member of the town council, and married his second wife—a cousin of his first—Miss Florence Kenrick (d. 1875).

In 1870 he was elected a member of the first school board for Birmingham; and for the six next years, and especially after 1873, when he became leader of a majority and chairman, he actively championed the Nonconformist opposition to denominationalism. He was then regarded as a Republican—the term signifying rather that he held advanced Radical opinions, which he frequently expressed in his own speeches, and with which he was in some measure at variance. The political developments in France, than that he really favoured Republican institutions. His programme was “free Church, free land, free schools, free labour.” At the general election of 1874 he stood as a parliamentary candidate for Sheffield, but without success. Between 1869 and 1873 he was a prominent advocate in the Birmingham town council of the gospel of municipal reform preached by Mr Dawson, Dr Dale and Mr Bunce (of the Birmingham Post); and in 1873 his party obtained a majority, and he was elected mayor, an office he retained until June 1876. As mayor he had to receive the prince and princess of Wales on their visit in June 1874, an occasion which excited some curiosity because of his reputation as a Republican; but those who looked for an exhibition of bad taste were disappointed, and the behaviour of the Radical mayor satisfied the requirements alike of The Times and of Punch.

The period of his mayoralty was one of historic importance in the growth of modern Birmingham. New municipal buildings were erected, Highgate Park was opened as a place of recreation, the first library, a free technical school, and many streets were laid out. But the greatest work carried through by Mr Chamberlain for Birmingham was the municipalization of the supply of gas and water, and the improvement scheme by which slums were cleared away and forty acres laid out in new streets and open spaces. The prosperity of modern Birmingham dates from 1875 and 1876, when these admirably administered reforms were initiated, and by his share in them Mr Chamberlain became not only one of its most popular citizens but also a man of mark outside. An orator of a business-like, straightforward type, cool and hard-hitting, his spare figure, incisive features and single eye-glass soon made him a favourite subject for the caricaturist, and in later life his aggressive personality, and the peculiarly irritating effect it had on his opponents, made his actions and speeches the object of more controversy than was the lot of any other politician of his time. His hobby for orchid-growing at his house “Highbury” near Birmingham also became famous. In private life his loyalty to his friends, and his “genius for friendship” (as John Morley said) made a curious contrast to his capacity for arousing the bitterest political hostility. It may be added that the loyalty of his father to the Established Church which he enjoyed throughout his life, and he was largely instrumental in starting the Birmingham University (1900), of which he became chancellor.

His connexion with Birmingham University was indeed peculiarly appropriate to his character as a man of business; but in spite of his representing a departure among men of the front rank in politics from the “Eton and Oxford” type, his general culture sometimes surprised those who did not know him. In later life Oxford and Cambridge gave him their doctors' degrees; and in 1897 he was made lord rector of Glasgow.
University (delivering an address on “Patriotism” at his installation).

In 1876 Mr Dixon resigned his seat in parliament, and Mr Chamberlain was returned for Birmingham in his place unopposed, as John Bright’s colleague. He made his maiden speech in the House of Commons on the 4th of August 1876, on Lord Sandon’s Education Bill. At this period, too, he paid much attention to the question of licensing reform, and in 1876 he examined the Gothenburg system in Sweden, and advocated a solution of the problem in England on similar lines. During 1877 the new federation of Liberal Associations which became known as the “Caucus” was started under Mr Chamberlain’s influence in Birmingham—its secretary, Mr Schnadhorst, quickly making himself felt as a wire-puller of exceptional ability; and the new organization had a remarkable effect in putting life into the Liberal party, which since Mr Gladstone’s retirement in 1874 had been much in need of a stimulus. When the general election came in 1880, Mr Schnadhorst’s powers were demonstrated in the successes won under his auspices. The Liberal party numbered 349, against 243 Conservatives and 60 Irish Nationalists; and the Radical section of the Liberal party, led by Mr Chamberlain and Sir Charles Dilke, was recognized by Mr Gladstone by his inclusion in the former in his cabinet as president of the Board of Trade, and the appointment of the latter as under secretary for foreign affairs. In his new capacity Mr Chamberlain was responsible for carrying such important measures as the Bankruptcy Act 1883, and the Patents Act. Another bill which he had much at heart, on merchant shipping, had to be abandoned, and a royal commission substituted, but the subsequent legislation in 1888–1894 owed much to his efforts. The Franchise Act of 1884 was also one in which he took a leading part as a champion of the opinions of the labouring class. At this time he took the current advanced Radical views of both Irish and foreign policy, hating “coercion,” disliking the occupation of Egypt, and prominently defending the Transvaal settlement at Majuba. Both before and after the defeat of Mr Gladstone’s government on the Budget in June 1885, he associated himself with what was known as the “Unauthorized Programme,” i.e., free education, small holdings, graduated taxation, and local government. In June 1885 he made a speech at Birmingham, treating the reforms just mentioned as the “ransom” that property must pay to society for the security it enjoys—for which Lord Iddesleigh called him “Jack Cade”; and he continually urged the Liberal party to take up these Radical measures. At the general election of November 1885 Mr Chamberlain was returned for West Birmingham. The Liberal strength generally was, however, reduced to 335 members, though the Radical section held their own; and the Irish vote became necessary to Mr Gladstone if he was to command a majority. In December it was stated that Mr Gladstone intended to propose Home Rule for Ireland, and in January Lord Salisbury’s ministry was defeated on the Address, on an amendment moved by Mr Chamberlain’s Birmingham henchman, Mr Jesse Collings (b. 1831), embodying the “three acres and a cow” of the Radical programme. Unlike Lord Hartington (afterwards duke of Devonshire) and other Liberals, who declined to join Mr Gladstone in view of the altered attitude he was adopting towards Ireland, Mr Chamberlain entered the cabinet as representative of the Local Government Board (with Mr Jesse Collings as parliamentary secretary), but on the 15th of March 1886 he resigned, explaining in the House of Commons (8th April) that, while he had always been in favour of the largest possible extension of local government to Ireland consistently with the integrity of the empire and the supremacy of parliament, and had therefore joined Mr Gladstone when he believed that this was what was intended, he was unable to consider that the scheme communicated by Mr Gladstone to his colleagues maintained those limitations. At the same time he was not irreconcilable, and he invited Mr Gladstone even then to modify his bill so as to remove the objections made to it. This indecisive attitude did not last long, and the split in the party rapidly widened. At Birmingham Mr Chamberlain was supported by the “Two Thousand,” but deserted by the “Caucus” and Mr Schnadhorst. In May the Radicals who followed Mr Bright and Mr Chamberlain, and the Whigs who took their cue from Lord Hartington, decided to vote against the second reading of the Home Rule Bill, instead of allowing it to be taken and then pressing for modifications in committee, and on 7th June the bill was defeated by 343 to 313, 94 Liberal Unionists—as they were generally called—voting against the government. Mr Chamberlain was the object of the bitter attacks from the Gladstonians for his share in this result; he was stigmatized as “Judas,” and open war was proclaimed by the Home Rulers against the “dissentient Liberals”—the description used by Mr Gladstone. The general election, however, returned to parliament 316 Conservatives, 78 Liberal Unionists, and only 276 Gladstonians and Nationalists, Birmingham returning seven Unionist members. When the House met in August, it was decided by the Liberal Unionists, under Lord Hartington’s leadership, that their policy henceforth was essentially to combine with the Tories to keep Mr Gladstone out. The old Liberal feeling still prevailing among them was too strong, however, for their leaders to take office in a coalition ministry. It was enough for them to be the principal opposition; government to such measures as were not offensive to Liberal Unionists. It still seemed possible, moreover, that the Gladstonians might be brought to modify their Home Rule proposals, and in January 1887 a Round Table conference (suggested by Mr Chamberlain) was held between Mr Chamberlain, Sir G. Trevelyan, Sir William Harcourt, Mr Morley and Lord Horschell. But no rapprochement was effected, and reconciliation became daily more and more difficult. The influence of Liberal Unionist views upon the domestic legislation of the government was steadily bringing about a more complete union in the Unionist party, and destroying the old lines of political cleavage. Before 1892 Mr Chamberlain had the satisfaction of seeing Lord Salisbury’s ministry pass such important acts, from a progressive point of view, as those dealing with Coal Mines Regulation, Allotments, County Councils, Housing of the Working Classes, Free Education and Agricultural Holdings, besides Irish legislation like the Ashbourne Act, the Land Act of 1891, and the Light Railways and Congested Districts Acts. In October 1887 Mr Chamberlain, Sir L. Sackville West and Sir Charles Trevelyan were selected by the government as British plenipotentiaries to discuss with the United States the Canadian fisheries dispute, and a treaty was arranged by them at Washington on the 15th of February 1888. The Senate refused to ratify it; but a protocol provided for a modus vivendi pending ratification, giving American fishing vessels similar advantages to those contemplated in the treaty; and on the whole Mr Chamberlain’s mission to America was accepted as a successful one in maintaining satisfactory relations with the United States. He returned to England in March 1888, and was presented with the freedom of the borough of Birmingham. The visit also resulted, in November 1888, in his marriage with his third wife, Miss Endicott, daughter of the United States secretary of war in President Cleveland’s first administration.

At the general election of 1892 Mr Chamberlain was again returned, with an increased majority; for West Birmingham; but the Unionist party as a whole came back with only 315 members against 395 Home Rulers. As soon as Lord Salisbury’s ministry was defeated; and on the 13th of February 1892 Mr Gladstone introduced his second Home Rule Bill, which was eventually read a third time on the 1st of September. During the eighty-two days’ discussion in the House of Commons Mr Chamberlain was the life and soul of the opposition, and his criticisms had a vital influence upon the attitude of the country when the House of Lords summarily threw out the bill. His chief contribution to the discussions during the later stages of the Gladstone and Rosebery ministries was in connexion with Mr Asquith’s abortive Employers’ Liability Bill, when he foreshadowed the method of dealing with this question afterwards carried out in the Compensation Act of 1897. Outside parliament he was busy formulating proposals for old age pensions, which had a prominent place in the Unionist programme of 1895. In
that year, on the defeat of Lord Rosebery, the union of the Unionists was sealed by the inclusion of the Liberal Unionist leaders in Lord Salisbury’s ministry; and Mr Chamberlain became secretary of state for the colonies. There had been much speculation as to what his post would be, and his nomination to the colonial office, then considered one of secondary rank, excited some surprise; but Mr Chamberlain himself realized how important that department had become. He carried with him into the ministry his close Birmingham municipal associates, Mr Jesse Collings (as under secretary of the home office), and Mr J. P. Williams (1840-1904) as financial secretary to the war office. Mr Chamberlain’s influence in the Unionist cabinet was soon visible in the Workmen’s Compensation Act and other measures. This act, though in Sir Matthew White Ridley’s charge as home secretary, was universally and rightly associated with Mr Chamberlain; and its passage, in the face of much interested opposition from highly-placed, old-fashioned conservatives and capitalists on both sides, was principally due to his determined advocacy. Another “social” measure of less importance, which formed part of the Chamberlain programme, was the Small House Acquisi1on Act of 1899; but the problem of old age pensions was less easily solved. This subject had been handed over in 1895 to a royal commission, and by a select committee in 1899 and a departmental committee in 1900, but both of these threw cold water on the schemes laid before them—a result which, galling enough to one who had made so much play with the question in the country, offered welcome material to his opponents for electioneering recrimination, as year by year went by between 1895 and 1900 and nothing resulted from all the confident talk on the subject in which Mr Chamberlain had indulged when out of office. Eventually it was the Liberal and not the Unionist party that carried an Old Age Pensions scheme through parliament, during the 1908 session, when Mr Chamberlain was hons de combat.

From January 1896 (the date of the Jameson Raid) onwards South Africa demanded the chief attention of the colonial secretary (see South Africa, and for details Transvaal). In his negotiations with President Kruger one masterful temperance was pitted against another. Mr Chamberlain had a very difficult part to play, in a situation dominated by suspicion on both sides. He firmly stood up for the rights of Great Britain and of British subjects in the Transvaal, but his continual object of Radical criticism at home. Never has a statesman’s personality been more bitterly associated by his political opponents with the developments they deplored. Attempts were even made to ascribe financial motives to Mr Chamberlain’s actions, and the political atmosphere was thick with suspicion and scandal. The report of the Commons committee (July 1897) definitely acquitted both Mr Chamberlain and the colonial office of any privity in the Jameson Raid, but Mr Chamberlain’s detractors continued to assert the contrary. Opposition hostility reached such a pitch that in 1899 there was hardly an act of the cabinet during the negotiations with President Kruger which was not attributed to the personal malignity and unscrupulousness of the colonial secretary. The elections of 1900 (when he was again returned, unopposed, for West Birmingham) turned upon the individuality of a single minister more than since the days of Mr Gladstone’s ascendancy, and Mr Chamberlain, never conspicuous for inclination to turn his other cheek to the smiter, was not slow to return the blows with interest.

Apart from South Africa, his most important work in 1899-1900 was the successful passing of the Australian Commonwealth Act (1900), in which both tact and firmness were needed to settle certain differences between the imperial government and the colonial delegates.

Mr Chamberlain’s tenure of the office of colonial secretary between 1895 and 1900 must always be regarded as a turning-point in the history of the relations between the British colonies and the mother country. His accession to office was marked by speeches breathing a new spirit of imperial consolidation, embodied either in suggestions for commercial union or in more immediately practicable proposals for improving the “imperial estate”; and at the Diamond Jubilee of 1897 the visits of the colonial premiers to London emphasized and confirmed the new policy, the fruits of which were afterwards seen in the colonial support given by the colonies in the Boer War. Even in what Mr Chamberlain called his “Radical days” he had never supported the “Manchester” view of the value of a colonial empire; and during the Gladstone ministry of 1882-1885 Mr Bright had remarked that the junior member for Birmingham was the only Jingo in the cabinet—meaning, no doubt, that he objected to the policy of laissez-faire and the timidity of what was afterwards known as “Little Englandism.” While he was still under Mr Gladstone’s influence these opinions were kept in subordination; but Mr Chamberlain was always an imperial federalist, and from 1887 onwards he constantly gave expression to his views on the desirability of drawing the different parts of the empire closer together for purposes of defence and commerce. In 1893 the time for the realization of these views had come; and Mr Chamberlain’s speeches, previously remarkable chiefly for debating power and directness of argument, were now dominated by a new note of constructive statesmanship, basing itself on the economic necessities of a world-wide empire. Not the least of the anxieties of the colonial office during this period, however, was the danger that the South African sugar industry was being steadily undermined by the European bounties given to exports of continental beet; and though the government restricted themselves to attempts at removing the bounties by negotiation and to measures for palliating the worst effects in the West Indies, Mr Chamberlain made no secret of his repudiation of the Cobden Club view that retaliation would be contrary to the doctrines of free trade, and he did his utmost to educate public opinion at home into understanding that the responsibilities of the mother country are not merely to be construed according to the selfish interests of a nation of consumers.

As regards foreign affairs, Mr Chamberlain more than once (particularly at Leicester on 30th November 1899) indicated his leanings towards a closer understanding between the British empire, the United States and Germany,—a suggestion which did not save him from an extravagant outburst of German hostility during the Boer War. The unusually outspoken and pointed expression, however, of his disinclination to submit to Muscovite duplicity or to “pin-pricks” or “unmanliness” of Mr Farnsworth was criticized on the score of discretion by a wider circle than that of his political adversaries.

During the progress of the Boer War from 1899 to 1902, Mr Chamberlain, as the statesman who had represented the cabinet in the negotiations which led to it, remained the object of constant attacks from his Radical opponents—the “little Englishers” and “Pro-Boers,” as he called them—and he was supported by the Imperialist and Unionist party with at least equal ardour. But as colonial secretary, except in so far as his consistent support of Lord Milner and his enthusiastic encouragement of colonial assistance were concerned, he naturally played only a subordinate part during the carrying out of the military operations. Among domestic statesmen he was felt, however, to be the backbone of the party in power. He was the hero of the one side, just as he was the bugbear of the other. On the 13th of February 1902 he was presented with an address in a gold casket by the city corporation, and entertained at luncheon at the Mansion House, an honour not unconnected with the strong feeling recently aroused by his firm reply (at Birmingham, January 11) to some remarks made by Count von Bülow, the German chancellor, on the Zanzibar (January 8), reflecting the offensive allegations current in Germany against the conduct of the army in South Africa. Mr Chamberlain’s speech, in answer to what had been intended as a contemptuous rebuke, was universally applauded. His own imperialism was intensified by the way in which England’s difficulties resulted in calling forth colonial assistance and so cementing the bonds of empire. The domestic crisis, and the sharp cleavage between parties at home, had driven the bent of his mind and policy further and further away from the purely municipal and national ideals which he had followed so keenly before he became colonial minister. The
problems of empire engrossed him, and a new enthusiasm for imperial projects arose in the Unionist party under his inspiration. No English statesman probably has ever been, at different times in his career, so able an advocate of absolutely contradictory policies, and his opponents were not slow to taunt him with quotations from his earlier speeches. As the war drew to its end, new plans for imperial consolidation were maturing in his brain. Subsidiary points of utility, such as the formation of the London and Liverpool schools of tropical medicine from 1899 onwards, were taken up by him with characteristic vigour. But the next step was to prove a critical one indeed for the loyalty of the party which had so far been unanimous in his favour.

The settlement after the war was full of difficulties, financial and others, in South Africa. When Mr Arthur Balfour succeeded Lord Salisbury as prime minister in July 1902, Mr Chamberlain agreed to serve loyally under him, and the friendship between the two leaders was indeed one of the most marked features of the political situation. In November 1902 it was arranged that Mr Chamberlain should go out to South Africa, and it was hoped, not without reason, that his personality would effect more good than any ordinary official negotiations. At the time the best results appeared to be secured. He went from place to place in South Africa (December 26–February 23); arranged with the leading Transvaal financiers that in return for support from the British government in raising a Transvaal loan they would guarantee a large proportion of a Transvaal debt of £30,000,000, which should repay the British treasury so much of the cost of the war; and when he returned in March 1903, satisfaction was general in the country over the success of his mission. But meantime two things had happened. He had looked at the empire from the colonial point of view, in a way only possible in a colonial atmosphere; and at home some of his colleagues had gone a long way, behind the scenes, to destroy one of the very factors on which the question of a practical scheme for imperial commercial federation seemed to hinge. In the budget of 1902 a duty of a shilling a quarter impounded had been reintroduced. This small tax was regarded as only a registration duty. Even by free-trade ministers like Gladstone it had been left up to 1869 untouched, and its removal by Robert Lowe (Lord Sherbrooke) had since then been widely regarded as a piece of economic pedantry. Its reimpunition, officially supported for the sake of necessary revenue in war-time, and cordially welcomed by the Unionist party, had justified itself, as they contended, in spite of the criticisms of the Opposition (who raised the cry of the "dear loaf"), by proving during the year to have had no general or direct effect on the price of bread. And the more advanced Imperialists, as well as the more old-fashioned protectionists (like Mr Chaplin) who formed an integral body of the Conservative party, had looked forward to this tax being converted into a differential one between foreign and colonial corn, so as to introduce a scheme of colonial preference and commercial consolidation between the colonies and the mother country. In South Africa this in any other British colony, since all of them were accustomed to tariffs of a protectionist nature, and the idea of a preference (already started by Canada) was fairly popular—Mr Chamberlain had found this view well established. The agitation in England against the tax had now blown over. The Unionist rank and file were committed to its support,—many even advocating its increase to two shillings at least. But Mr Ritchie, the chancellor of the exchequer, having a surplus in prospect and taxation to take off, carried the cabinet in favour of again remitting this tax on corn. Mr Chamberlain himself had proposed only to take it off as regards colonial, and not foreign corn,—thus inaugurating a preferential system. But a majority of the cabinet supported Mr Ritchie. The remission of this tax, after all the conviction with which its restoration had been supported a year before, was very difficult for the party itself to stomach, and on any ground it was a distasteful act, loyally as the party followed their leaders. But to those who had looked to it as providing a lever for a gradual change in the established fiscal system, the role-face was a bitter blow, and at once there began, though not at first openly, a split between the more rigid free-traders—advocates of cheap food and free imports—and those who desired to use the opportunities of a tariff, of however limited a kind, for attaining national and imperial and not merely revenue advantages. This idea, which had for some time been floating in Mr Chamberlain's mind (see especially his speech at Birmingham of May 16, 1902), now took full possession of it. For the moment he remained in the cabinet, but the seed of disension was sown. The first public intimation of his views was given in a speech to his constituents at Birmingham (May 15, 1903), when he outlined a plan for raising more money by a rearranged tariff, partly to obtain a preferential system for the empire and partly to produce funds for social reform at home. On May 28th in the House of Commons he spoke on the same subject, and declared "if you are to give a preference to the colonies, you must put a tax on food." Considered in the light of after events, this putting the necessity of food-taxes in the foreground was decidedly injudicious; but imperialist conviction and enthusiasm were more conspicuous than electioneering tact in the launching of Mr Chamberlain's scheme.

The movement grew quickly, its supporters including a number of the cleverest younger politicians and journalists in the Unionist party. The idea of tariff reform—to broaden the basis of taxation, to introduce a preference, and to stimulate home industries and increase employment—took firm root; and the political economists of the party—Prof. W. Cunningham, Prof. W. Ashley and Prof. W. A. S. Hewins, in particular—brought effective criticism to bear on the one-sided "free trade" in vogue. The first demand was for inquiry. The country was still bearing an income-tax of elenvement in the pound; it appeared that the old sources of revenue were inadequate; and meanwhile the statistics of trade, it was argued, showed that the English free-import system hampered English trade while providing the foreigner with a free market. Mr Chamberlain and his supporters argued that since 1870 certain other countries (Germany and the United States), with protective tariffs, had increased their trade in much larger proportion, while English trade had only been maintained by the increased business done with British colonies. A scientific inquiry into the facts was needed. By the Opposition, who now found themselves the defenders of conservatism in the established fiscal policy of the country, this whole argument was scouted; but for a time the demand merely for inquiry, and the production of figures, gave no sufficient occasion for disension among Unionists, even when, like Sir M. Hicks Beach, they were convinced free-importers on purely economic grounds; and Mr Balfour (q.v.), as premier, managed to hold his colleagues and party together by taking the line that particular opinions on economic subjects should not be made a test of party loyalty. The Board of Trade was set to work to produce fiscal Blue-books, and hum-drum politicians who had never shown any genius for figures suddenly blossomed out into arithmeticians of the deepest dye. The Tariff Reform League was founded in order to further Mr Chamberlain's policy, holding its inaugural meeting on July 21st; and it began to take an active part in issuing leaflets and in work at by-elections. Discussion proceeded hotly on the merits of a preferential tariff, and on August 15th a manifesto appeared against it signed by fourteen professors or lecturers on political economy, including Mr Leonard Courtney, Professor Edgeworth, Professor Marshall, Professor Bastable, Professor Smart, Professor J. S. Nicholson, Professor Gonner, Mr Bowley, Mr E. Cannan and Mr L. R. Phelps,—men of admitted competence, yet after all, of no higher authority than the economists supporting Mr Chamberlain, such as Dr Cunningham and Professor Ashley.

Meanwhile, the death of Lord Salisbury (August 22) removed a weighty figure from the councils of the Unionist party. The cabinet met several times at the beginning of September, and the question of their attitude towards the fiscal problem became acute. The public had its first intimation of impending events in the appearance on September 16th of Mr Balfour's Economic
Notes on Insular Free Trade, which had been previously circulated as a cabinet memorandum. The next day appeared the Board of Trade Fiscal Blue-book. And on the 8th the resignations were announced, not only of the more rigid free-traders in the cabinet, Mr Ritchie and Lord George Hamilton, but also of Mr Chamberlain. Letters in cordial terms were published, which had passed between Mr Chamberlain (September 9) and Mr Balfour (September 16). Mr Chamberlain pointed out that he was committed to a preferential scheme involving new duties on food, and could not remain in the government without prejudice while it was excluded from the party programme; remaining loyal to Mr Balfour and his general objects, he could best promote this course from outside, and he suggested that the government might confine its policy to the "assertion of our freedom in the case of all commercial relations with foreign countries." Mr Balfour, while reluctantly admitting the necessity of Mr Chamberlain's taking a freer hand, expressed his agreement in the desirability of a closer fiscal union with the colonies, but questioned the immediate practicability of any scheme; he was willing to adopt fiscal reform so far as it covered retaliatory duties, but thought that the exclusion of taxation of food from the party programme was in existing circumstances necessary, so long as public opinion was not ripe. At the same time he welcomed the fact that Mr Chamberlain's son, Mr Austen Chamberlain, was ready to remain a member of the government. Mr Austen Chamberlain (b. 1863) accordingly became the new chancellor of the exchequer; he was already in the cabinet as postmaster-general, having previously made his mark as civil lord of the admiralty (1895-1900), and financial secretary to the treasury (1900-1902).

From the turning-point of Mr Chamberlain's resignation, it is not necessary here to follow in detail the discussions and dis- 
sensions in the party as a whole in its relations with the prime minister (see Balfour, A. J.). It is sufficient to say that while Mr Balfour's sympathetic "send off" appeared to indicate his inclination towards Mr Chamberlain's programme, if only further support could be gained for it, his endeavours to keep the party together, and the violent opposition which gathered against Mr Chamberlain's scheme, combined to make his real attitude during the next two years decidedly obscure, both sections of the party—free-traders and tariff reformers—being induced from time to time to regard him as on their side. The tariff reform movement itself was now, however, outside the purely official programme, and Mr Chamberlain (backed by a majority of the Unionist members) threw himself with impetuous ardour into a crusade on its behalf, while at the same time supporting Mr Balfour in parliament, and leaving it to him to decide as to the policy of going to the country when the time should be ripe. In his own words, he went in front of the Unionist army as a pioneer, and if his army was attacked he would go back to it; in no conceivable circumstances would he allow himself to be put in any sort of competition, direct or indirect, with Mr Balfour, his friend and leader, whom he meant to follow (October 6).

On October 6th he opened his campaign with a speech at Glasgow. Analysing the trade statistics as between 1872 and 1902, he insisted that British progress involved a relative decline compared with that of protectionist foreign countries like Germany and the United States; Great Britain exported less and less of manufactured goods, and imported more and more; the exports to foreign countries had decreased, and it was only the increased exports to the colonies that maintained the British position. This was the outcome of the working of a one-sided free-trade system. Now was the time, and it might soon be lost, for consolidating British trade relations with the colonies. If the mother country and her daughter states did not draw closer, they would inevitably drift apart. A further increase of £26,000,000 a year in the trade with the colonies might be obtained by a preferential tariff, and this meant additional employment at home for 166,000 workmen, or subsistence for a population of a far larger number. His positive proposals were: (1) no tax on raw materials; (2) a small tax on food other than colonial, e.g. two shillings a quarter on foreign corn but excepting maize, and 5% on meat and dairy produce excluding bacon; (3) a 10% general tariff on imported manufactured goods. To meet any increased cost of living, he proposed to reduce the duties on tea, sugar and other articles of general consumption, and he estimated that his scheme would in no case increase a workingman's expenditure, and in most cases would reduce it. "The colonies," he said, "are prepared to meet us; in return for a very moderate preference, they will give us a substantial advantage in their markets." This speech, delivered with characteristic vigour and Imperialistic enthusiasm, was the type of others which followed in quick succession during the year. At Green- 

On the next day he emphasized the necessity of retalling against foreign tariffs—"I never like being hit without striking back." The practice of "dumping" must be fairly met; if foreign goods were brought into England to undersell British manufacturers, either the Fair Wages Clause and the Factory Acts and the Compensation Act would have to be repealed, or the workmen would have to take lower wages, or lose their work. "Agriculture has been practically destroyed, sugar has gone, silk has gone, iron is threatened, wool is threatened, cotton will go! How long are we going to stand it?" On October 20th he spoke at New-

A. on the 21st. Tyne-built, on the 27th at Liverpool, insisting that free-trade had never been a country-class measure and that it could not be reconciled with the tariff; on November 4th at Birmingham, on the 20th at Cardiff, on the 21st at Newport, and on December 16th at Leeds. In all these speeches he managed to point his argument by application to local industries. In the Leeds speech he announced that, with a view to drawing up a scientific model tariff, a non-political commission of representative experts would be appointed under the auspices of the Tariff Reform League to take evidence from every trade; it included many heads of businesses, and Mr Charles Booth, the eminent student of social and industrial London, with Sir Robert Herbert as chairman, and Professor W. A. S. Hewins as secretary. The name of "Tariff Commission," given to this voluntary and unofficial body, was a good deal criticized, but though flouted by the political free-traders it set to work in earnest, and accumulated a mass of evidence as to the real facts and as to the results of which promised to be invaluable to economic inquirers. On January 18th, 1904, Mr Chamberlain ended his series of speeches by a great meeting at the Guildhall, in the city of London, the key-note being his exhortation to his audience to "think imperially."

All this activity on Mr Chamberlain's part represented a great physical and intellectual feat on the part of a man now sixty-seven years of age; but his bodily vigour and comparatively youthful appearance were essential features of his personality. Nothing like this campaign had been known in the political world since Mr Gladstone's Midlothian days; and it produced a great public impression, stirring up both supporters and opponents. Free-trade unionists like Lord Goschen and Lord Hugh Cecil, and the Liberal leaders—for whom Mr Asquith became the principal spokesman, though Lord Rosebery's criticisms also had considerable weight—found new matter in Mr Chamberlain's speeches for their contention that any radical change in the traditional English fiscal policy, established now for sixty years, would only add to the evil. The head fact remained that while Mr Chamber- 

A. lin's activity gathered round him the bulk of the Unionist members and an enthusiastic band of economic sympathizers, the country as a whole remained apathetic and unconvinced. One reason was the intellectual difficulty of the subject and the double-faced character of all arguments from statistics, which were either incomprehensible or disputable; another was the fact that substantially this was a political movement, and that tariff reform was, after all, only one in a complexity of political issues, most of which during this period were being interpreted by the electorate in a sense hostile to the Unionist party. Mr Chamberlain had relied on his personal influence, which from 1895 to 1902 had been supreme; but his own resignation, and the course of events, had since 1903 made his personality less authoritative, and new interests—such as the opposition to the Education Act, to the heavy taxation, and to Chinese labour in the
Transvaal, and indignation over the revelations concerned with the war were monopolizing attention, to the weakening of his hold on the public. The revival in trade, and the production of new statistics which appeared to stultify Mr Chamberlain's prophecies of progressive decline, enabled the free-trade champions to reassure their audiences as to the very foundation of his case, and to represent the whole tariff reform movement as no less unnecessary than risky. Moreover, the split in the Unionist party brought the united Liberal party in full force into the field, and at last the country began to think that the danger of Irish Home Rule was practically over, and that a Liberal majority might be returned to power in safety, with the prospect of providing an alternative government which would assure commercial repose (Lord Rosebery's phrase), relief from extravagant expenditure, and—as the working-classes were led to believe—a certain amount of labour legislation which the Tory leaders would never propose. On the other hand the colonies took a great interest in the new movement, though without putting any such pressure on the home public as Mr Chamberlain might have expected. At the opening of 1904 he was officially invited by Mr Deakin, the prime minister of Australia, to pay a visit to Australia, in order to expound his scheme, being promised an enthusiastic welcome "as the harbinger of commercial reciprocity between the mother country and her colonies." Mr Chamberlain, however, declined; his work at home was too pressing.

From the end of Mr Chamberlain's series of expository speeches on his scheme of tariff reform, onwards during the various fiscal debates and discussions of 1904, it is unnecessary to follow events in detail. The scheme was now before the country, and Mr Chamberlain was anxious to take its verdict. Time was not on his side at his age, and if he had to be beaten at one election he was anxious to get rid of the other issues which would encumber the popular vote, and to press on to a second when he would be on the attacking side. But he would make no move which would embarrass Mr Balfour in parliament, and adhered to his promise of loyalty. The result was a long drawn out interval, while the government held on and its supporters became more embittered over their differences. Mr Chamberlain needed a rest, and was away in Italy and Egypt from March to May, and again in November. He made three important speeches at Welbeck (August 4), at Luton (October 3), and at Limehouse (December 15), but he had nothing substantial to add to his case, and the party situation continued in all its embarrassments. Mr Balfour's introduction of his promise (at Edinburgh on October 3) to convene an imperial conference after the general election if the Unionists came back to power, in order to discuss a scheme for fiscal union, represented an academic rather than a practical advance, since the by-elections showed that the Unionists were certain to be defeated. The one important new development concerned the Liberal-Unionist organization. In January some correspondence was published between Mr Chamberlain and the duke of Devonshire, dating from the previous October, as to difficulties arising from the central Liberal-Unionist organization, and to discussions between Sir Henry Campbell-Bannerman and Mr Chamberlain of a scheme of tariff reform. The duke objected to this departure from neutrality, and suggested that it was becoming "impossible without any advantage to maintain under existing circumstances the existence of the Liberal-Unionist organization." Mr Chamberlain retorted that this was a matter for a general meeting of delegates to decide; if the duke was outvoted he might resign his presidency; for his own part he was prepared to allow the local associations to be subsidized impartially, so long as they supported the government, but he was not prepared for the violent disruption, which the duke apparently contemplated, of an association so necessary to the success of the Unionist cause. The duke was in a difficult position as president of the organization, since most of the local associations supported Mr Chamberlain, and he replied that the differences between them were vital, and he would not be responsible for dividing the association into sections, but would rather resign. Mr Chamberlain then called a general meeting on his own responsi-

bility in February, when a new constitution was proposed; and in May, at the annual meeting of the Liberal-Unionist council, the free-trade Unionists, being in a minority, retired, and the association was reorganized under Mr Chamberlain's auspices, Lord Lansdowne and Lord Selborne (both of them cabinet ministers) becoming vice-presidents. On July 14th the reconstituted Liberal-Unionist organization held a great demonstration in the Albert Hall, and Mr Chamberlain's success in outving the duke of Devonshire and the other free-trade members of the old Liberal-Unionist party, and imposing his own fiscal policy upon the Liberal-Unionist caucus, was now complete.

During the spring and summer of 1905 Mr Chamberlain's more active supporters were in favour of forcing a dissolution by leaving the government in a minority, but he himself preferred to leave matters to take their course, so long as the prime minister was content to be publicly identified with the policy of eventually fighting on tariff reform lines. Speaking at the Albert Hall in July Mr Chamberlain pushed somewhat further than before his "embrace" of Mr Balfour; and in the autumn, when foreign affairs no longer dominated the attention of the government, the crisis rapidly came to a head. In reply to Mr Balfour's appeal for the sinking of differences (Newcastle, November 14), Mr Chamberlain insisted at Bristol (November 21) on the adoption of his fiscal policy; and Mr Balfour resigned on December 4, on the ground that he no longer retained the confidence of the party. At the crushing Unionist defeat in the general election which followed in January 1906, Mr Chamberlain was triumphantly returned for West Birmingham, and all the divisions of Birmingham returned Chamberlainite members. Amid the wreck of the party—Mr Balfour and several of his colleagues themselves losing their seats—he had the consolation of knowing that the tariff reformers won the only conspicuous successes of the election. But he had no desire to set himself up as leader in Mr Balfour's place, and after private negotiations with the ex-prime minister, a common platform was arranged between them, on which Mr Balfour, for whom a seat was found in the City of London, should continue to lead the remnant of the party. The formula was given in a letter from Mr Balfour of February 14th (see Balfour, A. J.) which admitted the necessity of making fiscal reform the first plank in the Unionist platform, and accepted a general tariff on manufactured goods and a small duty on foreign corn as "not in principle objectionable."

It may be left to future historians to attempt a considered judgment on the English tariff reform movement, and on Mr Chamberlain's responsibility for the Unionist débâcle of 1906. But while his enemies taunted him with having twice wrecked his party—first the Radical party under Mr Gladstone, and secondly the Unionist party under Mr Balfour—no well-informed critic doubted his sincerity, or failed to recognize that in leaving the cabinet and embarking on his fiscal campaign he showed real devotion to an ideal. In championing the cause of imperial fiscal union, by means involving the abandonment of a system of taxation which had become part of British orthodoxy, he followed the guidance of a profound conviction that the stability of the empire and the very existence of the monarchy of the United Kingdom depended upon a change of economic opinion to a revision of the current economic doctrine. There were doubtless miscalculations at the outset as to the resistance to be encountered. But from the purely party point of view he was entitled to say that he followed the path of loyalty to Mr Balfour which he had marked out from the moment of his resignation, and that he persistently refused to be put in competition with him as leader. Even in the absence of the new issue, defeat was foredoomed for Mr Balfour's administration by the ordinary course of political events; and it might fairly be claimed that "Chinese slavery," "passive resistance," and labour irritation at the Taft Vale judgment (see Trade Unions) were mainly responsible for the Unionist collapse. Time alone would show whether the system of free imports could be permanently reconciled with British imperial policy or commercial prosperity. It remained the fact that Mr Chamberlain staked an already established position on his refusal to compromise with his
CHAMBERLAIN, J. L.—CHAMBERLAIN

819

convictions on a question which appeared to him of vital and immediate importance.

Mr Chamberlain's own activity in the political field was cut short in the middle of the session of 1906 by a serious attack of gout, which was at first minimized by his friends, but which, it was gradually discovered, had completely crippled him. Though encouragement was given to the idea that he might return to the House of Commons, where he continued to retain his seat for Birmingham, he was quite incapacitated for any public work; and this invalid condition was protracted throughout 1907, 1908 and 1909. But he remained in the background as the inspirer and adviser of the Tariff Reformers. The cause made continuous headway at by-elections, and though the general election of January 1910 gave the Unionists no majority it saw them returned in much increased strength, which was chiefly due to the support obtained for tariff reform principles. Mr Chamberlain himself was returned unopposed for West Birmingham again.

(H. Ch.)

CHAMBERLAIN, JOSHUA LAWRENCE (1828— ), American soldier and educationalist, was born at Brewer, Maine, on the 8th of September 1838. He graduated at Bowdoin College in 1852, and at the Bangor Theological Seminary in 1855, and was in 1856-58 professor of rhetoric and oratory at Bowdoin. In 1860 he entered the Federal army as lieutenant-colonel of the 20th Maine Infantry. His military career was marked by great personal bravery and energy and intrepidity as a leader. He was six times wounded, and participated in all the important battles in the East from Antietam onwards, including Fredericksburg, Chancellorsville, Gettysburg, the Wilderness, Cold Harbor, Petersburg and Five Forks. For his conduct at Petersburg, where he was severely wounded, he was promoted to brigadier-general of volunteers. He was brevetted major-general of volunteers on the 20th of March 1865, and led the Federal advance in the final operations against General R. E. Lee. In 1863 he received a Congressional medal of honour "for daring heroism and great tenacity in holding his position on the Little Round Top and carrying the advance position on the Great Round Top at the Battle of Gettysburg." After the war he was again professor of rhetoric and oratory at Bowdoin, and in 1870 was governor of Maine, having been elected as a Republican. From 1871 to 1883 he was president of Bowdoin College, and during 1874-1879 was professor of mental and moral philosophy also. Appointed in 1886 by Alonzo Gore, the retiring governor, to protect the property and institutions of the state until a new governor should be duly qualified, and acting as major-general of the state militia, Chamberlain did much to avert possible civil war, at a time of great political excitement and bitter partisan feeling. (See Maine: History.) In 1883-1885 he was a lecturer on political science and public law at Bowdoin, and in 1900 became surveyor of customs for the district of Portland, Maine. He published Maine, Her Place in History (1877), and edited Universities and Their Sons (6 vols., 1868).

CHAMBERLAIN, SIR NIVELLE BOWLES (1820-1902), British field marshal, was the third son of Sir Henry Chamberlain, first baronet, consul-general and chargé d'affaires in Brazil, and was born at Rio on the 10th of January 1820. He entered the Indian army in 1837, served as a subaltern in the First Anglo-Burmese War (1824-26), and was wounded on six occasions. He was attached to the Governor-General's Bodyguard at the battle of Maharajpur, in the Gwadar campaign of 1843, was appointed military secretary to the governor of Bombay in 1846, and honorary aide-de-camp to the governor-general of India in 1847. He served on the staff throughout the Punjab campaign of 1848-49, and was given a brevet major. In 1850 he was appointed commandant of the Punjab military police, and in 1852 military secretary to the Punjab government. Promoted lieut.-colonel in 1854, he was given the command of the Punjab Frontier Force with rank of brigadier-general, and commanded in several expeditions against the frontier tribes. In the Indian Mutiny he succeeded Colonel Chester as adjutant-general of the Indian army, and distinguished himself at the siege of Delhi, where he was severely wounded. He was rewarded with a brevet-colonelcy, the appointment of A.D.C. to the queen, and the C.B. He was reappointed to the command of the Punjab Frontier Force in 1858, and commanded in the Umbeyla campaign (1863), in which he was severely wounded. He was now made major-general for distinguished service and a C.K.B. He was made K.C.S.I. in 1866, lieut.-general in 1872, G.C.S.I. in 1873, G.C.B. in 1875, and general in 1877. From 1876 to 1881 he was commander-in-chief of the Madras army, and in 1878 was sent on a mission to the amir of Afghanistan, whose refusal to allow him to enter the country precipitated the second Afghan War. He was for some time acting military member of the council of the governor-general of India. He retired in 1886, was made a field marshal in 1900, and died on the 18th of February 1902.

An excellent biography by G. W. Forrest appeared in 1909.

CHAMBERLAIN (O. Fr. chamberlain, chamberlenc, Mod. Fr. chamblèan, from O. H. Ger. Chamarling, Chamarline, whence also the Med. Lat. cambellanus, camellinys, camellengus; Ital. camerlingo; Span. camerlingo, compounded of O. H. Ger. Chamarling, Kamalings, Lat. camerlina, "chamber"); and the Ger. kameling, kameling, from the Lat. camerarius, from camerarius, also to a large extent synonymously, an officer charged with the superintendence of domestic affairs. Such were the chamberlains of monasteries or cathedrals, who had charge of the finances, gave notice of chapter meetings, and provided the materials necessary for the various services. In such cases, as in that of the apostolic chamberlain of the Roman see, the title was borrowed from the usage of the courts of the western secular princes. A royal chamberlain is now a court official whose function is in general to attend on the person of the sovereign and to regulate the etiquette of the palace. He is the representative of the medieval camballanus, camellans, or cubicularius, whose office was modelled on that of the praefectus sacri cubiculi or cubicularius of the Roman emperors. But at the outset there was another class of chamberlains, the camerarii, i.e. high officials charged with the administration of the royal treasury (camera). The camerarii of the Carolingian emperors was the equivalent of the hordo or thessaurarius (treasurer) of the Anglo-Saxon kings; he develops into the Erzböhmmer (archcamerarius) of the Holy Roman Empire, and later into the chambrier of the French royal household, who held his chamberie as a fief. Similarly in England after the Norman conquest the horder becomes the chamberlain. This office was of great importance. Before the Conquest he had been, with the marshal, the principal officer of the king's court; and under the Norman sovereigns his functions were manifold. As he had charge of the administration of the royal household, his office was of financial importance, for a portion of the royal revenue was paid, not into the exchequer, but in camera regis. In course of time the office became hereditary and titular, but the complexities of the duties necessitated a division of the work, and the office was split up into three: the hereditary and sinecure office of magister camerarium or lord great chamberlain (see Lord Great Chamberlain), the more important domestic office of camerarium regis, king's chamberlain or lord chamberlain (see Lord Chamberlain), and the chamberlains (camerarii) of the exchequer, two in number, who were originally representatives of the chamberlain at the exchequer, and afterwards in charge of the moneys of the exchequer. In 1826 the last of the exchequer officials died, when by an act passed forty-four years earlier they disappeared.

In France the office of grand chamberier was early overshadowed by the chamberlains (cubicularii, camellani, but sometimes also camerarii), officials in close personal attendance on the king, men at first of low rank, but of great and ever-increasing influence. As the office of grand chamberier, held by great feudal nobles seldom at court, became more and more honorary, the chamberlains grew in power, in numbers and in rank, until, in the 13th century, one of them emerged as a great officer of state, the chamberelin de France or grand chamberellan (also magister camballanorum, mestre chambrelin), who at times shares with the grand chamberier the revenues derived from certain
CHAMBERLAYNE—CHAMBERS, R.

820

trades in the city of Paris (see Regestum Memorialis Camerarii computorum, quoted in du Cange, s. Camerarius). The honorary office of grand chamberlain survived till the time of Henry II., who was himself the last to hold it before his accession; that of grand chambellan, which in its turn soon became purely honorary, survived till the Revolution. Among the prerogatives of the grand chamberlain which survived to the last not the least valued was the right to hand the king his shirt at the ceremonial levee. The offices of grand chambellan, premier chamberlain, and chamberlain were revived by Napoleon, continued under the Restoration, abolished by Louis Philippe, and again restored.

In the papal Curia the apostolic chamberlain (Lat. camerarius, Ital. camerlingo) occupies a very important position. He is at the head of the treasury (camera thesauraria) and, in the days of the temporal power, not only administered the papal finances but possessed an extensive civil and criminal jurisdiction. During a vacancy of the Holy See he is at the head of the administration of the Roman Church. The office dates from the 11th century, when it superseded that of archacon of the Roman Church, and was the chief personal relations of the camerarius with the pope, together with the fact that he is the official guardian of the ceremominal vestments and treasures, point to the fact that he is also the representative of the former restorarius and vice-dominus, whose functions were merged in the new office, of which the idea and title were probably borrowed from the usage of the secular courts of the West (Hinschius, Kirchenrecht, i. 405, &c.). There are also attached to the papal house (familia pontificia) a large number of chamberlains whose functions are more or less ornamental. These are divided into several categories: privy chamberlains (camerieri segreti), chamberlains, assistant and honorary chamberlains. These are gentlemen of rank and belong to the highest class of the household (familia nobile).

In England the modern representatives of the cubicularii are the gentlemen and grooms of the bed-chamber, in Germany the Kämmerherren (Kämmerer, from camerarius, in Bavaria and Austria) and Kammembucher. The insignia of their office is a gold key attached to their coats behind.

Many corporations appoint a chamberlain. The most important in England is the chamberlain of the corporation of the city of London, who is treasurer of the corporation, admits persons entitled to the freedom of the city, and, in the chamberlain's court, of which he and the vice-chamberlain are judges, exercises concurrent jurisdiction with the police court in determining disputes between masters and apprentices. Formerly nominated by the crown, since 1688 he has been elected annually by the livyermen. He has a salary of £2000 a year. Similarly in Germany the administration of the finances of a city is called the Kämmerer and the official in charge of it the Kämmerer.

"Camerarius" and "Cambiaelus"; Par Asnacne (Pierre de Guibours), Hist. généalogique et chronologique de la maison royale de France, &c. (9 vols., 3rd ed., 1726–1733); A. Luchaire, Manuel des institutions françaises (Paris, 1862); W. R. Anson, Biographical Dictionary of British Constitution (Oxford, 1896); Hinschius, Kirchenrecht, i. 405 (Berlin, 1860).

CHAMBERLAYNE, William (1610–1679), English poet, was born in 1619. Nothing is known of his history except that he practised as a physician at Shaftesbury in Dorsetshire, and fought on the Royalist side at the second battle of Newbury. He died on the 10th of July 1679. His works are: Phoronida (1639), a verse romance in five books; Love's Victory (1658), a tragi-comedy, acted under another title in 1678 at the Theatre Royal; England's Jubilee (1660), a poem in honour of the Restoration. A prose version of Phoronida, entitled Eromena, or the Noble Stranger, appeared in 1685. Southey speaks of him as "a poet to whom I am indebted for many hours of delight." Phoronida was reprinted by W. S. Singer in 1820, and again in 1905 by Prof. G. Saintsbury in Minor Poets of the Caroline Period (vol. i.). The poem is loose in construction, but contains some passages of great beauty.

CHAMBERS, Ephraim (d. 1740), English encyclopaedist, was born at Kendal, Westmorland, in the latter part of the 17th century. He was the noticed a physician at London, but, having conceived the plan of his Cyclopaedia, or Universal Dictionary of Arts and Sciences, he devoted himself entirely to it. The first edition appeared by subscription in 1728, in two vols. fol., and dedicated to the king (see Encyclopaedia). The Encyclopédie of Diderot and d'Alembert owed its inception to a French translation of Chambers's work. In addition to the Cyclopaedia, Chambers wrote for the Literary Magazine (1733–1736), and translated the History and Memoirs of the Royal Academy of Sciences at Paris (1742), and the Practice of Perspective from the French of Jean Dubreuil. He died on the 15th of May 1740.

CHAMBERS, George (1803–1840), English marine painter, born at Whitby, Yorkshire, was the son of a seaman, and for several years he pursued his father's calling. While at sea he was in the habit of sketching the different classes of vessels. His master, observing this, gratified him by cancelling his indentures, and thus set him free to follow his natural bent. Chambers then apprenticed himself to an old woman who kept a painter's shop in Whitby, and began by house-painting. He also took lessons of a drawing-master, and found a ready sale for small and cheap pictures of shipping. Coming afterwards to London, he was employed by Thomas Horner to assist in painting the great panorama of London for the Colosseum (the exhibition building in Regent's Park, demolished towards 1860), and he next became scene-painter at the Pavilion theatre. In 1834 he was elected an associate, and in 1836 a full member, of the Water-colour Society. His best works represent naval battles. Two of these—the "Bombardment of Algiers in 1816," and the "Capture of Porto Bello"—are in Greenwich hospital. Not long before his death he was introduced to William IV., and his professional prospects brightened; but his constitution, always frail, gave way, and he died on the 28th of October 1840.

A Life, by John Watkins, was published in 1841.

CHAMBERS, Robert (1802–1871), Scottish author and publisher, was born at Peebles on the roth of July 1802. He was sent to his local schools and gave evidence of unusual literary taste and ability. A small circulating library in the town, and a copy of the Encyclopaedia Britannica which his father had purchased, furnished him with stores of reading of which he eagerly availed himself. Long afterwards he wrote of his early years—"Books, not playthings, filled my hands in childhood. At twelve I was deep, not only in poetry and fiction, but in encyclopaedias." Robert had been destined for the church, but this design had to be abandoned for lack of means. The family removed to Edinburgh in 1813, and in 1818 Robert began business as a bookseller-keeper in Leith Walk. He was then only sixteen, and his whole stock consisted of a few old books belonging to his father. In 1819 his elder brother William had begun a similar business, and the two eventually united as partners in the publishing firm of W. & R. Chambers. Robert Chambers showed an enthusiastic interest in the history and antiquities of Edinburgh, and found a most congenial task in his Traditions of Edinburgh (2 vols., 1824), which secured for him a large circle of school and local society. In 1827, with Walter Scott, A History of the Rebellions in Scotland from 1638 to 1745 (5 vols., 1828) and numerous other works followed.

In the beginning of 1832 William Chambers started a weekly publication under the title of Chambers's Edinburgh Journal (known since 1854 as Chambers's Journal of Literature, Science and Arts), which speedily attained a large circulation. Robert was at first only a contributor. After fourteen numbers had appeared, however, he was associated with his brother as joint-editor, and his collaboration contributed more perhaps than anything else to the success of the Journal.

Among the other numerous works of which Robert was in whole or in part the author, the Biographical Dictionary of Eminent Scotsmen (4 vols., Glasgow, 1832–1833), the Cyclopaedia of English Literature (1844), the Life and Works of Robert Burns (4 vols., 1851), Ancient Sea Margins (1848), the Domestic Annals of Scotland (3 vols., 1859–1861) and The Book of Days (2 vols.,
CHAMBERS, SIR W.—CHAMBERS

1862–1864 were the most important. *Chambers's Encyclopaedia* (1859–1868), with Dr Andrew Findlater as editor, was carried out under the superintendence of the brothers (see *Encyclopaedia*). The *Cyclopaedia of English Literature* contains a series of admirably selected extracts from the best authors of every period, “set in a biographical and critical history of the literature itself.” For the *Life of Burns* he made diligent and laborious original investigations, gathering many hitherto unrecorded facts from the poet’s sister, Mrs Begg, to whose benefit the whole profits of the work were generously devoted. Robert Chambers was a scientific geologist, and availed himself of tours in Scandinavia and Canada for the purpose of geological exploration. The results of his travels were embodied in *Tracings of the North of Europe* (1851) and *Tracings in Iceland and the Faroe Islands* (1856). His knowledge of geology was one of the principal grounds on which the authorship of the *Vestiges of the Natural History of Creation* (2 vols., 1843–1844) was eventually assigned to him. The book was published anonymously. Robert Chambers was aware of the storm that would probably be raised at the time by a rational treatment of the subject, and did not wish to involve his firm in the discredit that a charge of heterodoxy would bring with it. The arrangements for publication were made through Alexander Ireland of Manchester, and the secret was so well kept that such different names as those of Prince Albert and Sir Charles Lyell were coupled with the book. Ireland in 1844 issued a 12th edition, with a preface giving an account of its authorship, which there was no longer any reason for concealing. The *Book of Days* was Chambers’s last publication, and perhaps his most elaborate. It was a miscellany of popular antiquities in connexion with the calendar, and it is supposed that his excessive labour in connexion with this book hastened his death, which took place at St Andrews on the 17th of March 1871. Two years before, the university of St Andrews had conferred upon him the degree of doctor of laws, and he was elected a member of the Athenaenum club in London. It is his highest claim to distinction that he did so much to give a healthy tone to the cheap popular literature which has become so important a factor in modern civilization.

His brother, *William Chambers* (1800–1883) was born at Peebles, on the 16th of April 1800. He was the financial genius of the publishing firm. He laid the city of Edinburgh under the greatest obligations by his public spirit and munificence. As lord provost he procured the passing in 1867 of the Improvement Act, which led to the reconstruction of a great part of the Old Town, and at a later date he proposed and carried out, largely at his own expense, the restoration of the neglected church of St Giles, making it in a sense the Westminster Abbey of Scotland.” This service was fitly acknowledged by the offer of a baronetcy, which he did not live to receive, dying on the 20th of May 1883, three days before the reopening of the church. He was the author of a history of St Giles’s, of a memoir of himself and his brother (1872), and of many other useful publications. On his death in 1883 Robert Chambers (1832–1888), son of Robert Chambers, succeeded as head of the firm, and edited the *Journal* until his death. His eldest son, Charles Edward Stuart Chambers (b. 1859), became editor of the *Journal* and chairman of W. & R. Chambers, Limited.

See also *Memoir of Robert Chambers, with Autobiographic Reminiscences of William Chambers* (1872), the 13th ed. of which (1884) has a supplement by Alexander Ireland’s preface to the 12th ed. (1884) of the *Vestiges of Creation*; the *Story of a Long and Busy Life* (1884), by William Chambers; and some discriminating appreciation in James Payn’s *Some Literary Recollections* (1884), chapter v. The *Select Writings of Robert Chambers* were published in 2 vols. in 1847, and a complete list of the works of the brothers is added to *A Catalogue of Some of the Rarer Books. . . in the Collection of C. E. S. Chambers* (Edinburgh, 1891).

CHAMBERS, SIR WILLIAM (1726–1796). British architect, was the grandson of a rich merchant who financed the armies of Charles XII, but was paid in base money, and whose son remained in Sweden many years endeavouring to obtain redress. In 1728 the latter returned to England and settled at Ripon, where William, who was born in Stockholm, was educated. At the age of sixteen he became supercargo to the Swedish East India Company, and voyaging to Canton made drawings of Chinese architecture, furniture and costume which served as basis for his *Designs for Chinese Buildings, &c.* (1753). Two years later he quitted the sea to study architecture seriously, and spent a long time in Italy, devoting special attention to the buildings of classical and Renaissance architects. He also studied under Clérisseau in Paris, with whom and with the sculptor Wilton he lived at Rome. In 1755 he returned to England with Cipriani and Wilton, and married the beautiful daughter of the latter. His first important commission was a villa for Lord Bessborough at Roehampton, but he made his reputation by the grounds he laid out and the buildings he erected at Kew between 1757 and 1762 for Augusta, Princess Dowager of Wales. Some of them have since been demolished, but the most important, the pagoda, still survives. The publication in a handsome volume of the designs for these buildings assured his position in the profession. He was employed to teach architectural drawing to the prince of Wales (George III.), and gained further professional distinction in 1759 by the publication of his *Treatise of Civil Architecture*. He began to exhibit with the Society of Artists in 1761 at Spring Gardens, and was one of the original members of the Royal Academy when it was established in 1768. In 1770 he published *The Delineator and Oriental Gardening*, which attempted to prove the inferiority of European to Chinese landscape gardening. As a furniture designer and interior decorator he is credited with the creation of that “Chinese Style” which was for a time furiously popular, although Thomas Chippendale (q.v.) had published designs in that manner at a somewhat earlier date. It is not unreasonable to count the honours as divided, since Chippendale unquestionably adapted and altered the Chinese shapes in a manner better to fit them for European use.

To the rage for every possible form of chinoiserie, for which he is chiefly responsible, Sir William Chambers owed much of his success in life. He became architect to the king and queen, comptroller of his Majesty’s works, and afterwards surveyor-general. In 1775 he was appointed architect of Somerset House, his greatest monument, at a salary of £2000 a year. He also designed town mansions for Earl Gower at Whitehall and Lord Melbourne in Piccadilly, built Charnel Mount House, Dublin, and Dudland House near Edinburgh. He designed the market house at Worcester, was employed by the earl of Pembroke at Wilton, by the Duke of Devonshire at Chatsworth and by the Duke of Bedford in Bloomsbury. The state coach of George III., his constant patron, was his work; it is now in the Victoria and Albert Museum. Although his practice was mainly Classic, he made Gothic additions to Milton Abbey in Dorset. Sir William Chambers achieved considerable distinction as a designer of furniture. In addition to his work in the Chinese style and in the contemporary fashions, he was the author of what is probably the most ambitious and monumental piece of furniture ever produced in England. This was a combined bureau, dressing-case, jewel-cabinet and organ, made for Charles IV., king of Spain, in 1793. These combination pieces were in the taste of the time, and the effort displays astonishing ingenuity and resource. The panels were painted by W. Hamilton, R.A., with representations of the four seasons, night and morning, fire and water, Juno and Ceres, together with representations of the Golden Fleece and the Immaculate Conception. The organ, in the domed top, is in a case decorated with ormulu and Wedgwood. This remarkable achievement, which possesses much sober elegance, formed part of the loan collection of English furniture at the Franco-British Exhibition in London in 1908. Sir William Chambers numbered among his friends Dr Johnson, Goldsmith, Sir Joshua Reynolds, David Garrick and Dr Burney.

CHAMBERS (the Fr. chambre, from Lat. camera, a room), a term used generally of rooms or apartments, but especially in law of the offices of a lawyer or the semi-private rooms in which judges or judicial officers deal with questions of practice and
other matters not of sufficient importance to be dealt with in court. It is a matter of doubt at what period the practice of exercising "chambers" commenced in England; there is no statutory sanction before 1821, though the custom can be traced back to the 17th century. An act of 1821 provided for sittings in chambers between terms, and an act of 1822 empowered the sovereign to call upon the judges by warrant to sit in chambers on as many days in vacation as should seem fit, while the Law Terms Act 1830 defined the jurisdiction to be exercised at chambers. The Judges' Chambers Act 1867 was the first act, however, to lay down proper regulations for chamber work, and the Judicature Act 1873 preserved that jurisdiction and gave power to increase it as might be directed or authorized by rules of court to be thereafter made. (See CHANCERY, King's Bench, Court of.)

CHAMBERSBURG, a borough and the county-seat of Franklin county, Pennsylvania, U.S.A., at the confluence of Conococheague Creek and Falling Spring, 52 m. S.W. of Harrisburg, Pop. (1890) 7863; (1900) 8864, of whom 769 were negroes; (1910) 11,800. It is served by the Cumberland Valley and the eastern Maryland railways, and connected by rail and roads with Greencastle, Waynesboro, California, a beautiful park in the Pennsylvania timber reservation, on South Mountain, 12 m. east of Chambersburg, and Pen Mar, a summer resort, on South Mountain, near the boundary line between Pennsylvania and Maryland. Chambersburg is built on an elevated site in the broad and fertile Cumberland Valley, and commands a fine view of the distant hills and dales. The borough is the seat of Chambersburg Academy, a preparatory school; Penn Hall, a school for girls; and Wilson College, a Presbyterian institution for women, opened in 1870. The Wilson College campus, the former estate of Col. A. K. McClure (1828-1909), a well-known journalist, was laid out by Donald G. Mitchell ("'Ik Marvel"), who was an enthusiastic landscape gardener. The shops of the Cumberland Valley railway are at Chambersburg, and among the borough's manufactures are milling machinery, boilers, engines, hydraulic presses, steam-hammers, engineering and bridge supplies, dry goods, shoes, gloves, furniture, flour, paper, leather, carriages and agricultural implements; the total value of its factory product in 1905 was $1,085,185. The waterworks and the electric-lighting plant are owned and operated by the municipality. A settlement was founded here in 1730 by Benjamin Chambers, in whose honour the borough was named, and who, immediately after General Edward Braddock's defeat in 1755, built a stone fort and surrounded it with a stockade for the protection of the community from the Indians. Chambersburg was laid out in 1764 and was incorporated as a borough in 1803. On the 30th of July 1864, Chambersburg was occupied by a Confederate cavalry force under General McCausland (acting under General Jubal A. Early's orders), who, upon the refusal of the citizens to pay $100,000 for immunity, burned a large part of the borough.

CHAMBÉRY, a city of France, capital of the department of Savoie, pleasantly situated in a fertile district, between two hills, the river Lysse and Albene, 79 m. by rail S.W. of Geneva. Pop. (1861) 16,822; commune, 23,027. The town is irregularly built, and has only two good streets—the Place Saint-Léger and the Rue de Boigne, the latter being named after General Benoît Boigne (1741-1830), who left a fortune of 3,400,000 francs (accumulated in India) to the town. The principal buildings are the cathedral, dating from the 14th and 15th centuries; the Hôtel-Dieu, founded in 1647; the castle, a modern building serving as the prefecture, and preserving only a great square tower belonging to the original structure; the palace of justice, the theatre, the barracks, and the covered market, which dates from 1863. Several of the squares are adorned with fountains; the old ramparts of the city, destroyed during the French Revolution, have been converted into public walks; and various promenades and gardens have been constructed. Chambéry is the seat of an archbishop (raised to that dignity from a bishopric in 1817) and of a superior tribunal. It has also a Jesuit college, a royal academical society, a society of agriculture and commerce, a public library with 60,000 volumes, a museum (antiquities and paintings), a botanical garden, and many charitable institutions. 131 measures without spagoze, lace, leather and hats, and has a considerable trade in liqueurs, wine, lead, copper and other articles. Overlooking the town on the north is the Rocher de Lémenç, which derives its name from the Lémicon of the Romans; and in the vicinity is Les Charmettes, for some time (1756-1760) the residence of Rousseau.

The origin of Chambéry is unknown, but its lords are mentioned for the first time in 1029. In 1232 it was sold to the count of Savoy, Thomas I, who bestowed several important privileges on the inhabitants. As capital of the duchy of Savoy, it has passed through numerous political vicissitudes. Between 1536 and 1713 it was several times occupied by the French; in 1742 it was captured by a Franco-Spanish army; and in 1792 it was occupied by the Republican forces, and became the capital of the department of Mont Blanc. Restored to the house of Savoy by the treaties of Vienna and Paris, it was again surrendered to France in 1860. Among the famous men whom it has given to France, the most important are Vaugelas (1585-1659), Saint-Réal (1659-1702), and the brothers Joseph (1754-1821) and Xavier (1753-1823) de Maistre.

CHAMBORD, HENRI CHARLES FERDINAND MARIE DÉJOUONNÉ, COMTE DE (1820-1883), the "King Henry V." of the French legitimists, was born in Paris on the 29th of September 1820. His father was the duc de Berry, the elder son of the comte d'Artois (afterwards Charles X.); his mother was the princess Caroline Ferdinande Louise of Naples. Born seven months after the assassination of his father, he was hailed as the "enfant du miracle," and was made the subject of one of Lamartine's most famous poems. He was created duc de Bordeaux, and in 1821, as the result of a subscription organized by the government, received the château of Chambord. He was educated by tutors inspired by detestation of the French Revolution and its principles, and from the duc de Duras in particular imbibed those ideas of divine right and of devotion to the Church to which he always remained true. After the revolution of July, Charles X. vainly endeavored to save the Bourbon cause by abdicating in his favour and proclaiming him king under the title of Henry V. (August 2, 1830). The comte de Chambord accompanied his grandfather into exile, and resided successively at Holyrood, Prague, and Görlitz. In 1841, during an extensive tour through Europe, he broke his leg—an accident that resulted in permanent lameness. The death of his grandfather, Charles X., in 1836, and of his uncle, the duc d'Angoulême, in 1844, left him the last male representative of the elder branch of the Bourbon family; and his marriage with the archduchess Maria Theresa, eldest daughter of the duke of Modena (November 7, 1846), remained without issue. The title to the throne thus passed to the comte de Paris, as representative of the Orleans branch of the house of Bourbon, and the history of the comte de Chambord's life is largely an account of the efforts made to unite the Royalist party by effecting a reconciliation between the two princes. Though he continued to hold an informal court, both on his travels and at his castle of Frohsdorf, near Vienna, yet he allowed the revolution of February 1848, the coup d'état of the 2d of December 1851, and the subsequent assumption of power by Napoleon III to do nothing but assert his claims. It was the Italian war of 1859, with its menace to the pope's independence, that roused him at last to activity. He declared himself ready "to pay with his blood for the triumph of a cause which was that of France, the Church, and God himself." Making common cause with the Church, the Royalists now began an active campaign against the Empire. On the 9th of December 1866 he addressed a manifesto to General Saint-Priest, in which he declared the cause of the pope to be that of society and liberty, and held out promises of retribution, civil and religious liberty, "and above all honesty." Again, on the 4th of September 1870, after the fall of the Empire, he invited Frenchmen to accept a government "whose basis was right and whose principle was honesty," and promised to drive the enemy from French soil. These vague phrases, offered as a panacea to a nation fighting for its life, showed conclusively his want of all political genius; they had as little effect on the French as his
protest against the bombardment of Paris had on the Germans. Yet fortune favoured him. The elections placed the Republican party in a minority in the National Assembly; the abrogation of the law of exile against the royal family permitted him to return to his castle of Chambord; and it was thence that on the 5th of July 1871 he issued a proclamation, in which for the first time he publicly posed as king, and declared that he would never abandon the white standard of the Bourbons, "the flag of Henry IV., Francis I., and Joan of Arc," for the tricolour of the Revolution. He again quit France, and answered the attempts to make him renounce his claims in favour of the comte de Paris by the declaration (January 25, 1872) that he would never abdicate. In the following month he held a great gathering of his adherents at Antwerp, which was the cause of serious disturbances. A constitutional programme, signed by some 280 members of the National Assembly, was presented for his acceptance, but without result. The fall of Thiers in May 1873, however, offered an opportunity to the Republicans by which he hastened to profit. The comte de Paris and the prince de Joinville journeyed to Frohdsdorf, and were formally reconciled with the head of the family (August 5). The Royalists were united, the premier (the duc de Broglie) an open adherent, the president (MacMahon) a benevolent neutral. MM. Lucien Brun and Chesnelong were sent to interview the comte de Chambord at Salzburg, and obtain the definite assurances that alone were wanting. They returned with the news that he accepted the principles of the French Revolution and the tricolour flag. But a letter to Chesnelong, dated Salzburg, 27th of October, declared that he had been misunderstood; he would give no guarantees; he would not inaugurate his reign by an act of weakness, nor become "le roi légitime de la Révolution." "Je suis le pilote nécessaire," he added, "le seul capable de conduire ce navire au port, parce que j'ai mission et autorité pour cela." This outspoken adherence to the principles of divine right did credit to his honesty, but it cost him the crown. The duc de Broglie carried the secession, and the Republic steadily established itself in popular favour. A last effort was made in the National Assembly in June 1874 by the duc de la Rochefoucauld-Bisaccia, who formally moved the restoration of the monarchy. The comte de Chambord on the 2nd of July issued a fresh manifesto, which added nothing to his former declarations. The motion was rejected by 272 to 79, and on the 25th of February 1875 the Assembly definitely adopted the Republic as the national form of government. From this time the comte de Chambord, though continuing to publish letters on political affairs, made no further effort to regain the throne. He died at Frohdsdorf on the 24th of August 1883.

See Manifestes et programmes politiques de M. le comte de Cham- bord (1873, 1875), and Correspondance de la famille royale et principalement de Mgr. le comte de Chambord avec le comte de Bouillé (1884). Of the enormous literature relating to him, mention may be made of Henri V et la monarchie traditionnelle (1871), Le Comte de Chambord et la monarchie traditionnelle (1873), Henri de France, by H. de Pène (1885). (H. S.V.)

CHAMBORD, a village of central France, in the department of Loir-et-Cher, on the left bank of the Cosson, 16 m. E. by N. of Blois by road. The village stands in the park of Chambord, which is enclosed by a wall 21 m. in circumference. The celebrated château (see Architecture: Renaissance Architecture in France) forms a parallelogram flanked at the angles by round towers and enclosing a square block of buildings, the façade of which forms the centre of the main front. The profusion of turrets, pinnacles, and dormer windows which decorates the roof of this, the chief portion of the château, constitutes the main feature of the exterior, while in the interior is a well-preserved chapel of the 16th century and a famous double staircase, the construction of which permits two people to ascend and descend respectively without seeing one another. There are several apartments, containing pictures of the 17th century and souvenirs of the comte de Chambord. The château was originally a hunting-box of the counts of Blois, the rebuilding of which was begun by Francis I. in 1526, and completed under Henry II. It was the residence of several succeeding monarchs, and under Louis XIV. considerable alterations were made. In the same reign Mollière performed Monsieur de Pourceaugnac and Le Bourgeois gentilhomme for the first time in the theatre. Stanislaus, king of Poland, lived at Chambord, which was bestowed by his son-in-law, Louis XV., upon Marshal Saxe. It was given by Napoleon to Marshal Berthier, from whose widow it was purchased by subscription in 1821, and presented to the duc de Bordeaux, the representative of the older branch of the Bourbons, who assumed from it the title of comte de Chambord. On his death in 1883 it came by bequest into the possession of the family of Parma.

CHAMBRE ARDENTE (Fr. "burning chamber"), the term for an extraordinary court of justice in France, mainly held for the trials of heretics. It is perhaps an allusion to the fact that the proceedings took place in a room from which all daylight was excluded, the only illumination being from torches, or there may be a reference to severity of the sentences in antie, suggesting the burning of the prisoners at the stake. These courts were originated by the Cardinal of Lorraine, the first of them meeting in 1553 under Francis I. The Chambre Ardente co-operated with an inquisitorial tribunal also established by Francis I., the duty of which was to discover cases of heresy and hand them over for final judgment to the Chambre Ardente. The reign of Henry II. of France was particularly infamous for the cruelties perpetrated by this court on the Huguenots. The marquis de Brinvilliers (q.v.) and her associates were tried in the Chambre Ardente in 1680. The court was abolished in 1682.

See N. Weiss, La Chambre Ardente (Paris, 1889), and F. Ravaisson, Archives de la Bastille (Paris, 1860-1884, 16 vols.).

CHAMELEON, the common name of one of the three suborders of Lacertilia or lizards. The chief genus is Chamaeleo, containing most of the fifty to sixty species of the whole group, and with the most extensive range, from Africa through Madagascar into Arabia, southern India and Ceylon. The Indian species is Ch. calcaratus; the dwarf chameleon of South Africa is Ch. pumilus; the giant of the whole tribe, reaching a total length of 2 ft., is Ch. parsoni of Madagascar. The commonest species in the trade is Ch. vulgaris of North Africa, introduced into southern Andalusia. A few queer genera, with much stunted tail, e.g. Rhampholeon, in tropical Africa and Brookesia in Madagascar are the most aberrant. The common chameleon is the most typical. The head is raised into a pyramidal crest far beyond the occiput, there is no outer ear, nor a drum-cavity. The limbs are very long and slender, and the four front stout grasping bundles; on the hand the first three form an inner bundle, opposed to the remaining two; on the foot the inner bundle is formed by the first and second toe, the outer by the other three toes. The tail is prehensile, by being rolled downwards; it is not brittle and cannot be renewed. The eyeballs are large, but the lids are united into one concentric fold, leaving only the small pupil visible. The right and left eyes are incessantly moved separately from each other and literally in every direction, up and down, forwards and straight backwards, producing the most terrible squinting. Chameleons alone of all reptiles can focus their eyes upon one spot, and conformably they alone possess a retinal macula centralis, or spot of acute, binocular vision. The tongue has attained an extraordinary development. It is club-shaped, covered with a sticky secretion, and upon a very narrow root, which is composed of extremely elastic fibres, and telescoped over the much elongated, style-shaped, copular piece of the hyoid. The whole apparatus is kept in a contracted state like a spring in a tube. When the spring is released, so to speak, by filling the apparatus with blood and by the play of the hyoid muscles, the heavy thick end shoots out upon the insect prey and is withdrawn by its own elasticity. Left Forefoot of Chameleon o' shaghenesti, outer view.
CHAMFER

The whole act is like a flash. An ordinary chameleon can shoot a fly at the distance of fully 6 in., and it can manage even a big sphinx moth.

Another remarkable feature is their changing of colour. This proverbial power is greatly exaggerated. They cannot assume in succession all the colours of the rainbow, nor are the changes quick. The common chameleon may be said to be greenish grey, changing to grass-green or to dull black, with or without maroon red, or brown, lateral series of patches. At night the same specimen assumes as a rule a more or less uniform pale straw colour. After it has been watched for several months, when all its possibilities seem exhausted, it will probably surprise us by a totally new combination, for instance, a black garb with many small yellow specks, or green with many black specks. Pure red and blue are not in the register of these species, but they are rather the rule upon the dark green ground colour of the South African dwarf chameleon. The changes are partly under control of the will, partly complicated reflex actions, intentionally adaptive to the physical and psychical surroundings. The mechanism is as follows. The cutis contains several kinds of specialized cells in many layers, each filled with minute granules of guanine. The upper cells are the smallest, most densely filled with crystals, and cause the white colour by diffusion of direct light; near the Malpighian layer the cells are charged with yellow oil drops; the deeper cells are the largest, tinged light brown, and acting as a turbid medium they cause a blue colour, which, owing to the superimposed yellow drops, reaches our eye as green; provided always that there is an effective screen at the back, and this is formed by large chromatophores which lie at the bottom and send their black pigment half-way up, or on to the top of the layers of guanine and oil containing cells. When all the pigment is shifted towards the surface, as near the epidermis as possible, the creature looks black; when the black pigment is withdrawn into the basal portions of the chromatophores the skin appears yellow.

The lungs are very capacious, and extend in several narrow blind sacs which extend far down into the body cavity, so that not only the chest but the whole body can be blown up. This happens when the animals hiss and fight, as they often do. But when they know themselves discovered, they make themselves as thin as possible by compressing the chest and belly vertically by means of their peculiarly elongated ribs. The whole body is then put into such a position that it presents only its narrow edge to the enemy, and with the branch of the tree or shrub interposed. They are absolutely arboreal, but they hibernate in the ground.

The usual mode of propagation is by eggs, which are oval, numerous, provided with a calcareous shell, and buried in humus, whence they are hatched about four months later. But a few species, e.g. the dwarf chameleon, are viviparous.

Chameleons are insectivorous. They prefer locusts, grasshoppers and lepidoptera, but are also fond of flies and mealworms. They are notoriously difficult to keep in good health. They want plenty of water, and they must have water, which they lick up from drops from the edges of leaves, and only when they have a chance. The sillsiness of the faile that they live on air is shown by the fact that they usually die in an absolutely emaciated and parched condition after three or four months' starvation.

(H. F. G.)

In astronomy, "Chamaeleon" is a constellation situated near the south pole and surrounded by the constellations of Octans, Mensa, Piscis volans, Carina (Nauta), Musca and Apus. In chameleons, the general "chamfer" is said to be the edge of the calcareous shell which is obtained when pyrolusite (manganese dioxide) is fused with nitre, since a solution in water assumes a purple tint on exposure to the air; this change is due to the oxidation of the manganate, which is first formed, to a permanganate.

CHAMFORT, CHAPPEY OR CHAUMPER (Fr. chapney; possibly from Lat. cantare, to sing, and frangere, to break), an architectural term; when the edge or ariss of any work is cut off at an angle of 45° in a small degree, it is said to be "chamfered," while it would be "canted" if on a large scale. The chamfer is much used in medieval work, and is sometimes plain, sometimes hollowed out and sometimes moulded. Chamfers are sometimes "stopped" by a bead or some moulding, but when cut short by a slope they are generally known as "stop chamfer."

CHAMFORT, SEBASTIEN ROCH NICOLAS (1741-1794). French man of letters, was born at a little village near Clermont in Auvergne in 1741. He was, according to a baptismal certificate found among his papers, the son of a grocer named Nicolas. A journey to Paris resulted in the boy's obtaining a bursary at the Collège des Grasins. He worked hard, although he wrote later in one of his most contemptuous epigrams—"Ce que j'ai appris je ne le sais plus; le peu que je sais je l'ai dévint." His college career ended, Chamfort assumed the dress of a petit abbé. "C'est un costume, et non point un état," he said; and to the principal of his college who promised him a benefice, he replied that he would never be a priest, inasmuch as he preferred honour to honours—"j'aime l'honneur et non les honneurs." About this time he assumed the name of Chamfort.

For some time he contrived to exist by teaching and as a bookseller's hack. His good looks and ready wit, however, soon brought him into notice; but though endowed with immense strength—"Hercule sous la lune, l'adolescent," Madame de Caermon called him—he lived so hard that he continued to be doing a "cure" at Spa when the Belgian minister in Paris, M. van Eyck, took him with him to Germany in 1761. On his return to Paris he produced a comedy, Le Journe Indienne (1764), which was performed with some success, and this was followed by a series of "epistles" in verse, essays and odes. It was not, however, until 1769, when he won the prize of the French Academy for his Éloge on Molière, that his literary reputation was established.

Meanwhile he had lived from hand to mouth, mainly on the hospitality of people who were only too glad to give him board and lodging in exchange for the pleasure of the conversation for which he was famous. Thus Madame Helvétius entertained him at Sèvres for some years. In 1770 another comedy, Le Marchand de Smyrne, brought him still further into notice, and he seemed on the road to fortune, when he was suddenly smitten with a horrible disease. His distress was relieved by the generosity of a friend, who made over to him a pension of 1200 livres charged on the Mercure de France. With this assistance he was able to go to the baths of Contrexeville and to spend some time in the country, where he wrote an Éloge on La Fontaine which won the prize of the Academy of Mâlles (1774). In 1775, while taking the waters at Barèges, he met the duchesse de Grammont, sister of Choiseul, through whose influence he was introduced at court.

In 1776 his poor tragedy, Mustapha et Zeongir, was played at Fontainebleau before Louis XVI. and Marie Antoinette; the king gave him a further pension of 1200 livres, and the prince de Condé made him his secretary. But he was a Bohemian naturally and by habit, the restraints of the court irked him, and with increasing years he was growing misanthropical. After a year he resigned his post in the prince's household and retired into solitude at Auteuil. There, comparing the authors of old with those of his own time, he uttered the famous mot that proclaims the superiority of the dead; in doing so he came to love his ancient masters as companions; and there too he presently fell in love. The lady, attached to the household of the duchesse du Maine, was forty-eight years old, but clever, amusing, a woman of the world; and Chamfort married her. They left Auteuil, and went to Vaucouleurs, where in six months Madame Chamfort died. Chamfort lived in Holland for a time with M. de Narbonne, and returning to Paris received in 1781 the place at the Academy left vacant by the death of La Curne de Sainte-Palaye, the author of the Dictionnaire des antiquités françaises. In 1784, through the influence of Calonne, he became secretary to the king's sister, Madame Elizabeth, and in 1786 he received a pension of 2000 livres from the royal treasury. He was thus once more attached to the court, and made himself friends in spite of the reach and tendency of his unalterable irony; but he quitted it for ever after an unfortunate and mysterious love affair, and was received into the house of M. de Vaudreuil. Here in 1783 he had met Mirabeau, with whom he remained to the last on terms of intimate friendship.
CHAMIÉR—CHAMISSO

whom he assisted with money and influence, and one at least of whose speeches—that on the Academies—he wrote.

The outbreak of the Revolution made a profound change in the relations of Chamier's life. Theoretically he had long been a republican, and he now threw himself into the new movement with almost fanatical ardour, devoting all his small fortune to the revolutionary propaganda. His old friends of the court he forgot. "Those who pass the river of revolutions," he said, "have passed the river of oblivion." Until the 3rd of August 1791 he was secretary of the Jacobin club; he became a street orator and entered the Bastille among the first of the storming party.

He worked for the "Mercure de France," collaborated with Gigné in the "Feuille villageoise," and drew up for Talleyrand's "Adresse au peuple français."

With the reign of Marat and Robespierre, however, his uncompromising Jacobinism grew critical, and with the fall of the Girondins his political life came to an end. But he could not restrain the tongue that had made him famous; he no more spared the Convention than he had spared the court. His notorious republican failed to excuse the excursions he lavished on the new order of things, and denounced by an assistant in the Bibliothèque Nationale, to a share in the direction of which he had been appointed by Roland, he was taken to the Maconnettes. Released for a moment, he was thereupon again with arrest, and he was placed under a régime of physical and mental restraint to which he had been exposed. He attempted suicide with pistol and with pawniard; and, horribly hacked and shattered, dictated to those who came to arrest him the well-known declaration—"Moi, Sébastien-Roch-Nicolas Chamfort, déclare avoir voulu mourir en homme libre plutôt que d'être reconduit en esclavage dans une maison d'arrêt"—which he signed in a firm hand and in his own blood. He did not die at once, but lingered until the 13th of April 1794 in charge of a gendarme, for whose wardship he paid a crown a day.

To the Abbé Sieyès Chamfort had given fortune in the title of a pamphlet ("Est-ce que le Tiers-État est tout? Qu'a-t-il? Rien"), and to Sieyès did Chamfort retaliate his supreme sarcasm, the famous "Je m'en vais enfin de ce monde où il faut que le cœur se brise ou se bronze." The maker of constitutions followed the dead wit to the grave.

The writings of Chamfort, which include comedies, political articles, literary criticisms, portraits, letters, and verses, are colourless and uninteresting in the extreme. As a talker, however, he was of extraordinary force. His Maximes, sayings, highly prized by Joseph Stuart even in after those of La Rochefoucauld, the most brilliant and suggestive sayings that have been given to the modern world. The aphorisms of Chamfort, less systematic and psychologically less important than those of La Rochefoucauld, are as significant in their violence and iconoclastic spirit of the period of storm and preparation that gave them birth as the Réflexions in their exquisite restraint and elaborate subtlety are characteristic of the tranquil elegance of their epoch; and they have the advantage in richness of colour, in picturesqueness of phrase, in passion, in audacity. Sainte-Beuve compares them to "well-minted coins that retain their value," and to keen arrows that "arrivent brusquement et siflett encore."

An edition of his works—"Oeuvres complètes de Nicolas Chamfort"—was published at Paris in five volumes in 1824-1826. Selections "Oeuvres de Chamfort"—in one volume, appeared in 1852, with a biographical and critical preface by Arène Houssaye, reprinted from the "Revue des deux mondes;" and "Oeuvres choisies" (2 vols.), with a preface and notes by M. de Lescure (1879). See also Sainte-Beuve, "Chamier du monde" (1857).

CHAMIER, FREDERICK (1756-1870), English novelist, was the son of an Anglo-Indian official. In 1809 he entered the navy, and was in active service until 1827. He retired in 1833, and was promoted to be captain in 1850. On his retirement he settled near Waltham Abbey, and wrote several nautical novels on the lines popularized by Marryat, that had considerable success. These were The Life of a Sailor (1832), Ben Brake (1836), The Arethusa (1837), Jack Adams (1838), Tom Bowling (1841) and Jack Malcolm's Log (1840). He wrote a number of other
CHAMKANNI—CHAMOIS

His family were shortly afterwards permitted to return to France; he, however, remained behind and continued his career in the army. He had but little education, but now sought distraction from the soulless routine of the purchasing of his regiment in a dissolute study. In collaboration with Varnhagen von Ense, he founded in 1803 the *Berliner Musenalmanach*, in which his first verses appeared. The enterprise was a failure, and, interrupted by the war, it came to an end in 1806. It brought him, however, to the notice of many of the literary celebrities of the day and established his reputation as a rising poet. He had been lieutenant in 1801, and in 1805 accompanied his regiment to Hameln, where he shared in the humiliations following the treasonable capitulation of that fortress in the ensuing year. Placed on parole he went to France, where he found that both his parents were dead; and, returning to Berlin in the autumn of 1807, he obtained his release from the service early in the following year. Homeless and without a profession, disilluminated and despondent, he lived in Berlin until 1810, when, through the services of an old friend of the family, he was offered a professorship at the lyceé at Napoléonville in La Vendée. He set out to take up the post, but drawn into the charming circle of Madame de Staël, followed her in her exile to Coppet in Switzerland, where, devoting himself to botanical research, he remained nearly two years. In 1812 he returned to Berlin, where he continued his scientific studies. In the summer of the eventful year, 1813, he wrote the prose narrative *Peter Schlemil,* the man who sold his shadow. This, the most famous of all his works, has been translated into most European languages (English by W. Howitt). It was written partly to divert his own thoughts and partly to amuse the children of his friend Hitzig. In 1815 Chamisso was appointed botanist to the Russian ship "Rurik," which Otto von Kotzebue (son of August von Kotzebue) commanded on a scientific voyage round the world. His diary of the expedition (*Tagebuch, 1821*) affords some interesting glimpses of England and English life. On his return in 1818 he was made custodian of the botanical gardens in Berlin, and, was elected a member of the Academy of Sciences, and in 1820 he married. Chamisso's travels and scientific researches strained for a while the full development of his poetical talent, and it was not until his forty-eighth year that he turned again to literature. In 1829, in collaboration with Gustav Schwab, and from 1832 in conjunction with Franz von Gaudy, he brought out the *Deutsche Musenalmanach*, in which his later poems were mainly published. He died on the 21st of August 1838.

As a scientist Chamisso has not left much mark, although his *Bemerkungen und Ansichten*, published in an incomplete form in O. von Kotzebue's *Entdeckungsreise* (Wemar, 1821) and more completely in Chamisso's *Gesammelte Werke* (1836), and the botanical work on the "Hornussen und schildlichsten Gewässern in Norddeutschland* (1829) are esteemed for their careful treatment of the subjects with which they deal. As a poet Chamisso's reputation stands high, *Frauen Liebe und Leben* (1839), a cycle of lyrical poems, which was set to music by Schumann, being particularly famous. Noteworthy are also *Schloss Boncourt* and *Salas y Gomes*. In estimating his success as a writer, it should not be forgotten that he was cut off from his native speech and from his natural current of thought and feeling. He often deals with gloomy and sometimes with ghastly and repulsive subjects; and even in his lighter and gayer prodictions there is an undertone of sadness or of satire. In the lyrical expression of the domestic emotions he displays a fine felicity, and he knew how to treat with true feeling a tale of love or vengeance. *Die Löwenbraut* may be taken as a sample of his weird and powerful simplicity; and *Vergeltung* is remarkable for a pitiless precision of treatment.

The first collected edition of Chamisso's works was edited by J. E. Hitzig, 6 vols. (1835); 6th edition (1874); there are also excellent editions by M. Koch (1885) and O. F. Walzel (1892). On Chamisso's life see J. E. Hitzig, "Leben und Werke von Adelbert von Chamisso" (in the *Gesammelte Werke*); K. Fuld, *Chamisso und seine Zeit* (1881); G. Hofmeister, *Adelbert von Chamisso* (1884); and, for the scientific side of Chamisso's life, E. du Bois-Raymond, *Adelbert von Chamisso als Naturforscher* (1889).

CHAMKANNI, a small Pathan tribe on the Kohat border of the North-West Province of India. They inhabit the western part of the Kumaon Valley, a part thickly peopled by the Tirah, but are supposed to be a distinct race. They took part in the frontier risings of 1897, and during the Tirah expedition of that year a brigade under General Gaselee was sent to punish them.

CHAMOIS, the Franco-Swiss name of an Alpine ruminant known in the German cantons as *Geme*, and to naturalists as *Rupicapra rupicapra* or *R. rupicapra rupicapra*. It is the only species of its genus, and typifies a subfamily, *Rupicaprinae*, of hollow-horned ruminants in some degree intermediate between antelopes and goats (see ANTELOPE). About equal in height to a roebuck, and with a short black tail, the chamois is readily distinguishable from all other ruminants by its vertical, backwardly-hooked, black horns, which are common to males and females, although smaller in the latter. Apart from black and white face-markings, and the black tail and dorsal stripe, the prevailing colour of the Alpine chamois is chestnut brown in summer, but lighter and greyer in winter. In the Pyrenees the species is represented by a small race locally known as the izard; a very brightly-coloured form, *R. t. picta*, inhabits the Appenines; the Carpathian chamois is very dark-coloured, and the one from the Caucasus is the representative of yet another race. A thick under-fur is developed in the winter-coat, as in all other ruminants dwelling at high altitudes. Chamois are gregarious, living in herds of 15 or 20, and feeding generally in the morning or evening. The old males, however, live alone except in the rutting season, which occurs in October, when they join the herds, driving off the younger bucks, and engaging in fierce contests with each other, that often end fatally for one at least of the combatants. The period of gestation is twenty weeks, when the female, beneath the shelter generally of a projecting rock, produces one and sometimes two young. In summer they ascend to the limits of perpetual snow, being only exceeded in the loftiness of their haunts by the ibex; and during that season they show their intolerance of heat by choosing such browsing-grounds as have a northern exposure. In winter they descend to the wooded districts that immediately succeed the region of glaciers, and it is there only they can be successfully hunted. Chamois are exceedingly shy; and their senses, especially those of sight and smell, very acute. The herd never feeds without having a sentinel posted on some prominence to give notice of the approach of danger; which is done by stamping on the ground with the forefeet, and uttering a shrill whistling note, thus putting the entire herd on the alert. No sooner is the object of alarm scented or seen than each one seeks safety in the most inaccessible situations, which are often reached by a series of astounding leaps over crevasses, up the faces of seemingly perpendicular rocks, or down the sides of equally precipitous chasms. The chamois will not hesitate, it is said, thus to leap down 20 or even 30 ft., and this it effects with apparent ease by throwing itself forward diagonally and striking its feet several times in its descent against the face of the rock. Chamois-shooting is most successfully pursued when a number of hunters form a circle round a favourite feeding ground, which they gradually narrow; the animals, scenting the hunters to windward, fly in the opposite direction, only to encounter those coming from leeward. Chamois-hunting, in spite of, or perhaps owing to the great danger attending it, has always been a favourite pursuit among the hardy mountaineers of Switzerland and Tirol, as well as of the amateur sportsmen of all countries, with the result that the animal is now comparatively rare in many districts where it was formerly common. Chamois feed in summer on mountain-herbs and flowers, and in winter chiefly on the young shoots and buds of fir and pine trees. They are particularly fond of *Salix* and in the Alps sandstone rocks containing a saline impregnation are often met with hollowed by the constant licking of these creatures. The skin of the chamois is very soft; made into leather it was the original *shemmy*, which is now made, however, from the skins of many other animals. The flesh is prized as venison. (R. L.*)
CHAMOMILE—CHAMPAGNE

CHAMOMILE, or CAMOMILE FLOWERS, the flores anthemidis of the British Pharmacopoeia, the flower-heads of Anthemis nobilis (Nat. Ord. Compositae), a herb indigenous to England and western Europe. It is cultivated for medicinal purposes in Surrey, at several places in Saxony, and in France and Belgium,—that grown in England being much more valuable than any of the foreign chamomiles brought into the market. In the wild plant the florets of the ray are ligulate and white, and contain pistils only, those of the disk being tubular and yellow; but under cultivation the whole of the florets tend to become ligulate and white, in which state the flower-heads are said to be double. The flower-heads have a warm aromatic odour, which is characteristic of the entire plant, and a very bitter taste. In addition to a bitter extractive principle, they yield about 2% of a volatile liquid, which on its first extraction is of a pale blue colour, but becomes a yellowish brown on exposure to light. It has the characteristic odour of the flowers, and consists of a mixture of butyl and amyl angelates and valerates. Angelate of potassium has been obtained by treatment of the oil with caustic potash, and anisic acid may be isolated from this by treatment with dilute sulphuric acid. Chamomile is often used as an emetic. It is cultivated in the form of its volatile oil, of which the dose is 3-5 minimis. There is an official extract which is never used. Like all volatile oils the drug is a stomachic and carminative. In large doses the infusion is a simple emetic.

Wild chamomile is Matricaria chamomilla, a weed common in waste and cultivated ground especially in the southern counties of England. It has somewhat the appearance of true chamomile, but a fainter scent.

CHAMONIX, a mountain valley in south-east France, its chief village, of the same name, being the capital of a canton of the arrondissement of Bonneville in the department of Haute-Savoie. The valley runs from N.E. to S.W., and is watered by the Arve, which rises in the Mer de Glace. On the S.E. towers the snow-capped chain of Mont Blanc, and on the N.W. the less lofty, but rugged chain of the Brévent and of the Aiguilles Rouges. Near the head of the valley is the village of Argentière (4101 ft.), which is connected with Switzerland by "char" (light carriage) roads over the Tête Noire and past Salvan, and by a mule path over the Col de Balme, which joins the Tête Noire route. These roads, and even those by a "char," road the Col de la Forclaz to Martigny in the Rhone valley. The principal village, Chamonix (3416 ft.), is 6 m. below Argentière by electric railway (which continues via Finhaut to Martigny) and is visited annually by a host of tourists, as it is the best starting-point for the exploration of the glaciers of the Mont Blanc chain, as well as for the ascent of Mont Blanc itself. It is connected with Geneva by a railway (55 m.). In 1906 the population of the village was 806, of the commune 3482.

The valley is first heard of about 1037, when it was granted by the count of the Genevois to the great Benedictine house of St Michael de la Cluse, near Turin, which by the early 13th century established a priory therein. But in 1768 the inhabitants bought their freedom from the canons of Sallanches, to whom the priory had been transferred in 1319. In 1530 the inhabitants obtained from the count of the Genevois the privilege of holding two fairs a year, while the valley was often visited by the civil officials and by the bishops of Geneva (first recorded visit in 1471, while Francis de Sales came thither in 1576). The valley of Chamonix was first mentioned in 1201 by Theobald II, "le Chansonnier" (the singer), who was the son of Theobald III, and Blanche of Navarre, and was born some days after the death of his father. From 1201 to 1222 he remained under the tutelage of his mother, who governed Champagne with great sagacity. The reign of this prince was singularly eventful. The two daughters of count Henry II. successively claimed the countship, so that Theobald had to combat the claims of Philippa, wife of Erard de Brienne, scourge of Ramorn, from 1216 to 1222, and those of Alix, queen dowager of Cyprus, in 1233 and 1234. In 1226 he followed king Louis VII. to the siege of Avignon, and after the death of that monarch played a prominent part during the reign of St Louis. At first leagued with the malcontent barons, he allowed himself to be gained over by the queen-mother, and forms the departments of Ardenne, Marne, Aube and Haute-Marne, with part of Aisne, Seine-et-Marne, Yonne, and Meuse. Its name—In Latin Compositis, "country of plains"—is derived from the immense plains near Reims, Châlons and Troyes. It was constituted towards the end of the middle ages by joining to the countship of Champagne the ecclesiastical dukedoms of Reims and Langres, together with the ecclesiastical county of Châlons. Documents of the 12th and 13th centuries make it possible to determine the territorial configuration of the countship of Champagne with greater accuracy than in the case of any other fief of the crown. Formed at random by the acquisitions of the countships of the houses of Vermandois and Blois, Champagne reckoned among its dependencies, from 1152 to 1234, the countship of Blois and Chartres, of which Touraine was a fief, the countship of Sancerre, and various scattered fiefs in the Bourbonnais and in Burgundy. Officially called the "countship of Champagne and Brie" since 1217, this state was formed by the union of the countships of Troyes and Meaux, to which the greater part of the districts embraced in the country known, since the beginning of the middle ages, by the name of Champagne and Brie came in course of time to be attached. Placed under the authority of the king of France, it was reckoned among the "great fiefs" of the French crown:

About 1020 Eudes or Odo I. (Odo II., count of Blois) became count of Champagne. He disputed the kingdom of Burgundy with the emperor Conrad, and died in 1037, in a battle near Bar-le-Duc. In 1037 he was succeeded by his younger son, Stephen II. About 1050 Odo II., son of Stephen II., became count. This prince, guilty of murder, found refuge in Normandy, where he received the castle of Aumale. He took part in 1066 in the conquest of England, and became earl of Holderness. About 1063 Theobald (Thibaud) I., count of Blois and Meaux, eldest son of Odo I., became count of Champagne. In 1077 he seized the countships of Vitry and Bar-sur-Aube, left vacant by Simon of Valois, who had retired to a monastery. In 1109 Odo III., second son of Theobald II., became count, and was succeeded about 1103 by his younger brother, Hugh, who became a templar in 1125, and gave up the countship to his suzerain, the count of Blois. In 1123 the English king Henry I. invaded Champagne, and the count was captured. After the death of King Stephen of England, the countship of Blois was divided into two parts: Great, already count of Blois and Meaux, and one of the most powerful French barons of his time. He was related to the royal house of England, and incurred the displeasure of the king of France, who in 1142 invaded Champagne and burnt the town of Vitry. After Theobald the Great the countship of Blois ceased to be the dominant fief of his house and became the appanage of a younger branch. In 1152 Henry the Liberal, eldest son of Theobald II., became count of Champagne; he married Mary, daughter of Louis VII. of France, and went to the crusade in 1178. He was taken prisoner by the Turks, recovered his liberty through the good offices of the emperor of the East, and died a few days after his return to Champagne. In 1181 his eldest son, Henry II., succeeded him under the tutelage of Mary of France. In 1190 he went to the Holy Land, and became king of Jerusalem in 1192 by his marriage with Isabelle, widow of the marquis of Montferrat. He died in 1197 in his town of Acre from the results of an accident. In 1197 Theobald III., younger son of Henry I., became prince of these fiefs transferred in 1201 by Theobald II., "le Chansonnier" (the singer), who was the son of Theobald III., and Blanche of Navarre, and was born some days after the death of his father. From 1201 to 1222 he remained under the tutelage of his mother, who governed Champagne with great sagacity. The reign of this prince was singularly eventful. The two daughters of count Henry II. successively claimed the countship, so that Theobald had to combat the claims of Philippa, wife of Erard de Brienne, scourge of Ramorn, from 1216 to 1222, and those of Alix, queen dowager of Cyprus, in 1233 and 1234. In 1226 he followed king Louis VII. to the siege of Avignon, and after the death of that monarch played a prominent part during the reign of St Louis. At first leagued with the malcontent barons, he allowed himself to be gained over by the queen-mother, and the French crown, and the latter was the result of a matrimonial alliance.
thus came into collision with his old allies. He became king of Navarre in 1334 by the death of his maternal uncle, Sancho VII., but by the curious treaty which he concluded in that year with the queen of Cyprus he was compelled to cede to the king, in return for a large sum of money, the lordship of the county of Blois, Chartres and Sancerre, and the viscountcy of Châteaudeuon. In 1329 and 1340 he took part in an expedition to the Holy Land, probably accompanied St Louis in 1342 in the campaign of Saintonge against the English, and died on the 14th of July 1254 at Pampeluna. If the author of the *Grande chroniques de France* can be believed, Theobald IV. conceived a passion for Queen Blanche, the mother of St Louis,—a passion which she returned, and which explains the changes in his policy; but this opinion apparently must be relegated to the category of historical fables. The witty and courtly songs he composed place him in the front rank of the poets of that class, in which he showed somewhat more originality than his rivals. In 1254 Theobald V., the Young, eldest son of Theobald IV. and, like his father, king of Navarre, became count of Champagne. He married Isabelle of France, daughter of St Louis, and followed his father-in-law to Taranto, where he contracted fever and died on his return. In 1270 he was succeeded by Henry III., the Fat, king of Navarre. Henry was succeeded in 1274 by his only daughter, Joan of Navarre, under the tutelage of her mother, Blanche of Artois, and afterwards of Edmund, earl of Lancaster, her mother's second husband. In 1284 she married the heir-presumptive to the throne of France, Philip the Fair, to whom she brought the countship of Champagne as well as the kingdom of Navarre. She became queen of France in 1285, and died on the 4th of April 1305, when her eldest son by King Philip, Louis Hutin, became count of Champagne. He was the last independent count of the province, which became attached to the French crown on his accession to the throne of France in 1314.

The celebrated fairs of Champagne, which flourished in the 12th and 13th centuries, were attended by merchants from all parts of civilized Europe. They were six in number: two at Troyes, two at Provins, one at Lagny-sur-Marne, and one at Bar-sur-Aube. They formed a kind of continuous market that lasted into six periods, and included the king from Lagny to Bar, from Bar to Provins, from Provins to Troyes, from Troyes to Provins and from Provins to Troyes, to complete the year. It was, in fact, a perpetual fair, which had at once unity and variety, offering to the different parts of the countship the means of selling successively the special productions of their soil or their industry, and of procuring in exchange riches and comforts. These fairs had special legislation; and special magistrates, called "masters of the fairs," had control of the police.

For the wine "champagne" see Wine.

CHAMPAGNY, JEAN BAPTISTE NOMPRE DE (1756-1834), French politician, was born at Roanne, and entered the navy in 1774. He fought through the war in America and resigned in 1783. He was elected deputy for the department of Forez to the Estates General, 1789, and went over to the third estate on the 21st of June and collaborated in the work of the Constituent Assembly, especially occupying himself with the reorganization of the navy. A political career seems to have attracted him little; he remained in private life from 1791 to 1799, when Napoleon named him member of the council of state. From July 1801 to August 1804 he was ambassador of France at Vienna, and directed with great intelligence the incessant negotiations between the two courts. In August 1804 Napoleon made him minister of the interior, and in this position, which he held for three years, he proved an administrator of the first order. In addition to the ordinary charges of his office, he had to direct the recruitment of the army, organize the industrial exhibition of 1808, and to complete the public works undertaken in Paris and throughout France. He was devoted to Napoleon, on whom he lavished adulation in his speeches. In August 1807 the emperor chose him to succeed Talleyrand as minister for foreign affairs. He directed the annexation of the Papal States in April 1808, worked to secure the coöperation of Charles IV. of Spain in May 1808, negotiated the peace of Vienna (1809) and the marriage of Napoleon. In April 1811 a quarrel with the emperor led to his retirement, and he obtained the sinecure office of intendant general of the crown. In 1814, after the abdication, the empress sent him on a fruitless mission to the emperor of Austria. Then he went over to the Bourbons. During the Hundred Days he again joined Napoleon. This led to his exclusion by Louis XVIII., but in 1819 he recovered his dignity of peer. He died in Paris in 1834. He had three sons who became men of distinction. François (1804-1882) was a well-known author, who was made a member of the French Academy in 1869. His great work was a history of the Roman empire, in three parts, (1) Les Césars (1814-1843, 4 vols.), (2) Les Antonins (1863, 3 vols.), (3) Les Césars du IIIe siècle (1870, 3 vols.). Napoleon (1806-1872) published a *Traité de la police municipale en 4 volumes* (1844-1846), and was a deputy in the Corps Législatif from 1852 to 1870. Jérôme Paul (1800-1880) was also deputy in the Corps Législatif from 1853 to 1870, and was made honorary chamberlain in 1879. He worked at the official publication of the correspondence of Napoleon.

CHAMPAIGN, a city of Champaign county, Illinois, U.S.A., about 125 m. s. by W. of Chicago, on the head-waters of the Vermillion river. Pop. (1890) 5830; (1900) 9098, of whom 973 were foreign-born; (1910 census) 12,481. It is served by the Cleveland, Cincinnati, Chicago & St Louis, the Wabash, and the Illinois Central railways (the last having repair shops here), and by the Illinois (electric) Traction System from Danville, Illinois, to St Louis, Missouri. In 1906 the city covered 3850 sq. m.; it is situated in a rich agricultural region, and has small manufacturing interests. Immediately east of Champaign is the city of Urbana, the county-seat of Champaign county, served by the Wabash and the Cleveland, Cincinnati, Chicago & St Louis railways, with repair shops of the latter. In 1890 the population of Urbana was 3511; in 1900, 5728 (300 foreign-born; in 1910, 8245. Partly in Urbana and partly in Champaign is the University of Illinois (see Urbana); immediately south of its campus is the 400-acre farm of the university. Each city has a public library, and in Champaign are the Burnham Athenaeum, the Burnham hospital, the Garwood home for old ladies, and several parks, all gifts of former citizens. Champaign was founded in 1855, incorporated as a city in 1860, and re-chartered in 1883. Urbana secured a city charter in 1855.

CHAMPAIGNE, PHILIPPE DE (1602-1674), Belgian painter of the French school, was born at Brussels of a poor family. He was a pupil of J. Fouquière; and, going to Paris in 1621, was employed by N. Du Chesne to paint along with Nicholas Poussin in the palace of the Luxembourg. His best works are to be found at Vincennes, and in the church of the Carmelites at Paris, where is his celebrated Crucifix, a signal perspective success, on one of the vaulings. After the death of Du Chesne, Philippe became first painter to the queen of France, and ultimately rector of the Academy of Paris. As his age advanced and his health failed, he retired to Poissy, where he died a daughter of N. Du Chesne. Along with Carjat and Anguier, he painted a celebrated picture, now in the Louvre, highly remarkable for its solid unaffected truth. This, indeed, is the general character of his work.—grave reality, without special elevation or depth of character, or charm of warm or stately colour. He produced an immense number of paintings, religious and other subjects as well as portraits, dispersed over various parts of France, and now over the galleries of Europe. Philippe was a good man, indefatigable, earnest and scrupulously religious. He died on the 12th of August 1674.

CHAMPARAN, or CHUMPARUN, a district of British India, in the Patna division of Bengal, occupying the north-west corner of Behar, between the two rivers Gandak and Bagmati and the Nepal hills. It has an area of 3331 sq. m. In 1901 the population was 1,790,463, showing a decrease of 4% in the decade. A broad grass-covered road or embankment defines the Nepal frontier, except where rivers or streams form a natural
boundary. The district is a vast level except in the N. and N.W., where it undulates, and gradually assumes a rugged appearance as it approaches the mountains and forests of Nepal. Wide uncultivated tracts cover its north-western corner; the southern and western parts are carefully cultivated, and teem with an active agricultural population. The principal rivers are the Gandak, navigable all the year round, the Buri Gandak, Panch Nadi, Lalbagia, Koja and Teur. Old beds of rivers intersect Champaran in every direction, and one of these forms a chain of lakes which occupy an area of 139 sq. m. in the centre of the district. Champaran, with the rest of Bengal and Behar, was acquired by the British in 1765. Up to 1866 it remained a subdivision of Saran. In that year it was separated and formed into a separate district. The administrative headquarters are at Mothiari (population, 13,730); Bettia is the centre of a very large estate; Segauli, still a small military station, was the scene of a massacre during the Mutiny. Champaran was the chief seat of indigo planting in Behar before the decline of that industry. There are about 40 saltpetre refineries. The district suffered severely from drought in 1866 and 1874, and again in 1869. In the small gymnasia or small law courts of the Gandak district the chief from the Gandak has also been constituted. The district is traversed almost throughout its length by Bettia by the Tirhoot state railway. A considerable trade is conducted with Nepal.

CHAMPEAUX—CHAMPIONNET

C. 1070–1111), French philosopher and theologian was born at Champaeaux near Melun. After studying under Anselm of Laon and Roscellinus, he taught in the school of the cathedral of Notre Dame, of which he was made canon in 1093. Among his pupils was Abelard. In 1108 he retired into the abbey of St Victor, where he resumed his lectures. He afterwards became bishop of Châlons-sur-Marne, and took part in the dispute concerning investitures as a supporter of Calixtus II., whom he represented at the conference of Mousson. He was also bishop of Mâcon in 1122. His earliest work is a fragment on the Eucharist (inserted by Jean Mabillon in his edition of the works of St Bernard), and the Moralita Abbreciata and De Origine Animae (in E. Martínez's Thesaurus novum Anecdorum, 1717, vol. 5). It is the best to be maintained that children who die unbaptized must be lost, the pure soul being defiled by the grossness of the body, and declares that God's will is not to be questioned. He upholds the theory of Creationism (that a soul is specially created for each human being). Ravaïsson-Mollien has discovered a number of fragments by him, among which the most important is the De Essentia Dei et de Substantia Dei; a Liber Sententiarum, consisting of discussions on ethics and Scriptural interpretation, is also ascribed to Champeaux. He is reputed the founder of Realism. For his views and his controversy with Abelard, see SCHOLASTICISM AND ABElard.

CHAMPION (Fr. champion, Late Lat. campio from campus, a field or open space, i.e. one "who takes the field" or fights; cf. Ger. Kampf, battle, and Kämpfer, fighter), in the judicial combats of the middle ages the substitute for a party to the suit disabled from bearing arms or specially exempted from the duty to do so (see Wagger). Hence the word has come to be applied to any one who "champions," or contends on behalf of, any person or cause. In the laws of the Lombards (lib. ii. tit. 66 §§ 38, 39), those who by reason of youth, age or infirmity could not bear arms were allowed to nominate champions, and the same provision was made in the case of women (lib. i. tit. 3 § 6, tit. 10, § 2). This was practically the rule laid down in all subsequent legislation on the subject. Thus the Assize of Jerusalem (cap. 39) says: "These are the people who may defend themselves through champions; a woman, a sick man, a man who has passed the age of sixty, &c." The clergy, too, whether as individuals or corporations, were represented by champions; in the case of bishops and abbots this function was part of the duties of the advocatus (see ADVOCATE). Du Cange gives instances of mercenary champions (campiones conductillit), who were regarded as infamous persons and sometimes, in case of default, were compelled to pay the hand or foot. Some of these champions were called "serjeants," i.e. rendered service to lords, churches or cities in consideration of the grant of certain fiefs, or for annual money payments, the champion doing homage to the person or corporation represented by him (campiones homagi).

The office of "king's champion" (campio regis) is peculiar to England. The function of the king's champion, when the ceremonial of the coronation was carried out in its completeness, was to ride, clad in complete armour, on his right the high constable, on his left the earl marshal, into Westminster Hall during the coronation banquet, and challenge to single combat any who should dispute the king's right to reign. The challenge was thrice repeated by the herald, at the entrance to the hall, in the centre, and at the foot of the dais. On picking up his gauntlet for the third time the champion was pledged by the king in a gilt-covered cup, which was then presented to him as his fee by the king. If he had had occasion to fight, and was victorious, his fee would have been the armour he wore and the horse he rode, the second best in the royal stables; but no such occasion has ever arisen. This picturesque ceremonial was last performed at the coronation of George IV. The office of king's champion is of great antiquity, and its origins are involved in great obscurity. It is said to have been held under William the Conqueror by Robert or Roger Marmion, whose ancestors had been hereditary champions in Normandy. The first authentic record, however, is a charter of Henry I., signed by Robert Marmion (Robertus de Bajucis campio regis). Of the actual exercise of the office the earliest record dates from the coronation of Richard II. On this occasion the champion, Sir John Dymoke, appeared at the door of the Abbey immediately after the coronation mass, but was peremptorily told to go away and return later; moreover, in his bill presented to the court of claims, he stated that the champion was to ride in the procession before the service, and make his challenge to all the world. This seems to show that the ceremony, as might be expected, was originally performed before the king's coronation, when it would have had some significance. The office of king's champion is hereditary, and is now held by the family of Dymoke (q.v.).

CHAMPIONNET, JEAN ÉTIENNE (1762–1800), French general, enlisted in the army at an early age and served in the great siege of Gibraltar. When the Revolution broke out he took a prominent part in the movement, and was elected by the men of a battalion to command them. In May 1793 he was charged with the suppression of the disturbances in the Jura, which he quelled without bloodshed. Under Pichegru he took part in the Rhine campaign of that year as a brigade commander, and at Weissenburg and in the Palatinate won the warm commendation of Lazare Hoche. At Fleurs his stubborn fighting
in the centre of the field contributed greatly to Jourdan's victory.

In the subsequent campaigns he commanded the left wing of
the French armies on the Rhine between Neuvied and Dinseldorf,
and took a great part in all the successful and unsuccessful
expeditions to the Lahn and the Main. In 1798 Championnet
was named commander-in-chief of the "army of Rome" which
was protecting the infant Roman republic against the Neapolitan
court and the British fleet. Nominally 32,000 strong, the army
scarce numbered 8000 effective, with a bare fifteen cartridges
per man. The Austrian general Mack had a tenfold superiority
in numbers, but Championnet so well held his own that he ended
by capturing Naples itself and there setting up the Parthenonian
Republic. But his intense earnestness and intolerance of
opposition soon embroiled him with the civilians, and the
general was recalled in disgrace. The following year, however,
saw him again in the field as commander-in-chief of the "army
of the Alps." This, too, was at first a mere paper force, but after
three months' hard work it was able to take the field. The
campaign which followed was uniformly unsuccessful, and,
won out by the unequal struggle, Championnet died at Antibes
on the 9th of January 1800. In 1884 a statue was erected in his
honour at Valence.

Valence is named after St Albin, Championnet, ou les Campagnes de

CHAMPLAIN, SAMUEL DE (1567—1635), French explorer,
colonial pioneer and first governor of French Canada, was born
at Brouage, a small French port on the Bay of Biscay, in 1567.
His father was a sea captain, and the boy was early skilled in
seamanship and navigation. He entered the army of Henry IV.,
and served in Brittany under Jean d'Aumont, Francois de St
Luc and Charles de Brissac. When the army of the League was
disbanded he accompanied his uncle, who had charge of the
ships in which the Spanish allies were conveyed home, and on
reaching Cadiz secured (1599) the command of one of the vessels
about to make an expedition to the West Indies. He was gone
over two years, visiting all the principal ports and pushing
inland from Vera Cruz to the city of Mexico. The MS. account
of his adventures, Bref Discours des Choses plus remarquables
que Samuel Champlain de Brouage a reconnues aux Indes Occi-
dentales, is in the library at Dieppe. It was not published in
French until 1815, although an English translation was printed
by the Hakluyt Society in 1859. It contains a suggestion of
France's claims to a naval station on the Nova Scotia coast by
the English, and a statement that the English and the French
would be shorted by more than 1500 leagues. In 1603 Champlain
made his first voyage to Canada, being sent out by Aymar de
Clermont, seigneur de Chastes, on whom the king had bestowed
a patent. Champlain at once established friendly relations
with the Indians and explored the St Lawrence to the rapids
above Montreal. On his return he published an interesting
and historically valuable little book, Des sauvages, ou voyage de
Samuel Champlain de Brouage fait en la France Nouvelle.
During his absence de Chastes had died, and his privileges and fur trade
monopolies were conferred upon Pierre de Guast, sieur de Monts
(1560—1611). With him, in 1604, Champlain was engaged in
exploring the coast as far south as Cape Cod, in seeking a site
for a new settlement, and in making surveys and charts. They
first settled on an island near the mouth of the St Croix river,
and then at Port Royal—now Annapolis, N.S.

Meanwhile the Basques and Bretons, asserting that they were
being ruined by de Monts' privileges, got his patent revoked,
and Champlain joined with the encouragers of protestantism
when, however, in modified form, the patent was re-granted to
his patron Champlain induced him to abandon Acadia and
establish a settlement on the St Lawrence, of the commercial
advantages of which, perhaps even as a western route to China
and Japan, he soon convinced him. Champlain was placed in
command of one of the two vessels sent out. He was to
explore and colonize, while the other vessel traded, to pay for the
expedition. Champlain fixed on the site of Quebec and founded
the first white settlement there in July 1608, giving it its present
name. In the spring he joined a war party of Algonquins and
Hurons, discovered the great lake that bears his name, and, near
the present Ticonderoga, took with his arquebus an important
part in the victory which his savage friends obtained over the
Iroquois. The Iroquois naturally turned first to the Dutch and
then to the English for allies. "Thus did new France rush into
collision with the redoubted warriors of the Five Nations. Here
was the beginning, and in some measure doubtful the cause,
of a long suite of murderous conflicts, bearing havoc and flame
to generations yet unborn" (Parkman). Champlain returned to
France and again related to Henry IV.—who had previously
learned his worth and had pensioned him—his exciting adventures.
De Monts failed to secure a renewal of his patent, but resolved
to proceed without it. Champlain was again (1611) in Canada,
fighting for and against the Indians and establishing a trading
post at Mont Royal (see Montreal). He was the third white
man to descend, and the second to descend successfully, the
Lachine Rapids. De Monts, now governor of Paris, was too busy
to occupy himself in the waning fortunes of the colony, and left
them entirely to his associate. An influential protector was
needed; and Champlain prevailed upon Charles de Bourbon,
comte de Soissons, to interest himself to obtain from the king
the appointment of lieutenant-general in New France. The
comte de Soissons died almost immediately, and was succeeded
in the command of the expedition by Championnet, prince de Condé,
and he, like his predecessors and successors in the office of
governor of New France, devoted himself to the growth and
strengthening of Quebec. Every year he went to France with
this end in view. He was one of the hundred associates of the
Company of New France, created by Richelieu to reform abuses
and take over all his country's interests in the new world.
These ill-defended possessions England now prepared to seize.
Three ships were sent out under letters of marque commanded
by David, Lewis and Thomas Kirke, and Quebec, already on the
verge of starvation, was compelled to surrender (1629). Cham-
pain was taken to England a prisoner, but when Canada was
restored to the French he returned (1633) to his post, where he
died on the 25th of December 1635. He had married in 1610,
Hélène Bouillé, then but twelve years old. She did not leave
France for Canada, however, until ten years later. After his
death she became a nun.

Champlain's complete works in 6 vols. were published under the
patronage of the University of Laval in 1870. There is a careful
translation of Champlain's Voyages, by Professor and Mrs E. G.
Bourne in the "Trailmaker" series edited by Prof. J. B. McMaster,
See F. Parkman, Pioneers of France in the New World (1865); J.
Webster, Cartier to Frontenac (1894); N. E. Dionne, Champlain
(N. E. D.)

CHAMPLAIN, a lake lying between the states of New York
and Vermont, U.S.A., and penetrating for a few miles into
Canada. It extends about 130 m. from N. to S., varies from
4 to 1 m. in width for 40 m. from its S. terminus, and then
widens until it reaches a maximum width of about 11 m. near
Ausable Point. Its area is about 500 sq. m. Its surface is 66
ft. above the sea. In the north part it is generally from 200 to
300 ft. deep; opposite Essex, N.Y., near its middle, the depth
increases to 400 ft.; but farther south it is much less; throughout the greater part of the lake there is a depth of water of more than 100 ft. Since the lake is caused by the ponding of water in a broad irregular valley, the shore line is nearly everywhere much broken, and in the northern portion are several islands, both large and small, most of which belong to Vermont. These islands divide the lake's northern end into two large arms which later in the Canada. From the western arm the Richelieu river flows out, carrying the water of Champlain to the St. Lawrence. The waters abound in salmon, salmon-trout, sturgeon and other fish, and are navigated from end to end by large steamboats and vessels of considerable tonnage. The lake was formerly the seat of extensive traffic, especially in lumber, but navigation has greatly decreased; the tonnage entering and clearing at the lake was twice as great in the early '70's as it was thirty years later. The principal ports are Burlington, Vt., and Plattsburg, N.Y. Lake Champlain lies in a valley from 1 to 30 m. wide, between the Green Mountains on the east and the Adirondack Mountains on the west, and the scenery is most picturesque. On the east side is a rather gradual ascent for 20 m. or more from shore to summit, while on the west side the ascent is by a succession of hills, in some places from the water's edge. North of Crown Point low mountains rise 1000 to 1600 ft. above the lake, and behind these are the higher peaks of the Adirondacks, reaching an elevation of more than 5000 ft. Lake George is a tributary to the south; several small streams flow from each side to Champlain's Channel. Lake Champlain forms a natural outlet to the north into the St. Lawrence.

Lake Champlain was named from Samuel de Champlain, who discovered it in July 1609. The valley is a natural pathway between the United States and Canada, and during the various wars which the English have waged in America it had great strategic importance. In 1713 the French built a fort at Crown Point; in 1756, another at Ticonderoga; and both were important strategic points in the French and Indian War as well as in the American War of Independence. On the 11th of October 1776, the first battle between an American and a British fleet, the battle of Valcour Island, was fought on the lake. Benedict Arnold, the American commander, with a decidedly inferior force, withstood the British under Thomas Pinel for about seven hours, and then during the night escaped through the enemy's line. Although overtaken the next day he again, after a fight of a few hours, made a successful retreat.

At the beginning of the War of 1812 the American naval force on the lake, though very small, was superior to that of the British, but on the 3rd of June 1813 the British captured two American sloops in the narrow channel at the northern end and gained supremacy. Both sides now began to build and equip vessels for a decisive contest; by May 1814 the Americans had regained supremacy, and four months later a British land force of 11,000 men under Sir George Prevost (1767-1816) and a naval force of 16 vessels of about 2402 tons with 937 men and 42 guns under Captain George Downie (d. 1814) confronted an American land force of 1500 men under Brigadier-General Alexander Macomb (1752-1814), strongly entrenched at Plattsburg, and an American naval force (anchored in Plattsburg Bay) of 14 vessels of about 2244 tons with 582 men and 56 guns under Commodore Thomas Macdonough (1758-1823). In the open lake the British naval force should have been the superior, but at anchor in the bay the Americans had a decided advantage. Expecting the British land force to drive the American fleet from its anchorage, Captain Downie, on the 11th of September 1814, began the battle of Lake Champlain. It had continued only fifteen minutes when he was killed; the land force failed to co-operate, and after a severe fight at close range for 23 hours, during which the British lost about 300 men, the Americans 200 and the vessels of both sides were greatly shattered, the British retreated both by land and by water, abandoning their plan of invading New York.

CHAMPELÉ, MARIE (1642-1698), French actress, was born in Rouen of a good family. Her father's name was Desmares. She made her first appearance on the stage at Rouen with Charles Chevillet (1645-1701), who called himself sieur de Champlé, and they were married in 1666. By 1669 they were playing in Paris at the Théâtre du Marais, her first appearance there being as Venus in Boyer's Fête de Venus. The next year, as Hermione in Racine's Andromaque, she had a great success at the Hôtel de Bourgogne. Her intimacy with Racine dates from then. Some of his finest tragedies were written for her, but her repertoire was not confined to them, and many an indifferent play—like Thomas Corneille's Ariane and Comte d'Esses—owed its success to "her natural manner of acting, and her pathetic rendering of the hapless heroine." Pkèdre was the climax of her triumphs, and when she and her husband deserted the Hôtel de Bourgogne (see Békär sk at fin.), it was selected to open the Comédie Française on the 26th of August 1680. Here, with Mme de Guérin as the leading comedy actress, she played the great tragic love parts for more than thirty years, dying on the 15th of May 1698. La Fontaine dedicated her to his novel Bélîgôr, and Boileau immortalized her in verse. Her husband distinguished himself both as actor and playwright, and his Parisien (1682) gave Mme de Guérin one of her greatest successes.

Her brother, the actor Nicolas Desmares (c. 1650-1714), began as a member of a subsidized company at Copenhagen, but by her influence he came to Paris and was received in 1685 sans début—the first time such an honour had been accorded—at the Comédie Française, where he became famous for peasant parts. His daughter, to whom Christian V. and his queen stood sponsors, Christine Antoinette Charlotte Desmares (1682-1733), was a fine actress in both tragedy and soubrette parts. She made her début at the Comédie Française in 1699, in La Grange Chastel's Grec et Plydie, and was at once received as Mlle de Guérin. She married in 1702.

CHAMPION, JEAN FRANÇOIS (1792-1822), French Egyptologist, called le Jeune to distinguish him from Champollion-Figeac (q.v.), his elder brother, was born at Figeac, in the department of Lot, on the 23rd of December 1790. He was educated by his brother, and was then appointed government pupil at the Lyceum, which had recently been founded. His first work (1801) was an attempt to show by means of their names that the giants of the Bible and of Greek mythology were personifications of natural phenomena. At the age of sixteen (1807) he read before the academy of Grenoble a paper in which he maintained that the Coptic was the ancient language of Egypt. He soon after removed to Paris, where he enjoyed the friendship of Langlel, De Sacy and Millin. In 1809 he was made professor of history in the Lyceum of Grenoble, and there published his earlier works. Champollion's first decipherment of hieroglyphics dates from 1811. In 1813 he was sent by Charles X. to Egypt as director-collector of antiquities. He surveyed the tombs of Tutankhamun, Merneptah, and Ramses II., and was later placed chief of the Antiquities of Turin, Leghorn, Rome and Naples; and on his return he was appointed director of the Egyptian museum at the Louvre. In 1827 he was commissioned to undertake the conduct of a scientific expedition to Egypt in company with Rosellini, who had received a similar appointment from Leopold II., grand duke of Tuscany. He remained there about a year. In March 1831 he received the chair of Egyptian antiquities, which had been created specially for him, in the Collège de France. He was engaged with Rosellini in publishing the results of Egyptian researches at the expense of the Tuscan and French governments, when he was seized with a paralytic disorder, and died at Paris in 1832. Champollon, whose claims were hotly disputed for many years after his death, is now universally acknowledged to have been the founder of Egyptology.

He wrote L'Egypte sous les Pharaons (2 vols., 180, 1814); Sur l'Architecture hitélifeque, &c. (1824); Pantheon égyptien, ou collection des personnages mythologiques de l'ancienne Egypte (incomplete);
Monuments de l'Égypte et de la Nubie considérés par rapport à l'histoire, la religion, etc.; Grammaire égyptienne (1836), and Dictionnaire égyptien (1841), edited by his brother; Analyse méthodique du texte démotique de Rosette; Aperçu des résultats historiques de la découverte de l'alphabet hieroglyphique (1827); Mémoires sur les signes employés par les Égyptiens dans leurs trois systèmes graphiques, la notation des principales divisions du temps; Lettres écrites d'Égypte et de Nubie (1833); and also several letters on Egyptian subjects, addressed at different periods to the duc de Blacas and others.

See: Hartleben, Champollion and Figeac, Werk (2 vols., 1906); also ÉGYPT: Language and Writing (ad init.).

CHAMPOLLION-FIGEAC—JACQUES JOSEPH (1778–1867). French archaeologist, elder brother of Jean François Champollion, was born at Figeac in the department of Lot, on the 5th of October 1778. He became professor of Greek and literature at Grenoble, but was compelled to retire in 1816 on account of the part he had taken during the Hundred Days. He afterwards became keeper of manuscripts at the Bibliothèque Nationale in Paris, and professor of palæography at the École des Chartes. In 1849 he became librarian of the palace of Fontainebleau. He edited several of his brother's works, and was also author of original works on philologial and historical subjects, among which may be mentioned Nouvelles recherches sur les patries ou idiomes vulgaires de la France (1809), Annales de Logiges (1819) and Charles latines sur papirus du IVe siècle de l'ère chrétienne. His son Aimé (1812–1894) became his father's assistant at the Bibliothèque Nationale and a leading historian, and was the author of a biographical and bibliographical study of his family in Les Deux Champollion (Grenoble, 1887).

CHOICE (through O. Fr. chêance, from the Late Lat. cadentia, things happening, from cadere, to fall out, happen; cf. "case"), an accident or event, a phenomenon which has no apparent or discoverable cause; hence an event which has not been expected, a piece of good or bad fortune. From the popular idea that anything of which no assignable cause is known there is no cause, chance (Gr. ῥήγη) was regarded as having a substantial objective existence, being itself the source of such uncaused phenomena. For the philosophic theories relating to this subject see ACCIDENTALISM.

"Chance," in the theory of probability, is used in two ways. In the stricter, or mathematical usage, it is synonymous with probability; i.e. if a particular event may occur in n ways in an aggregate of p events, then the "chance" of the particular event occurring is given by the fraction n/p. In the second usage, the "chance" is regarded as the ratio of the number of ways in which a particular event may occur to the number of ways in which it may not occur; mathematically expressed, this chance is n/(p-n) (see Probability).

CHANCEL (through O. Fr. from Lat. plur. cancelli, dim. of cancellum, grating, lattice, probably connected with an Indo-European root kar-, to bend; cf. circus, curve, &c.), in the earliest and strictest sense that part of a church near the altar occupied by the deacons and sub-deacons assisting the officiating priest, this space having originally been separated from the rest of the church by cancelli or lattice work. The word cancelli is used in classical Latin of a screen, bar or the like, set to mark off an enclosed space in a building or in an open place. It is thus used of the bar in a court of justice (Cicero, Verres, ii. 3 seq.). It is particularly used of the lattice or screen in the ancient basilica, which separated the bema, or raised tribunal, from the rest of the building. The use of the name in ecclesiastical buildings is thus natural, for the altar stood in the place occupied by the bema in the apse of the basilica. From the screen the term was early transferred to the space inter cancellos, i.e. the locus altaris cancellis septus. This railed-off space is now generally known among Roman Catholics as the "sanctuary," the word chancel being little used. In the Church of England, however, the word chancel survived the Reformation, and is applied, both in the ecclesiastical and the architectural sense, to that part of the church occupied by the principal altar or communion table and by the clergy and singers officiating at the chief services; it thus includes presbytery, chancel proper and choir (q.v.), and in this sense, in the case of cathedrals and other large churches, is often used synonymously with choir. In this more inclusive sense the early English churches had no chancels, which were transferred comparatively late development; the cancelli, e.g. of such a church as San Clemente at Rome are equivalent not to the "chancel screen" of a medieval church but to the "altar rails" which divide off the sanctuary. In churches of the type that grew up to its perfection in the middle ages the chancels are clearly differentiated from the nave by structural features: by the raising of the floor level, by the presence of a "chancel arch," and by a chancel or rood screen (see ROOD). The chancel screen might be no more than a low barrier, some 4 ft. high, or a light structure of wood or wrought iron; sometimes, however, they were massive stone screens, which in certain cases were continued on either side between the piers of the choir and (on the European continent) round the east end of the sanctuary, as in the cathedrals of Paris, Bourges, Limoges, Amiens and Chartres. These screens served the purpose, in collegiate and conventual churches, of cutting off the space reserved for the services conducted for and by the members of the chapter or community. For popular services a second high altar was usually set up to the west of the screen, as formerly at Westminster Abbey. In parish churches the screen was set, partly to differentiate the space occupied by the clergy from that of the congregation, partly to support the reestorations of the crucifix known as the Rood. In these churches, too, the chancel is very usually structurally differentiated by being narrower and, sometimes, less high than the nave.

In the Church of England, the duty of repairing the chancel falls upon the parson by custom, while the repair of the body of the church falls on the parishioners. In particular cases, as in certain London churches, the parishioners also have to repair the chancel. Where there a.e. both a rector and a vicar the repairs are shared between them, and this is also the case where the rector is a lay impro prior. By the rubric of the English Prayer Book "the chancels shall remain as they have done in times past," i.e. distinguished from the body of the church by some partition sufficient to separate the two without interfering with the view of the congregation. At the Reformation, and for some time after, this distinction was regarded by the dominant Puritan party as a mark of sacerdotalism, and services were commonly said in other parts of the church, the chancels being closed and disused. The rubric, however, directs that "Morning and Evening Prayer" shall be used in the accustomed place in the church, chapel or chancel, except it shall be otherwise determined by the Ordinary. Chancel screens, with or without gates, are lawful, but chancellors of dioceses have refused to grant a faculty to erect gates, as necessary or inexpedient.

CHANCELLOR (M. Eng. and Anglo-Fr. canceler, chanceler, Fr. chancelier, Lat. cancellarius), an official title used by most of the peoples whose civilization has arisen directly or indirectly out of the Roman empire. At different times and in different countries it has stood and stands for very various duties, and has been, and is, borne by officers of various degrees of dignity. The original chancellors were the cancellarii of Roman courts of justice, ushers who sat at the cancelli or lattice work screens of a "basilia" or law court, which separated the judge and counsel from the audience (see CHANCEL). In the later Eastern empire the cancellarii were promoted at first to notarial duties. The barbarian kingdoms which arose on the ruin of the empire in the West copied more or less intelligently the Roman model in all their judicial and financial administration. Under the Frankish kings of the Merovingian dynasty the cancellarii were subordinate of the great officer of state called the referendarius, who was the predecessor of the more modern chancellor. The office became established under the form arch-chanceller, or chief of the cancellarii. Stubbs says that the Carolingian chancellor was the royal notary and the arch-chancellor keeper of the royal seal. His functions would naturally be discharged by a cleric in times when book learning was mainly confined to the clergy. From the reign of Louis the Pious the post was held
by a bishop. By an equally natural process he became the chief secretary of the king and of the queen, who also had her chancellor. Such an office possessed an obvious capacity for developing on the judicial as well as the administrative side. Appeals and petitions of aggrieved persons would pass through the chancellor's hands, as well as the political correspondence of the king. Nor was the king the only man who had need of a chancellor. Great officers and corporations also had occasion to employ an agent to do secretarial, notarial and judicial work for them, and called him by the convenient name of chancellor. The history of the office in its many adaptions to public and private service is the history of its development on judicial, administrative, political, secretarial and notarial lines.

The model of the Carolingian court was followed by the medieval states of Western Europe. In England the office of chancellor dates back to the reign of Edward the Confessor, the first English king to use the Norman practice of sealing instead of signing documents; and from the Norman Conquest onwards the succession of chancellors is continuous. The chancellor was originally, and long continued to be, an ecclesiastic, who combined the functions of the most dignified of the royal chaplains, the king's secretary in secular matters, and keeper of the royal seal. From the first, then, though at the outset overshadowed by that of the justiciar, the office of chancellor was one of great influence and importance. As chaplain the chancellor was keeper of the king's conscience; as secretary he enjoyed the royal confidence in secular affairs; as keeper of the seal he was necessary to all formal expressions of the royal will. By him and his staff of chaplains the whole secretarial work of the royal household was conducted, the accounts were kept under the justiciar and treasurer, writs were drawn up and sealed, and the royal correspondence was carried on. He was, in fact, as Stubbs puts it, a sort of secretary of state for all departments. "This is he," wrote John of Salisbury (d. 1180), "who cancels (cancellat) the evil laws of the realm, and makes equitable (equo) the commands of a pious prince," a curse and an acclaim of the chancellor's later equitable jurisdiction. Under Henry II., indeed, the chancellor was already largely employed in judicial work, either in attendance on the king or in provincial visitations; though the peculiar jurisdiction of the chancery was of later growth. By this time, however, the chancellor was "great alike in Curia and Exchequer"; he was secundus a rege, i.e. took precedence immediately after the justiciar, and nothing was done either in the Curia or the Exchequer without his consent. So great was his office that William FitzStephen, the biographer of Becket, tells us that it was not purchasable (emenda non est), a statement which requires modification, since it was in fact more than once sold under Henry I., Stephen, Richard and John (Stubbs, Const. Hist. i. pp. 384-497; Gneist, Const. Hist. of England, p. 219), an evil precedent which was, however, not long followed.

The judicial duties of the chancellor grew out of the fact that all petitions addressed to the king passed through his hands. The justiciar and the chancellor of such men became so great that in 1280 under Edward I., an ordinance was issued directing the chancellor and the justices to deal with the greater number of them; those which involved the use of the great seal being specially referred to the chancellor. The chancellor and justices were to determine which of them were "so great, so of grace, that the chancellor and others would not despatch them without the king," and these the chancellor and other chief ministers were to carry in person to the king (Stubbs ii. 261, note, and p. 268). At this period the chancellor, though employed in equity, had ministerial functions only; but when, in the reign of Edward III., the chancellor ceased to follow the court, his tribunal acquired a more definite character, and petitions for grace and favour began to be addressed primarily to him, instead of being merely examined and passed on by him to the king; and in the twenty-second year of this reign matters which were of grace were definitely committed to the chancellor for decision. This is the starting-point of the equitable jurisdiction of the chancellor, whence developed that immense body of rules, supplementing the deficiencies of modifying the harshness of the common law, which is known as Equity (q.v.).

The position of the chancellor as speaker or prolocutor of the House of Lords dates from the time when the ministers of the royal Curia formed ex officio a part of the commune concilium and parliament. The chancellor originally attended with the other officials, and he continued to attend ex officio after they had ceased to do so. If he chanced to be a bishop, he was summoned regularly qua bishop; otherwise he attended without summons. When not a peer the chancellor had no place in parliament except as chancellor, and the act of 31 Henry VIII. cap. 10 (1559) laid down that, if not a peer, he had "no interest to give any assent or dissent in the House." Yet Sir Robert Bouchier (d. 1349), the first lay chancellor, had protested in 1341 against the first statute of 15 Edward III. (on trial by peers, &c.), on the ground that it had not received his assent and was contrary to the laws of the realm. From the time, however, of William, Lord Cowper (first lord high chancellor of Great Britain in 1705, created Baron Cowper in 1760), all chancellors have been made peers on their elevation to the peerage. Sometimes the custody of the great seal has been transferred from the chancellor to a special official, the lord keeper of the great seal (see LORD KEEPER); this was notably the case under Queen Elizabeth (cf. the French garde des sceaux, below). Sometimes it is put into commission, being affixed by lords commissioners of the great seal. By the Catholic Emancipation Act of 1829 it was enacted that none of these offices could be held by a Roman Catholic (see further under LORD HIGH CHANCELLOR). The office of Lord chancellor of Ireland, and that of chancellor of Scotland (who ceased to be appointed after the Act of Union of 1709) followed the same lines of development.

The title of chancellor, without the predicates "high" or "lord," is also applied in the United Kingdom to a number of other officials and functionaries of varying rank and importance. Of these the most important is the chancellor of the exchequer, an office which originated in the separation of the chancery from the exchequer in the reign of Henry III. (1216-1272). His duties consisted originally in the custody and employment of the seal of the exchequer, in the keeping of a counter-roll to check the roll kept by the treasurer, and in the discharge of certain judicial functions in the exchequer of account. So long as the treasury board was in active working, the chancellorship of the exchequer was an office of small importance, and even during a great part of the 19th century was not necessarily a cabinet office, unless held in conjunction with that of first lord of the treasury. At the present time the chancellor of the exchequer is minister of finance, and therefore always of cabinet rank (see EXCHEQUER).

The chancellor of the duchy of Lancaster is the representative of the crown in the management of its lands and the control of its courts in the duchy of Lancaster, the property of which is scattered over several counties. These lands and privileges, though their inheritance has been vested in the king and his heirs, have always been kept distinct from the hereditary revenues of the sovereign, whose palatine rights as duke of Lancaster were distinct from his rights as king. The Judicature Act of 1873 left only the chancery court of the duchy, but the chancellor can appoint and dismiss the county court judges within the limits of the duchy; he is responsible also for the land revenues of the duchy, which are the private property of the sovereign, and keeps the seal of the duchy. His appointment is by letters patent, and his salary is derived from the revenue of the duchy. As the judicial and estate work is done by subordinate officials, the office is practically a sinecure and is usually given to a minister whose assistance is necessary to a government, but who for one reason or another cannot undertake the duties of an important department. John Bright described him as the "maid-of-all-work" of the cabinet.

The chancellor of a diocese is the official who presides over the bishop's court and exercises jurisdiction in his name. This use of the word is comparatively modern, and, though
employed in acts of parliament, is not mentioned in the commission, having apparently been adopted on the analogy of the ecclesiastical chancellors. The chancellor was originally the keeper of the archbishop or bishop's seals; but the office, as now understood, includes two other offices distinguished in the commission by the titles of vicar-general and official principal (see ECCLESIASTICAL JURISDICTION). The chancellor of a diocese must be distinguished from the chancellor of a cathedral, whose office is the same as that of the ancient scholasticus (see CATHEDRAL). The chancellor of an order of knighthood discharges notarial duties and keeps the seal. The chancellor of a university is an official of medieval origin. The appointment was originally made by the popes, and the office from the first was one of great dignity and originally of great power. The chancellor was, as he remains, the head of the university; he had the general superintendence of its studies and its discipline, could make and unmake laws, try and punish offences, appoint to professorial chairs and admit students to the various degrees (see Du Cange, s. “Cancellarii Academiarum”). In England the chancellorship of the universities is now a more or less ornamental office and is conferred on noblemen or statesmen of distinction, whose principal function is to look after the general interests of the university, especially in its relations with the government. The chancellor is represented in the university by a vice-chancellor, who performs the administrative and judicial functions of the office. In the United States the heads of certain educational establishments have the title of chancellor. In Scotland the foreman of a jury is called its chancellor. In the United States the chancellors are judges of the chancery courts of the states, e.g. Delaware and New Jersey, where these courts are still maintained as distinct from the courts of common law. In other states, e.g. New York since 1847, the title has been abolished, and there is no federal chancellor.

In diplomacy generally the chancellor of an embassy or legation is an official attached to the suite of an ambassador or minister. He performs the functions of a secretary, archivist, notary and the like, and is at the head of the chancery, or chancellery (Fr. chancellerie), of the mission. The functions of this office are the transcribing and registering of official despatches and other documents, and generally the transaction of all the minor business, e.g. marriages, passports and the like, connected with the duties of a diplomatic agent towards his nationals in a foreign country. The dignified connotation of the title chancellor has given to this office a prestige which in itself it does not deserve; and “chancery” or “chancellor” is commonly used as though it were synonymous with embassy, while diplomatic style is sometimes called style de chancellerie, though as a matter of fact the chanceries have nothing to do with it.

France.—The country in which the office of chancellor followed most closely the same lines as in England is France. He became a great officer under the Carolingians, and he grew still greater under the Capetian sovereigns. The great chancellor, summus cancellarius or archi-cancellarius, was a dignitary who had indeed little real power. The post was commonly filled by the archbishop of Reims, or the bishop of Paris. The cancellarii, who formed part of the royal court and administration, was officially known as the sub-cancellarii in relation to the summus cancellarius, but as protocancellarii in regard to his subordinate cancellarii. He was a very great officer, an ecclesiastical who was the chief of the king's chaplains or king's clerks, who administered all ecclesiastical affairs; he had judicial powers, and from the 12th century had the general control of foreign affairs. The chancellor in fact became so great that the Capetian kings, who did not forget the mayor of the palace, grew afraid of him. Few of the early ecclesiastical chancellors failed to come into collision with the king, or parted with him on good terms. Philip Augustus suspended the chancellorship throughout the whole of his reign, and appointed a keeper of the seals (garde des sceaux). The office was revived under Louis VIII., but the ecclesiastical chancellorship was finally suppressed in 1227. The king of the 13th century employed only keepers of the seal. Under the reign of Philip IV. le Bel lay chancellors were first appointed. From the reign of Charles V. to that of Louis XI. the French chancelier was elected by the royal council. In the 16th century he became irremovable, a distinction more honourable than effective, for though the king could not dismiss him from office he could, and on some occasions did, deprive him of the right to exercise his functions, and entrusted them to a keeper of the seal. The chancelier from the 13th century downwards was the head of the law, and performed the duties which are now entrusted to the minister of justice. His office was abolished when in 1790 the whole judicial system of France was swept away by the Revolution. The smaller chancellers of the provincial parlements and royal courts disappeared at the same time. But when Napoleon was organizing the empire he created an arch-chancellor, an office which was imitated rather from the Erz-Kanzler of the Holy Roman Empire than from the old French chancelier. At the Restoration the office of chancellor of France was restored, the chancellor being president of the House of Peers, but it was finally abolished at the revolution of 1848. The administration of the Legion of Honour is presided over by a grand chancelier, who is a grand cross of the order, and who advises the head of the state in matters concerning the affairs of the order. The title of chancelier continues also to be used in France for the large class of officials who discharge notarial duties in some public offices, in embassies and consulates. They draw up diplomas and prepare all formal documents, and have charge of the registration and preservation of the archives.

Spain.—In Spain the office of chancellor, canceller, was introduced by Alphonso VII. (1126-1157), who adopted it from the court of his cousins of the Capetian dynasty of France. The canceller did not in Spain go beyond being the king's notary. The chancellor of the privy seal, canceller del sello de la prudid (the title of the secret seal), was the king's secretary, and sealed all papers other than diplomas and charters. The office was abolished in 1496, and its functions were transferred to the royal secretaries. The cancelario was the chancellor of a university. The canceller succeeded the maestrescuela or scholasticus of a church or monastery. Cancellar mayor de Castilla is an honorary title of the archbishops of Toledo. The gran canceller de las Indias, high chancellor of the Indies, held the seal used for the American dominions of Spain, and presided at the council in the absence of the president. The office disappeared with the loss of Spain's empire in America.

Italy, Germany, &c.—In central and northern Europe, and in Italy, the office had different fortunes. In southern Italy, where Naples and Sicily were feudally organized, the chancellors of the Norman kings, who followed Anglo-Norman precedents very closely, and, at least in Sicily, employed Englishmen, were such officers as were known in the West. The similarity is somewhat clouded by the fact that the sovereign also adopted names and offices from the imperial court at Rome. Their chancellor was officially known as Protonotary and Logothete, and their example was followed by the German princes of the Hohenstaufen family, who acquired the kingdoms of Naples and Sicily. The papal or apostolic chancery is dealt with in the article on the Curia Romana (q.v.). It may be pointed out here, however, that the close connexion of the papacy with the Holy Roman Empire is illustrated by the fact that the archbishop of Cologne, who by right of his see was the emperor's arch-chancellor (Erz-Kanzler) for Italy, was confirmed as papal arch-chancellor by a bull of Leo IX. in 1052. The origin and duration of this connexion are, however, obscure; it appears to have ceased before 1187. The last record of a papal chancellor in the middle ages dates from 1212, from which time onward, for reasons much disputed, the head of the papal chancery bore the title vice-chancellor (Hinschius i. 439), until the office of chancellor was restored by the constitution Sulpianus of Pius X. in 1908.

The title of arch-chancellor (Erz-Kanzler) was borne by three great ecclesiastical dignitaries of the Holy Roman Empire.
The archbishop of Mainz was arch-chancellor for Germany. The archbishop of Cologne held the dignity for Italy, and the archbishop of Trier for Gaul and the kingdom of Arles. The second and third of these dignities became purely formal with the decline of the Empire in the 13th century. But the arch-chancellorship of Germany remained to some extent a reality till the Empire was finally dissolved in 1806. The office continued to be attached to the archbishopric of Mainz, which was an electorate. Karl von Dalberg, the last holder of the office, and the first prince primate of the Confederation of the Rhine, continued to act in show at least as chancellor of that body, and was after a fashion the predecessor of the Bundesarz Kanzler, or chancellor of the North German Confederation. The duties imposed on the imperial chancellery by the very complicated constitution of the Empire were, however, discharged by a vice-chancellor who was attached to the court of the emperor. The abbot of Fulda was chancellor to the empress.

The house of Austria in their hereditary dominions, and in those of their possessions which they treated as hereditary, even where the sovereignty was in theory elective, made a large and peculiar use of the title chancellor. The officers so called were of course distinct from the arch-chancellor and vice-chancellor of the Empire, although the imperial crown became in practice hereditary in the house of Habsburg. In the family states their administration was, to use a phrase familiar to the French, “polysonic.” As it was when fully developed, and as it remained until the March revolution of 1848, it was conducted through boards presided over by a chancellor. There were three aulic chancellories for the internal affairs of their dominions, “a united aulic chancellorship for all parts of the empire (i.e. of Austria, not the Holy Roman) not belonging to Hungary or Transylvania, and a separate chancellorship for each of those last-mentioned provinces” (Hartig, Genesis of the Revolution in Austria). There were also a house, a court, and a state chancellor for the business of the imperial household and foreign affairs, who were not, however, the presidents of a board. These “aulic” (i.e. court) officers were in fact secretaries of the sovereign, and administrative or political rather than judicial in character, though the boards over which they presided controlled judicial as well as administrative affairs. In the case of such statesmen as Kaunitz and Metternich, who were court, and state chancellors as well as “aulic” chancellors, the combination of offices made them in practice prime ministers, or rather lieutenants-general, of the sovereign. The system was subject to modifications, and in the end it broke down under its own complications. We are not dealing here with the confusing history of the Austrian administration, and these details are only quoted to show how it happened that in Austria the title chancellor came to mean a political officer and minister. There is obviously a vast difference between such an official as Kaunitz, who as house, court, and state chancellor was minister of foreign affairs, and as “aulic” chancellor had a general superiority over the whole machinery of government, and the lord high chancellor in England, the chancellor in France, or the canceller mayor in Castile, though the title was the same. The development of the office in Austria must be understood in order to explain the position and functions of the imperial chancellor (Reichskanzler) of the modern German empire. Although the present empire is sometimes rhetorically and absurdly spoken of as a revival of the medieval Empire, it is in reality an adaptation of the Austrian empire, which was a continuation under a new name of the hereditary Habsburg monarchy. The Reichskanzler is the immediate successor of the Bundesarz Kanzler, or chancellor of the North German Confederation (Bund). But the Bundesarzin Kanzler, who bore no sort of resemblance except in mere name to the Erz-Kanzler of the old Empire, was in a position not perhaps actually like that of Prince Kaunitz, but capable of becoming much the same thing. When the German empire was established in 1871 Prince Bismarck, who was Bundesarz Kanzler and became Reichskanzler, took care that his position should be as like as possible to that of Prince Kaunitz or Prince Metternich. The constitution of the German empire is separately dealt with, but it may be pointed out here that the Reichskanzler is the federal minister of the empire, the chief of the federal officials, and a great political officer, who directs the foreign affairs, and superintends the internal affairs, of the empire.

In these German states the title of chancellor is also given as in France to government and diplomatic officials who do notarial duties and have charge of archives. The title of chancellor has naturally been widely used in the German and Scandinavian states, and in Russia since the reign of Peter the Great. It has there as elsewhere wavered between being a political and a judicial office. Frederick the Great of Prussia created a Grosskanzler for judicial duty in 1746. But there was in Prussia a state chancellorship on the Austrian model. It was allowed to lapse on the death of Hardenberg in 1822. The Prussian chancellor after his time was one of the four court ministries (Hofämter) of the Prussian monarch. The English “Cancelleria,” q.v. “Cancelleria”; W. Stubbs, Const. Hist. of England (1874–1878); Rudolph Gneist, Hist. of the English Constitution (Eng. trans., London, 1861); L. O. Pike, Const. Hist. of the House of Lords (London, 1894); Sir William R. Amos, The Law and Custom of the Constitution, vol. ii. part i. (Oxford, 1907); A. Luchaire, Manuel des institutions francaises (Paris, 1892); K. F. Stumpf, Die Reichskanzler (3 vols. Innsbruck, 1865–1873); G. E. Seeliger, Erzkanzler und Reichskanzler (1883); P. Hinschius, Kirchenrecht (Berlin, 1866); Sir R. J. Phillimore, Eccles. Law (London, 1895); P. Fradier-Fodere, Cours de droit diplomatique, ii. 542 (Paris, 1899). CHANCELLORSVILLE, a village of Spotsylvania county, Virginia, U.S.A., situated almost midway between Washington and Richmond. It was the central point of one of the greatest battles of the Civil War, fought on the 2nd and 3rd of May 1863, between the Union Army of the Potomac under Major-General Hooker, and the Confederate Army of Northern Virginia under General Lee. (See American Civil War, and Wilderness.) General “Stonewall” Jackson was mortally wounded in this battle.

CHANCE-MEDLEY (from the A.-Fr. chance-médée, a mixed chance, and not from chaud-médée, a hot affray), an accident of a mixed character, an old term in English law for a form of homicide arising out of a sudden affray or quarrel. The homicide has not the characteristic of “malice prepense” which would raise the death to murder, nor the completely accidental nature which would reduce it to homicide by misadventure. It was practically identical, therefore, with manslaughter.

CHANCERY, in English law, the court of the lord chancellor of England, consolidated in 1875 along with the other superior courts in the Supreme Court of Judicature. Its origin is noticed under the head of Chancellor.

It has been customary to say that the court of chancery consists of two distinct tribunals—one a court of common law, the other a court of equity. From the former have issued all the original writs passing under the great seal, all commissions of sewers, lunacy, and the like—some of these writs being originally kept in a hanaper or hamper (whence the “hanaper office”), and others in a little sack or bage (whence the “petty-bage office”). The court had likewise power to hold pleas upon scire facias (q.v.) for repeal of letters patent, &c. “So little,” says Blackstone, “is commonly done on the common law side of the court that I have met with no traces of any writ of error being actually brought since the fourteenth year of Queen Elizabeth.”

The equitable jurisdiction of the court of chancery was founded on the supposed superiority of conscience and equity over the strict law. The appearance of equity in England is in harmony with the general course of legal history in progressive societies. What is remarkable is that, instead of being incorporated or superseding the common law, it was subordinated to it in a measure. The English dislike of the civil law, and the tendency to follow precedent which has never ceased to characterize English lawyers, account for this unfortunate separation. The claims of equity in its earlier stages are well expressed in the little treatise called Doctor and Student, published in the reign of Henry VIII.:—“Conscience never resisteth the law nor addeth to it, but only when the law is
CHANCERY

836
directly in itself against the law of God, or law of reason." So also King James, speaking in the Star Chamber, says: "Where the rigour of the law in many cases will undo a subject, then the chancery tempers the law with equity, and so mixes mercy with justice, as it preserves a man from destruction." This theory of the essential opposition between law and equity, and of the natural superiority of the latter, remained long after equity had ceased to find itself on natural justice, and had become as fixed and rigid as the common law itself. The jealousy of the common lawyers came to a head in the time of Lord Ellesmere, when Coke made the right of the chancery to give relief against a judgment of the court of queen's bench obtained by gross fraud and imposition. James I., after consultation, decided in favour of the court of equity. The substitution of lay for clerical chancellors is regarded by G. Spence (Equitable Jurisdiction of the Court of Chancery, 2 vols., 1846–1849) as having at first been unfortunate, inasmuch as the laymen were ignorant of the principles on which their predecessors had acted. Lord Nottingham (1621–1682) is usually credited with the first attempt to reduce the decisions of the court to order, and his work was continued by Lord Hardwicke (1690–1764). By the time of Lord Eldon equity had become fixed, and the judges, like their brethren in the House of Lords, were held to be judge and precedent. Henceforward chancery and common law courts have exhibited the anomaly of two co-ordinate sets of tribunals, empowered to deal with the same matters, and compelled to proceed in many cases on wholly different principles. The court of chancery could in most cases prevent a person from taking advantage of a common law right, not approved of by its own system. But if a suitor chose to go to a court of common law, he might claim such unjust rights, and it required the special intervention of the court of equity to prevent his enforcing them. In many cases also a special application had to be made to chancery for facilities which were absolutely necessary to the successful conduct of a case at common law. Another source of difficulty and annoyance was the uncertainty in many cases whether the chancery or common law courts were the proper tribunal, so that a suitor often found at the close of an expensive and protracted suit that he had misjudged his course and must go elsewhere for relief. Attempts more or less successful were made to lessen those evils by giving the powers to both courts of equity, so that the common law courts have to a certain extent been modified by a consolidation effected by the Judicature Act, 1873. English judicial system justified the sarcasm of Lord Westbury, that one tribunal was set up to do injustice and another to stop it.

The equitable jurisdiction of chancery was commonly divided into exclusive, concurrent and auxiliary. Chancery had exclusive jurisdiction when there were no forms of action by which relief could be obtained at law, in respect of rights which ought to be enforced. Trusts were the most conspicuous example of this class. It also included the rights of married women, infants and lunatics. Chancery had concurrent jurisdiction when the common law did not give adequate relief, e.g. in cases of fraud, accident, mistake, specific performance of contracts, &c. It had auxiliary jurisdiction when the administrative machinery of the law courts was unable to procure the necessary evidence.

The Judicature Act 1873 enacted (§ 24) that in every civil cause or matter commenced in the High Court of Justice, law and equity should be administered by the High Court of Justice and the court of appeal respectively, according to the rules therein contained, which provide for giving effect in all cases to "equitable rights and other matters of equity." The 25th section declared the law hereafter to be administered in England on certain points, and ordained that "generally in all matters not hereinbefore particularly mentioned in which there is any conflict or variance between the rules of equity and the rules of the common law with reference to the same matter, the rules of equity shall prevail." The 34th section specifically assigned to the chancery division the following causes and matters—

- The administration of the estates of deceased persons;
- The dissolution of partnerships, or the taking of partnership, or other accounts;
- The redemption or foreclosure of mortgages;
- The raising of portions, or other charges on land; the sale and distribution of the proceeds of property subject to any lien or charge; the execution of trusts, charitable or private;
- The rectification, or setting aside, of a sale or encumbrance of deeds or other written instruments; the specific performance of contracts between vendors and purchasers of real estates, including contracts for leases; the partition or sale of real estates; the wardship of infants and the care of infants' estates.

The chancery division originally consisted of the lord chancellor as president and the master of the rolls, and the three vice-chancellors. The master of the rolls was also a member of the court of appeal, but Sir George Jessel, who held that office when the new system came into force, regularly sat as a judge of first instance until 1881, when, by the act of that year (sec. 2), the master of the rolls became a member of the court of appeal only, and provision was made for the appointment of a judge to supply the vacancy thus occasioned (sec. 3). Sir James Bacon (1795–1895) was the last survivor of the vice-chancellors. He retired his seat on the bench until the year 1886, when he retired after more than seventeen years' judicial service. For some reason the solicitors, when they had the choice, preferred to bring their actions in the chancery division. The practice introduced by the Judicature Act of trying actions with oral evidence, and a certificate of the completion of affidavits, and the comparative inexpediency of the chancery courts of trial, tended to lengthen the time required for the disposal of the business. Demand was consequently made for more judges in the chancery division.

By an act of 1877 the appointment of an additional judge in that division was authorized, and Sir Edward Fry (afterwards better known as a lord justice) was appointed. In August 1890 the crown consented to the appointment of a new judge of the High Court in the chancery division on an address from both Houses of Parliament, pursuant to the 8th section of the Appellate Jurisdiction Act 1876. The chancery division, therefore, consists of the lord chancellor and six puisne judges. The latter are styled and addressed in the same manner as was customary in the old common law courts. Formerly there were only four judges of this division (being the successors of the master of the rolls and the three vice-chancellors) to whom chambers were attached. The fifth judge heard only causes with witnesses transferred to him from the overflown suits of his four brethren. In each set of chambers there were three chief clerks, with livery and under them. The chief clerks had no original jurisdiction, but their applications on behalf of the judge to whose chambers they belonged, and theoretically every suitor had the right to have his application heard by the judge himself in chambers. But the appointment of a sixth judge enabled the lord chancellor to carry out a reform recommended by a departmental committee which reported in 1885. The great difficulty in the chancery division always was to secure the continuous hearing of actions with witnesses, as nearly one-half of the judge's time was taken up with cases adjourned to him from chambers and other administrative business and non-witness actions and motions. The interruption of a witness action for two or three days, particularly in a country case, occasioned great expense, and had other inconveniences. It was a simple remedy to link the judges in pairs with one list of causes and one set of chambers assigned to each pair. This reform was effected by the alteration of a few rules in certain rules of court. There are, therefore, only three sets of chambers, each containing four chief clerks, or, as they are now styled, masters of the Supreme Court, and one of the linked judges, by arrangement between themselves, continuously tries the witness actions in their communal list, while the other attends in chambers, and also hears the motions, petitions, adjourned summonses and non-witness cases.

Although styled masters it does not appear that the chief

1 The comte de Franqueville comments on the misuse of the title "Lord" in addressing judges as another anomaly which only adds to the confusion, but perhaps unnecessarily. According to Foss (vol. viii. p. 200) it was only in the 18th century that the judges began to be addressed by the title of "Your Lordship." In the Year Books (he adds) they are constantly addressed by the title of "Sir." "Sir, vous voyez bien," &c.
clerks have any larger or different jurisdiction than they had before. They are still the representatives of and responsible to the judges to whom the chambers are attached. The judge may either hear an application in chambers, or may direct any matter which he thinks of sufficient importance to be argued before him in court, or a party may move in court to discharge an order made in chambers with a view to an appeal, but this is not required if the judge certifies that the matter was sufficiently discussed before him in chambers.

Under the existing rules of court many orders can now be made on summons in chambers which used formerly to require a suit or petition in court (see Order LV. as to foreclosure, administration, payment out of money in court and generally). The judge is also enabled to decide any particular question arising in the administration of the estate of a deceased person or execution of the trusts of a settlement without directing administration of the whole estate or execution of the trusts generally by the court (Order LV. rule 10), and where an application for accounts is made by a dissatisfied beneficiary or creditor to order the accounts to be delivered out of court, and the application to stand over till it can be served with questions (if any) arise upon the accounts requiring the intervention of the court (Order LV. 2, 100). Delay and consequent worry and expense are thus saved to the parties, and, at the same time, a great deal of routine administration is got rid of and a larger portion of the judicial term can be devoted to hearing actions and deciding any question of importance in court. The work of the chambers staff of the judges has probably been increased; but, on the other hand, it has been lightened by the removal of the winding-up business. The chancery division has also inherited from the court of chancery a staff of registrars and taxing masters.

In the United States "chancery" is generally used as the synonym of "equity." Chancery practice is practice in cases of equity. Chancery courts are equity courts (see EQUITY). For the diplomatic sense of chancery (chancellery) see CHANCELLOR.

CHANDA, a town and district of British India, in the Nagpur division of the Central Provinces. In 1901 the town had a population of 17,853. It is situated at the junction of the Vind and Jharpat rivers. It was the capital of the Gond kingdom of Chanda, which was established on the ruins of a Hindu state in the 11th or 12th century, and survived until 1751 (see GONDAWA). The town is still surrounded by a stone wall 340 m. in circuit. It has several old temples and tombs, and the district at large is rich in remains of antiquity. There are manufactures of cotton, silk, brass-ware and leather slippers, and a considerable local trade.

The District of Chanda has an area of 10,136 sq. m. Excepting in the extreme west, hills are thickly dotted over the country, sometimes in detached ranges, occasionally in isolated peaks rising sheer out from the plain. Towards the east they increase in height, and form a broad tableland, at places 2000 ft. above sea-level. The Wainganga river flows through the district from north to south, meeting the Wardha river at Seoni, where their streams unite to form the Pranhita. Chanda is thickly studded with lakes and tanks, or rather artificial lakes, formed by closing the outlets of small valleys, or by throwing a dam across tracts intersected by streams. The broad clear sheets of water thus created are often very picturesque in their surroundings of wood and rock. The chief architectural objects of interest are the cave temples at Bhandak, Winjbasnai, Dewala and Ghughus; a rock temple in the bed of the Wardha river below Ballapur; the ancient temples at Markambi, Ambgaon and elsewhere; the forts of Wairagarh and Ballapur; and the old walls of the city of Chanda, its system of waterworks, and the tombs of the Gond kings. In 1901 the population was 601,533, showing a decrease of 15% in the decade. The principal crops are rice, millet, pulse, wheat, oil-seeds and cotton. The district contains the coalfield of Warora, which was worked by government till 1906, when it was closed. Other fields are known, and iron ores also occur. The district suffered severely from famine in 1900, when in April the number of persons relieved rose to 90,000.

CHANDAUSI, a town of British India, in the Moradabad district of the United Provinces, 28 m. south of Moradabad. Pop. (1901) 2,571. It is an important station on the Oudh & Rohilkhand railway, with a junction for Aligarh. Its chief exports are of cotton, hemp, sugar and stone. There is a factory for pressing cotton.

CHAND BARDAI (fl. c. 1200), Hindu poet, was a native of Lahore, but lived at the court of Prithwi Raja (Prithiraj), the last Hindu sovereign of Delhi. His Prithiraj Rosas, a poem of some 100,000 stanza, chronicling his master's deeds and the contemporary history of his part of India, is valuable not only as historical material but as the earliest monument of the Western Hindi language, and the first of the long series of bardic chronicles for which Rajputana is celebrated. It is written in ballad form, and portions of it are still sung by itinerant bards throughout north-western India and Rajputana.

CHANDELIER, a frame of metal, wood, crystal, glass or china, pendent from roof or ceiling for the purpose of hanging lights. The word is French, but the appliance has lost its original significance of a candle-holder, the chandelier being now chiefly used for gas and electric lighting. Clusters of hanging lights were in use as early as the 14th century, and appear originally to have been almost invariably of wood. They were, however, so speedily ruined by grease that metal was gradually substituted, and fine and comparatively early examples in beaten iron, brass, copper and even silver are still extant. Throughout the 17th century the hanging candle-holder of brass or bronze was common throughout northern Europe, as innumerable pictures and engravings testify. In the great periods of the art of decoration in France many magnificent chandeliers were made by Bouille, and at a later date by Gouthière and Thomire and others among the extraordinarily clever fondeurs-ciseleurs of the second half of the 18th century. The chandelier in rock crystal and its imitations had come in at least a hundred years before their day, and continued in favour to the middle of the 19th century, or even somewhat later. It reached at last the most extreme elaboration of banality, with ropes of pendants and hanging faceted drops often called lustres. When many lights were burning in one of these chandeliers an effect of splendour was produced that was not out of place in a ballroom, but the ordinary household varieties were extremely ugly and inartistic. The more purely domestic chandelier usually carries from two to six lights. The rapidly growing use of electricity as an illuminating medium and the preference for smaller clusters of lights have, however, pushed into the background an appliance which had grown extremely commonplace in design, and had become out of character with modern ideas of household decoration.

CHANDERNAGORE, or CHANDARKNAR, a French settlement in India, with a small adjoining territory, situated on the right bank of the river Hugli, 20 m. above Calcutta, in 22° 31' 40" N. and 88° 24' 50" E. Area 3 sq. m.; pop. (1901) 25,000. Chandernagore has played an important part in the European history of Bengal. It became a permanent settlement in 1668, but did not rise to any importance till the time of Dupleix, during whose administration more than two thousand brick houses were erected in the town and a considerable maritime trade was carried on. In 1757 Chandernagore was bombarded by an English fleet under Admiral Watson and captured; the fortifications and houses were afterwards demolished. On peace being established the town was restored to the French in 1763. When hostilities afterwards broke out in 1794, it was again taken possession of by the English, and was held by them till 1816, when it was a second time given up to the French; it has ever since remained in their possession. All the former commercial grandeur of Chandernagore has now passed away, and at present it is little more than a quiet suburb of Calcutta, without any external trade. The European town is situated at the bottom of a beautiful reach of the Hugli, with clean wide thoroughfares, and many elegant
residences along the river-bank. The authorities of Chandernagore are subject to the jurisdiction of the governor-general of Pondicherry, to whom is confided the general government of all the French possessions in India.

CHANDLER, HENRY WILLIAM (1828–1889), English scholar, was born in London on the 31st of January 1828. In 1848 he entered Pembroke College, Oxford, where he was elected fellow in 1853. In 1867 he succeeded H. L. Mansel as Waynflete professor of moral and metaphysical philosophy, and in 1884 was appointed curator of the Bodleian library. He died by his own hand in Oxford on the 16th of May 1889. He was chiefly known as an Aristotelian scholar, and his knowledge of the Greek commentators on Aristotle was profound. He collected a vast amount of material for an edition of the fragments of his favourite author, but on the appearance of Valentine Rose's work in 1886 he abandoned the idea. Two works on the bibliography of Aristotle, *A Catalogue of Editions of Aristotle's Nicomachean Ethics and of Works illustrative of them printed in the 15th century* (1868), and *A Chronological Index to Editions of Aristotle's Nicomachean Ethics, and of Works illustrative of them from the Origin of Printing to 1799* (1878), are of great value. Chandler's collection of works on Aristotelian literature is now in the library of Pembroke College. His *Practical Introduction to Greek Accents* (1863, ed. 1877) is the standard work in English.

CHANDLER, RICHARD (1738–1810), British antiquary, was born in 1738 at Elson in Hampshire, and educated at Winchester and at Queen's and Magdalen Colleges, Oxford. His first work consisted of fragments from the minor Greek poets, with notes (*Elegiaca Graeca*, 1759); and in 1765 he published a fine edition of the Arundelian marbles, *Marmora Ovonioensis*, with a Latin translation, and a number of suggestions for supplying the lacunae. He was sent by the Dilettante Society with Nicholas Revett, an architect, and Pars, a painter, to explore the antiquities of Ionia and Greece (1763–1766); and the result of their work was the two magnificent folios of Ionian antiquities published in 1769. He subsequently held several church preferments, including the rectory of Tylehurst, in Berkshire, where he died on the 9th of February 1810. Other works by Chandler were *Inscriptions Antiquae pleraque nondum editae* (Oxford, 1774); *Travels in Asia Minor* (1775); *Travels in Greece* (1776); *History of Illyria* (1801), in which he asserted the accuracy of Homer's geography. His *Life of Bishop Waynflete*, lord high chancellor to Henry VI., appeared in 1811. A complete edition (with notes by Revett) of the *Travels in Asia Minor and Greece* was published by R. Curton (Oxford, 1825), with an "Account of the Author."

CHANDLER, SAMUEL (1603–1766), English Nonconformist divine, was born in 1603 at Hungerford, in Berkshire, where his father was a minister. He was sent to school at Gloucester, where he began a lifelong friendship with Bishop Butler and Archbishop Secker; and he afterwards studied at Leiden. His talents and learning were such that he was elected fellow of the Royal and Antiquarian Societies, and was made D.D. of Edinburgh and Glasgow. He also received offers of high preferment in the Church of England. These he refused, remaining to the end of his life in the position of a Presbyterian minister. He was moderately Calvinistic in his views and leaned towards Arminianism. He took a leading part in the deist controversies of the time, and disputed with several of the bishops the possibility of an act of comprehension. From 1716 to 1726 he preached at Pockham, and for forty years he was pastor of a meeting-house in Old Jewry. During two or three years, having fallen into pecuniary distress through the failure of the South Sea scheme, he kept a book-shop in the Poultry. On the death of George II. in 1760 Chandler published a sermon in which he compared that king to King David. This view was attacked in a pamphlet entitled *The History of the Man after God's own Heart*, in which the author complained of the parallel as an insult to the late king, and, following Pierre Bayle, exhibited King David as an example of perfidy, lust and cruelty. Chandler condescended to reply first in a review of the tract (1762) and then in *A Critical History of the Life of David*, which is perhaps the best of his productions. This work was just completed when he died, on the 8th of May 1766. He left 4 vols. of sermons (1768), and a paraphrase of the Epistles to the Galatians and Ephesians (1777), several works on the evidences of Christianity, and various pamphlets against Roman Catholicism.

CHANDLER, ZACHARIAS (1715–1789), American politician, was born at Bedford, New Hampshire, on the 16th of December 1713. In 1733 he removed to Detroit, Michigan, where he became a prosperous dry-goods merchant. He took a prominent part as a Whig in politics (serving as mayor in 1751), and, impelled by his strong anti-slavery views, actively furthered the work of the "Underground Railroad," of which Detroit was one of the principal "transfer" points. He was one of the organizers in Michigan of the Republican party, and in 1837 succeeded Lewis Cass in the United States Senate, serving until 1875, and at once taking his stand with the most radical opponents of slavery extension. When the Civil War became inevitable he endeavoured to impress upon the North the necessity of taking extraordinary measures for the preservation of the Union. After the fall of Fort Sumter he advocated the enlistment of 500,000 instead of 75,000 men for a long instead of a short term, and the vigorous enforcement of confiscation measures. In July 1862 he made a bitter attack in the Senate on General George B. McClellan, "an enthusiastic supine imbecility and lack of nerve." Throughout the war he allied himself in the interests of the Republican faction in opposition to President Lincoln's policy, and subsequently became one of the bitterest opponents of President Johnson's plan of reconstruction. From October 1875 to March 1877 he was secretary of the interior in the cabinet of President Grant, succeeding Columbus Delano (1860–1869). In 1876, as chairman of the national republican committee, he managed the campaign of Hayes against Tilden. In February 1870 he was re-elected to the Senate to succeed Isaac P. Christiany (1812–1890), and soon afterwards, in a speech concerning Mexican War pensions, bitterly denounced Jefferson Davis. He died at Chicago, Illinois, on the 1st of November 1879. By his extraordinary force of character he exercised a wide personal influence during his lifetime, but failed to stamp his personality upon any measure or policy of lasting importance.

CHANDOS, BARONS AND DUKES OF. The English title of Chandos began as a barony in 1554, and was continued in the family of Brydges (becoming a dukedom in 1719) till 1879. In 1822 the dukedom was revived in connexion with that of Buckingham.

JOHN BRYDGES, 1st Baron Chandos (c. 1490–1557), a son of Sir Giles Brydges, or Bruges (d. 1511), was a prominent figure at the English court during the reigns of Henry VIII., Edward VI., and Mary. He took part in suppressing the rebellion of Sir Thomas Wyatt in 1554, and as lieutenant of the Tower of London during the earlier part of Mary's reign, had the custody, not only of Lady Jane Grey and of Wyatt, but for a short time of the princess Elizabeth. He was created Baron Chandos of Sudeley in 1554, one of his ancestors, Alice, being a grand-daughter of Sir Thomas Chandos (d. 1575), and he died in March 1557. The three succeeding barons, direct descendants of the 1st baron, were all members of parliament and persons of some importance.

Grey, 3rd Baron Chandos (c. 1580–1621), lord-lieutenant of Gloucestershire, was called the "king of the Cotswolds," owing to his generosity and his magnificent style of living at his residence, Sudeley Castle. He has been regarded by Horace Walpole and others as the author of some essays, *Horae Subseciae*. His elder son George, 6th Baron Chandos (1620–1655), was a supporter of Charles I. during his struggle with Parliament, and distinguished himself at the first battle of Newbury in 1643. He had six daughters but no sons, and after the death of his brother William in 1676 the barony came to a kinsman, Sir James Brydges, Bart. (1642–1714), who was English ambassador to Constantinople from 1680 to 1685.

JAMES BRYDGES, 1st Duke of Chandos (1673–1744), son and heir of the last-named, had been member of parliament for Hereford from 1658 to 1744, and, three days after his father's death, was created Viscount Wilton and earl of Carmarvon. For eight years, from 1705 to 1713, during the War of the Spanish
CHANDOS, SIR J.—CHANG-CHOW

Succession, he was paymaster-general of the forces abroad, and in this capacity he amassed great wealth. In 1719 he was created marquess of Carnarvon and duke of Chandos. The duke is chiefly remembered on account of his connexion with Handel and with Pope. He built a magnificent house at Canons near Edgeware in Middlesex, and is said to have contemplated the construction of a private road between this place and his unfinished house in Cavendish Square, London. For over two years Handel, employed by Chandos, lived at Canons, where he composed his oratorio Esther. Pope, who in his Moral Essays (Epistle to the Earl of Burlington) doubtless described Canons under the guise of “Timon’s Villa,” referred to the duke in the line, “Thus gracious Chandos is belov’d at sight”; but Swift, less complimentary, called him “a great complier with every court.” The poet was caricatured by Hogarth for his supposed servility to the duke. Chandos, who was lord-lieutenant of the counties of Hereford and Radnor, and chancellor of the university of St. Andrews, became involved in financial difficulties, and after his death on the 9th of August 1744 Canons was pulled down. He was succeeded by his son Henry, 2nd duke (1708–1771), and grandson James, 3rd duke (1733–1780). On the death of the latter without sons in September 1789 all his titles, except that of Baron Kinloss, became extinct, although a claimant arose for the baronetcy. The heir female was the kinsman, Elizabeth, who became Baroness Kinloss on her father’s death, was married in 1796 to Richard Grenville, afterwards marquess of Buckingham; and in 1822 this nobleman was created duke of Buckingham and Chandos (see BUCKINGHAM, DUKE OF).

See G. E. Cokayne, Complete Peerage (1887–1898); and J. R. Robinson, The Princely Chandos, i.e. the 1st duke (1893).

CHANDOS, SIR JOHN (?–1370), one of the most celebrated English commandos of the 14th century. *He is found at the siege of Cambrai in 1337, and at the battle of Crécy in 1346. At the battle of Poitiers, in 1356, it was he who decided the day and saved the life of the Black Prince. For these services Edward III. made him a knight of the Garter, gave him the lands of the viscount of Saint Saurve in Cotentin, and appointed him his lieutenant in France and vice-chamberlain of the royal household. In 1362 he was made constable of Aquitaine, and won the victories of Auray (1364) and Navarette in Spain (1367) over Duguesclin. He was seneschal of Poitou in 1369, and was mortally wounded at the bridge of Lussac near Poitiers on the 31st of December. He died on the following day, the 1st of January 1370.*

See Benjamin Fillon, “John Chandos, Connoisseur of Aquateine et Sénéchal de Poitou,” in Revue des provinces de l’ouest (1855).

CHANDRAGUPTA MAURY (reigned 321–296 B.C.), known to the Greeks as Sandracottus, founder of the Maurya empire and first paramount ruler of India, was the son of a king of Magadha by a woman of humble origin, whose caste he took, and whose name, Muni, is said to have been the origin of that of Maurya assumed by his dynasty. As a youth he was driven into exile by his kinsman, the reigning king of Magadha. In the course of his wanderings he met Alexander the Great, and, according to Plutarch (Alexander, cap. 62), encouraged him to invade the Ganges kingdom by enlisting on the extreme unpopularity of the reigning monarch. During his exile he collected a large force of the warlike clans of the north-west frontier, and on the death of Alexander attacked the Macedonian garrisons and conquered the Punjab. He next attacked Magadha, de-throned and slew the king, his enemy, with every member of his family, and established himself as the king (321 B.C.). His great avarice with his predecessor he increased until it reached the total of 30,000 cavalry, 9000 elephants, and 600,000 infantry; and with this huge force he overrun all northern India, establishing his empire from the Arabian Sea to the Bay of Bengal. In 305 Seleucus Nicator crossed the Indus, but was defeated by Chandragupta and forced to humiliate peace (303), by which the empire of the latter was still farther extended in the north. About six years later Chandragupta died, leaving his empire to his son Bindusura.

An excellent account of the court and administrative system of Chandragupta has been preserved in the fragments of Megasthenes, who came to Pataliputra as the envoy of Seleucus shortly after 323. The government was, of course, autocratic and even tyrannical, but it was organized on an elaborate system, army and civil service being administered by a series of boards, while the cities were governed by municipal commissioners responsible for public order and the upkeep of public works. Chandragupta himself is described as living in barbaric splendour, appearing in public only to hear causes, offer sacrifice, or to go on military and hunting expeditions, and withal so fearful of assassination that he never slept two nights running in the same room.

See J. W. MacCullagh, Ancient India as described by Megasthenes and Arrian (Calcutta, 1877); V. A. Smith, Early Hist. of India (Oxford, 1908); also the articles INDIA: History, and Inscriptions: Indian.

CHANGARNIER, NICOLAS ANNE THÉODULE (1792–1877), French general, was born at Autun on the 26th of April 1793. Educated at St Cyr, he served for a short time in the bodyguard of Louis XVIII, and entered the line as a lieutenant in January 1815. He achieved distinction in the Spanish campaign of 1823, and became captain in 1825. In 1830 he entered the Royal Navy, and afterwards saw service in Africa, where he took part in the Maccasca expedition. Promoted colonel in 1835, he distinguished himself under Marshal Clausel in the campaign against Ahmed Pasha, bey of Constantine, and became lieutenant-colonel in 1837. The part he took in the expedition of Portes-de-Fer gained him a colonelcy, and his success against the Hujatas and Kabyles, the cross of the Legion of Honour. Three more years of brilliant service in Africa won for him the rank of maréchal de camp in 1840, and of lieutenant-general in 1843. In 1847 he held the Algerian divisional command. He visited France early in 1848, assisted the provisional government to establish order, and returned to Africa in May to succeed General Cavaignac in the government of Algeria. He was speedily recalled on his election to the general assembly for the department of the Seine, and received the command of the National Guard of Paris, to which was added soon afterwards that of the troops in Paris, altogether nearly 100,000 men. He held a high place and exercised great influence in the complicated politics of the next two years. In 1849 he received the grand cross of the Legion of Honour. An avowed enemy of republican institutions, he held a unique position in upholding the power of the president; and in January 1852 he opposed the Napoleonic policy, was in consequence deprived of his double command, and at the coup d’état in December was arrested and sent to Mazas, until his banishment from France by the decree of the 9th of January 1852. He returned to France after the general amnesty, and resided in his estate in the department of Saône-et-Loire. In 1870 he held no command, but was present with the headquarters, and afterwards with Bazaine in Metz. He was employed on an unsuccessful mission to Prince Frederick Charles, commanding the German army which besieged Metz, and on the capitulation became a prisoner of war. At the armistice he returned to Paris, and in 1871 was elected to the National Assembly by four departments, and sat for the Somme. He took an active part in politics, defended the conduct of Marshal Bazaine, and served on the committee which elaborated the constitutional constitution. When the comte de Chambord refused the compromise, he moved the resolution to extend the executive power for ten years to Marshal MacMahon. He was elected a life senator in 1875. He died of cholera on the 14th of February 1877.

CHANG-CHOW, a town on the town of Chong-cha (see CHANG-SHA), is a province of Fu-kien, on a branch of the Lung Kiang, 34 m. W. of Amoy. It is surrounded by a wall 43 ft. in circumference, which, however, includes a good deal of open ground. The streets are paved with granite, but are very dirty. The river is crossed by a curious bridge, 800 ft. long, constructed of wooden planks supported on twenty-five piles of stones about 30 ft. apart. The city is a centre of the silk-trade, and carries on an extensive commerce in different directions. Brick-works and sugar-factories are among its chief
CHANG-CHUN—CHANNEL ISLANDS

industrial establishments. Its population is estimated at about 1,000,000.

CHANG CHUN, KIU (1148-1227), Chinese Taoist sage and traveller, was born in 1148. In 1210 he was invited by Jenghiz Khan, founder of the Mongol empire and greatest of Asiatic conquerors, to visit him. Jenghiz's letter of invitation, dated the 15th of May 1210 (by present reckoning), has been preserved, and is among the curiosities of history; here the terrible warrior appears as a meek disciple of wisdom, modest and simple, almost Socratic in his self-examination, alive to many of the deepest truths of life and government. Chang Chun obeyed this summons; and leaving his home in Shantung (February 1220) journeyed first to Peking. Learning that Jenghiz had gone far west upon fresh conquests, the sage stayed the winter in Peking. In February 1221 he started again and crossed eastern Mongolia to the camp of Jenghiz' brother Ujughen, near Lake Bör or Buyur in the upper basin of the Kerulun-Amur. Thence he travelled south-westward up the Kerulun, crossed the Karakorum region in north-central Mongolia, and so came to the Chinese Altai, probably passing near the present Ulissatoo. After traversing the Soo-Chen (or Khalka) huts, and passing to the north of the Tian Shan, and moved along the north side of the Tian Shan range to lake Sairam, Almalig (or Kulja), and the rich valley of the Ili. We then trace him to the Chu, over this river to Talas and the Tashkent region, and over the Jaxartes (or Syr Daria) to Samar-kand, where he halted for some months. Finally, through the "Iron Gates" of Termit, over the Oxus, and by way of Balkh and northern Afghanistan, Chang Chun reached Jenghiz' camp near the Hindu Kush. Returning home he followed much the same course as on his outward route: certain deviations, however, occur, such as a visit to Kuku-kho. He was back in Peking by the end of January 1224. From the narrative of his expedition (the Si yu ki, written by his pupil and companion Li Chi Chang) we derive some of the most faithful and vivid pictures ever drawn of nature and man between the Great Wall of China and Kabul, between the Aral and the Yellow Sea: we may particularly notice the sketches of the Mongols, and of the people of Samar-kand and its neighbourhood; the account of the fertility and products of the latter region, as of the Ili valley, at or near Almalig-Kulja, and the description of various great mountain ranges, peaks and defiles, such as the Chinese Altai, the Tian Shan, Mt Bogdo-ola (?), and the Iron Gates of Termit. There is, moreover, a noteworthy reference to a land apparently identical with the uppermost valley of the Yenisei. After his return Chang Chun lived at Peking till his death on the 23rd of July 1227. By order of Jenghiz some of the former imperial garden grounds were made over to him, for the foundation of a Taoist monastery.

See E. Bretschneider, Medieval Researches from Eastern Asiatic Sources, vol. i. pp. 35-108, where a complete translation of the narrative is given, with a valuable commentary; C. R. Beasley, Dawn of Modern Geography, iii. 539. (C. R. B.)

CHANGE (derived through the Fr. from the Late Lat. comibium, cambiare, to barter; the ultimate derivation is probably from the root which appears in the Gr. καθάρεω, to bend), properly the substitution of one thing for another, hence any alteration or variation, so applied to the moon's passing from one phase to another. The use of the word for a place of exchange has usually been taken to be a shortened form of Exchange (p.v.) and so is often written 'Change'. The New English Dictionary points out that "change" appears earlier than "exchange" in this sense. "Change" is particularly used of coins of lower denomination given in substitution for those of larger denomination or for a note, cheque, &c., and also for the balance of a sum paid larger than that which is due. A further application is that in bell-ringing, of the variations in order in which a peal of bells may be rung. The term usually excludes the ringing of the bells according to the diatonic scale in which they are hung (see Bell). It is from a combination of these two meanings that the thieves' slang phrase "ringing the changes" arises; it denotes the various methods by which wrong change may be given or extracted, or counterfeit coin passed.

CHANGELING, the term used of a child substituted or changed for another, especially in the case of substitutions popularly supposed to be through fairy agency. There was formerly a widespread superstition that infants were sometimes stolen from their cradles by the fairies. Any specially peevish or weakly baby was regarded as a changeling, the word coming at last to be almost synonymous with imbecility. It was thought that the elves could only effect the exchange before christening, and in the highlands of Scotland babies were strictly watched till then. Strype states that in his time midwives had to take an oath binding themselves to be no party to the theft or exchange of babies. The belief is referred to by Shakespeare, Spenser and other authors. Pennant, writing in 1796, says: "In this very century a poor cottager, who lived near the spot, had a child who grew uncommonly peevish; the parents attributed this to the fairies and imagined it was a changeling. They took the child, put it in a cradle, and left it all night beneath the "Fairy Oak" in hopes that the Tywydd led or fairy family would restore their own before morning. When morning came they found the child perfectly quiet, so went away with it, quite satisfied in their minds.

See W. Wirt Sikes, British Goblins (1880).

CHANGOS, a tribe of South American Indians who appear to have originally inhabited the Peruvian coast. A few of them still live on the coast of Atacama, northern Chile. They are a dwarfish race, never exceeding 4 ft. in height. Their sole occupation is fishing, and in former times they used boats of inflated sealskins, lived in sealskin huts, and slept on heaps of dried seaweed. They are hospitable and friendly people, and never resisted the whites.

CHANGRA, or KANGHAI (anc. Gangra; called also till the time of Caracalla, Germaniaecopis, after the emperor Claudius), the chief town of a sanjak of the same name in the Kastamuni vilayet, Asia Minor, situated in a rich, well-watered valley; altitude 2500 ft. The ground is impregnated with salt, and the town is, unhealthy. Pop. (1894) 15,632, of whom 1086 are Christians (Cuinet). Gangra, the capital of the Paphlogonian kingdom of Deiotaurus Philadelphia, son of Castor, was taken into the Roman province of Galatia on his death in 6-5 B.C. The earlier town, the name of which signified "she-goat," was built on the hill behind the modern city, on which are the ruins of a late fortress; while the Roman city occupied the site of the modern. In Christian times Gangra was the metropolitan see of Paphlogonia. In the 4th century the town was the scene of an important ecclesiastical synod.

Synod of Gangra.—Conjectures as to the date of this synod vary from 341 to 376. All that can be affirmed with certainty is that it was held about the middle of the 4th century. The synodal letter states that twenty-one bishops assembled to take action concerning Eustathius (of Sebastea?) and his followers, who contemned marriage, disparaged the offices of the church, held conventicles of their own, wore a peculiar dress, denounced riches, and affected especial sanctity. The synod condemned the Eustathian practices, declaring, however, with remarkable moderation, that it was not virginity that was condemned, but the dishonouring of marriage; not poverty, but the disparagement of honest and benevolent wealth; not asceticism, but profanation of life; not contempt of the world, but dishonouring the house of God. The twenty canons of Gangra were declared ecumenical by the council of Chalcedon, 451.

CHANNEL ISLANDS (French îles Normandes), a group of islands in the English Channel, belonging (except the Æles Chausey) to Great Britain. (For map, see England, Section VI.) They lie between 50° 50' and 49° 45' N., and 2° 50' and 2° 45' W., along the French coast of Cotentin (department of Manche), at a distance of 4 to 40 m. from it, within the great rectangular bay of which the northward horn is Cape La Hague. The greater part of this bay is shallow, and the currents among the numerous groups of islands and rocks are often dangerous to navigation. The nearest point of the English coast to the Channel Islands
is Portland Bill, a little over 50 m. north of the northernmost outlier of the islands. The total land area of the islands is about 75 sq. m. (4,083 acres), and the population in 1901 was 95,628.

The principal individual islands are Herm (area 31 sq. m., pop. 45), Guernsey (area 34.5 sq. m., pop. 40,446), Alderney (area 2.9 sq. m., pop. 2062), and Sark (area nearly 2.5 sq. m., pop. 504). Each of these islands is treated in a separate article. The chief town and port of Jersey is St. Helier, and of Guernsey St Peter Port; a small town on Alderney is called St. Anne. Regular communication by steamer with Guernsey and Jersey is provided on alternate days from Southampton and Weymouth, by steamers of the London & South-Western and Great Western railway companies of England. Railway communications within the islands are confined to Jersey. Regular steamship communications are kept up from certain French ports, and locally between the larger islands. In summer the islands, especially Jersey, Guernsey and Sark, are visited by numerous tourists, both from England and from France.

The islands fall physically into four divisions. The northernmost, lying due west of Cape La Hague, and separated therefrom by the narrow Race of Alderney, includes that island, Burhou and Orliac, and numerous other islets between St. Peter's Port and the headlands of the island of Jersey, formed by a group of jagged rocks, on the largest of which is a powerful lighthouse. Doubtful tradition places here the wreck of the "White Ship," in which William, son of Henry I., perished in 1120; in 1744 the "Victory," a British man-of-war, struck on one of the rocks, and among calamities of modern times the wreck of the "Stella," a passenger vessel, in 1890, may be recalled.

The second division of islands is also the most westerly; it includes Guernsey with a few islets to the west, and to the east, Sark, Herm, Jethou (inhabited islands) and others. The strait between Guernsey and Herm is called Little Russell, and that between Herm and Sark Great Russell. Sark is famous for its splendid cliffs and caves, while Herm possesses the remarkable phenomenon of a shell-beach, or shore, half-a-mile in length, formed wholly of small shells, which accumulate in a tidal eddy formed at the north of the island. To the south-east of these, across the channel called La Déroute, lies Jersey, forming, with a few attendant islets, of which the Ecrehou to the north-east are the chief, the third and fourth southernmost division falls into two main subdivisions. The Minquiers, the more western, are a collection of abrupt rocks, the largest of which, Maitrise Lé, affords a landing and shelter for fishermen. Then eastern subdivision, the Iles Chausey, lies about 9 m. west of the island of Granville (to which commune they belong) on the French coast, and belongs to France. These rocks are close set, low and curiously regular in form. On Grande Ile, the only permanently inhabited island (pop. 100), some farming is carried on, and several of the islets are temporarily inhabited by fishermen. There is also a small granite-quarrying, and seaweed-burning employs many.

None of the islands is mountainous, and the fine scenery for which they are famous is almost wholly coastal. In this respect each main island has certain distinctive characteristics. Bold cliffs are found on the south of Alderney; in Guernsey they alternate with lovely bays; Sark is specially noted for its magnificent sea-cliffs; while the coast scenery of Jersey is on the whole the most gentle than the rest.

Geology.—Geologically, the Channel Islands are closely related to the neighbouring mainland of Normandy. With a few exceptions, to be noted later, all the rocks are of pre-Cambrian, perhaps part of Archean age. They consist of massive granites, gneisses, diorites, porphyrites, and hornblende-schists, which are in turn overlain by dykes and veins. In Jersey we find in the north-west corner a granitic tract extending from Grosnez to St Mary and John, beyond which it passes into a small granitic patch. South of the granitic the island is occupied by St Aubin's Bay; to the eastward belonging to St Aubin's Bay. Granitic masses again appear south of St Brelade's Bay. The eastern half of the island is largely occupied by phrygites and similar rocks (hornstone phrygites) with rhyolites and devitrified obsidians; some of the latter contain large spherulites with a diameter of as much as 24 in.; these are well exposed in Bouley Bay; a complex igneous and intrusive series of rocks lies around St Helier. In the north-east corner of the island a conglomerate, possibly of Cambrian age, occurs between Bouley Bay and St Catherine's Bay. Tracts of blown-sand cover the ground for some distance north of St Clement's Bay and again east of St Ouen's Bay. In the sea off the latter bay a submerged forest occurs. On the coast of Jersey already mentioned, there are similar occurrences near St Peter Port and St Sampson's harbour, and in Vazon Bay in Guernsey. Raised beaches are to be seen at several points in the islands.

Climate.—The climate is mild and very pleasant. In Jersey the mean temperature for twenty years is found to be—In January (the coldest month) 42.1°F, in August (the hottest) 69°F, mean annual 51.7°F. In Guernsey the figures are, for January 42.5°F, July 64.8°F, and July 54.2°F. The mean annual rainfall for twenty-five years in Jersey was 54.21 in., and in Guernsey 48.64 in. The average amount of sunshine in Jersey is considerably greater than in the most favoured spots on the south coast of England; and in Guernsey it is only a little less than in Jersey. Snow and frost are rare, and the seasons of spring and autumn are protracted. Thick sea-fogs are not uncommon, especially in May and June.

Flora and Fauna.—The flora of the islands is remarkably rich, considering their extent, nearly 2000 different species of plants having been counted throughout the group. Of timber proper speaking there is little, but the evergreen oak, the elm and the beech are abundant. Wheat is the principal grain in cultivation; but far more ground is taken up with turnips and potatoes, mangold, parsnip and carrot. The tomato ripens as in France, and the Chinese yam has been successfully grown. There is a curious cabbage, chiefly cultivated in Jersey, which shoots up into a long wooden stalk from 10 to 15 ft. in height, fit for walking-sticks or palisades. Grapes and peaches come to perfection in greenhouses without artificial heat; and among apples and pears but oranges and figs can be reared in the open air. The arbutus ripens its fruit, and the camellia clothes itself with blossom, as in more southern climates; the fuchsia reaches a height of 15 or 20 ft., and the magnolia attains the dimensions of a tree. Of the flowers, both indigenous and exotic, that abound throughout the islands, it is sufficient to mention the Guernsey lily with its rich red petals, which is supposed to have been brought from Japan.

The number of the species of the mammalia is little over twenty, and several of these have been introduced by man. There is a special breed of horned cattle, and each island has its own variety, which is carefully kept from all intermixture. The animals are small and delicate, and marked by a peculiar yellow colour round the eyes and within the ears. The red deer was once indigenous, and the black rat is still common in Alderney, Sark and Herm. The list of birds includes nearly 200 species, nearly 100 are breeding. Among the commonest are the sea-gulls, swallows, and starlings; there are few localities in the northern seas which are visited by a greater variety of fish, and the coasts abound in crustacea, shell-fish and zoophytes.

Government.—For the purposes of government the Channel Islands are divided into two divisions:—(1) Jersey, and (2) the bailiwick of Guernsey, which includes Alderney, Sark, Herm and Jethou with the island of Guernsey. The constitutions of each division are peculiar and broadly similar, but differing in certain important details; they may therefore be considered together for the sake of comparison. Until 1854 governors were appointed by the crown; now a separate military lieutenant-governor is appointed for each division on the recommendation of the war office after consultation with the home office. The other crown officials are the...
bailiff (bailli) or chief magistrate, the *procureur du roi*, representing the attorney-general, and the *avocat du roi*, or in Guernsey the *contrôleur*, representing the solicitor-general. In Jersey the *vicomte* is also appointed by the crown, in the position of a high sheriff (and coroner); but his counterpart in Guernsey, the *prévôt*, is not so appointed. The bailiff in each island is president of the royal court, which is composed of twelve jurats, elected for life, in Jersey by the ratepayers of each parish, in Guernsey by the Elective States, a body which also elects the *prévôt*, who, with the jurats, serves upon it. The rest of the body is made up of the rector of the parishes, the *douzaines*, or elected parish councils ("dozens," from the original number of their members) of the town parish of St Peter Port, the four cantons, and the county parishes, and certain other officials. The royal court administers justice (but in Jersey there is a trial by jury for criminal cases), and in Guernsey can pass temporary ordinances subject to no higher body. It also puts forward *projets de loi* for the approval of the Deliberative States. Alderney and Sark have a separate legal existence with courts dependent on the royal court of Guernsey. In both Jersey and Guernsey the chief administrative body is the Deliberative States. The Jersey States is for the by-election of the lieutenant-governor (who has a veto on the deliberation of any question, but no vote), the bailiff, jurats, parish rectors, parish constables and deputies, the *procureur* and *avocat*, with right to speak but no vote, and the *vicomte*, with right of attendance only. Besides the veto of the lieutenant-governor, the bailiff has the power to dissent from any measure, in which case it is referred to the privy council. In Guernsey the States consists of the bailiff, jurats, eight out of ten rectors, the *procureur* and deputies; while the lieutenant-governor is always invited and may speak if he attends. By both States local administration is carried on (largely through committees); and relations with the British parliament are maintained through the privy council. Acts of parliament are transmitted to the islands by an order in council to be registered in the rolls of the royal court, and are not considered to be binding until this is done; moreover, registration may be held over pending discussion by the States if any act is considered to menace the privileges of the islands. The right of the crown to legislate by order in council is held to be similarly limited. In cases of encroachment on property, a remarkable form of appeal of very ancient origin, called *Clameur de Hano* survives (see HAN, CLAMEUR DE). The islands are in the diocese of Winchester, and there is a dean in both Jersey and Guernsey, who is also rector of a parish.

These peculiar constitutions are of local development, the history of which is obscure. The bailiff was originally assisted in his judicial work by itinerant justices; their place was later taken by the elected jurats; later still the practice of summoning the States to assist in the passing of ordinances was established by the bailiff and jurats, and at last the States claimed the absolute right of being consulted. This was confirmed to them in 1771.

It is characteristic of these islands that there should be compulsory service in the militia. In Jersey and Alderney every man between the ages of sixteen and forty-five is liable, but in Jersey after ten years' service militiamen are transferred to the reserve. In Guernsey the age limit is from sixteen to thirty-three, and the obligation is extended to all who are British subjects, and draw income from a profession practised in the island. Garrisons of regular troops are maintained in all three islands. Taxation is light in the islands, and pauperism is practically unknown.

In 1904 the revenue of Jersey was £70,191, and its expenditure £60,658; the revenue of Guernsey was £79,334, and the expenditure £43,385. The public debt in the respective islands was £322,070 and £195,794. In Jersey the annual revenues from crown rights (park, forests, chantries, lands and revenues from some uncrown lands) and from crown is £700, and about £360 is remitted to the paymaster-general. In Guernsey these revenues, in which the principal item is fines on transference of property (*tretéztimes* or fees), amount to about £450, and about £300 is remitted. In Alderney the revenues (chiefly from harbour duties) amount to about £1,400.

In Jersey the English gold and silver coinage are current, but there is a local copper coinage and local one-pound notes are issued.

Guernsey has also such notes, and its copper coinage consists of pence, halfpence, two-halfpence and one-halfpence (one-eighth of a penny) pieces. A Guernsey pound is taken as equal to 24 francs, and English and French currency pass equally throughout the islands.

Industry.—The old Norman system of land tenure has survived, and the land is parcelled out among a great number of small proprietors; holdings ranging from 5 to 25 acres as a rule. The results of this arrangement seem to be favourable in the extreme. Every corner of the ground is carefully and intelligently cultivated, and a considerable proportion is allotted to market-gardening. The cottages are neat and comfortable, the hedges well-trimmed, and the roads kept in excellent repair. There is a considerable export trade in agricultural produce and stock, including vegetables and fruit, in fish (the fisheries forming an important industry) and in stone. There is no manufacture of importance. The inhabitants share in common the right of collecting and burning seaweed (called *vrai*) for manure. The cutting of the weed (vraicking) became a ceremonial occasion, taking place at times fixed by the government, and connected with popular festivities.

Language.—The language spoken in ordinary life by the inhabitants of the islands is in great measure the same as the old Norman French. The use of the *patois* has decreased naturally in modern times. Modern French is the official language, used in the courts and states, and English is taught in the parochial schools, and is familiar practically to all. The several islands have each its own dialect, differing from that of the others in vocabulary and idiom; differences are also observable in different localities within the same island, as between the north and the south of Guernsey. None of the dialects has received much literary cultivation, though Jersey is proud of being the birthplace of one of the principal Norman poets, Wace, who flourished in the 12th century.

History.—The original ethnology and pre-Christian history of the Channel Islands are largely matters of conjecture and debate. Of early inhabitants abundant proof is afforded by the numerous megalithic monuments—cromlechs, kistvaens and menhirs—still extant. But little trace has been left of Roman occupation, and such remains as have been discovered are mainly of the portable description that affords little proof of actual settlement. There have been inscriptions, a few coins and what are termed a few unimportant garrisons here. The constant recurrence of the name of some of the place-names of the islands, and the fact that pre-Christian names do not occur, leads to the inference that before Christianity was introduced the population was very scanty. It may be considered to have consisted originally of Bretons (Celts), and to have received successively a slight admixture of Romans and Legionaries, Saxons and perhaps Jutes and Vandals. Christianity may have been introduced in the 5th century. Guernsey is said to have been visited in the 6th century by St Sampson of Dol (whose name is given to a small town and harbour in the island), St Marcou or Marculus and St Magloire, a friend and fellow-evangelist of St Sampson, who founded monasteries at Sark and at Jersey, and died in Jersey in 575. Another evangelist of this period was St Heliers, whose name is borne by the chief town of Jersey, St Helier. In his life it is stated that the population of the island when he reached it was only 30. In 933 the islands were made over to William, duke of Normandy (d. 943), and in 1014 the Norman conquest of England their allegiance shifted between the English crown and the Norman conqueror according to the vicissitudes of war and policy. During the purely Norman period they had been enriched with numerous ecclesiastical buildings, some of which are still extant, as the chapel of Kozel in Jersey.

In the reign of John of England the future of the islands was decided by their attachment to the English crown, in spite of the separation of the duchy of Normandy. To John it has been usual to ascribe a document, at one time regarded by the islanders as their Magna Carta; but modern criticism leaves little doubt that it is not genuine. An unauthentic copy of uncertain origin alone has been discovered, and there is little proof of Edward I. was
full of disturbance; and in 1279 Jersey and Guernsey received from the king, by letters patent, a public seal as a remedy for the dangers and losses which they had incurred by lack of such a certificate. Edward II. found it necessary to instruct his collectors not to treat the islanders as foreigners: his successor, Edward III., fully confirmed their privileges, immunities and customs in 1341; and his charter was recognized by Richard II. in 1378. In 1343 there was a descent of the French on Guernsey; the governor was defeated, and Castle Cornet besieged. In 1372 there was another attack on Guernsey, and in 1374 and 1404 the French descended on Jersey. None of these attempts, however, resulted in permanent settlement. Henry V. confiscated the alien priories which had kept up the same connexion with Normandy as before the conquest, and conferred them along with the regalities of the islands on his brother, the duke of Bedford. During the Wars of the Roses, Queen Margaret, the consort of Henry VI., made an agreement with Pierre de Brézé, comte de Maulevrier, the seneschal of Normandy, that if he afforded assistance to the king he should hold the islands independently of the crown. A force was accordingly sent to take possession of Mont Orgueil. It was captured and a small part of the island subjugated, and here Maulevrier remained as governor from 1460 to 1465; but the rest held out under Sir Philip de Carteret, governor of Guernsey, whose island was attached to the see of Winchester. In 1467 Sir Richard Harlston, recaptured the castle and brought the foreign occupation to an end. In 1482-1483 Pope Sixtus IV., at the instance of King Edward IV., issued a bull of anathema against all who molested the islands; it was formally registered in Brittany in 1484, and in France in 1486; and in this way the islands acquired the right of neutrality, which they retained till 1689. In the same reign (Edward IV.) Sark was taken by the French, and only recovered in the reign of Mary, by the strategy (according to tradition) of landing from a vessel a coffin nominally containing a body for burial, but in reality filled with arms. By a charter of 1494, the duties of the governors of Jersey were defined and their power restricted; and the educational interests of the island were furthered at the same time by the foundation of two grammar schools. The religious establishments in the islands were dissolved, as in England, in the reign of Henry VIII. The Reformation was heartily welcomed in the islands. The English liturgy was translated into French for their use. In the reign of Mary there was much religious persecution; and in that of Elizabeth Roman Catholics were maltreated in their turn. In 1588 the islands were attached to the see of Winchester and finally separated from that of Coutances, with which they had long been connected, with short intervals in the reign of John, when they had belonged to the see of Exeter, and that of Henry VI., when they had belonged to Salisbury.

The Presbyterian form of church government was adopted under the influence of refugees from the persecution of Protestantism on the continent. It was formally sanctioned in St Helier and St Peter Port by Queen Elizabeth; and in 1603 King James enacted that the whole of the islands "should quietly enjoy their said liberty." During his reign, however, disputes arose. An Episcopal party had been formed in Jersey, and in 1619 David Bandinel was declared dean of the island. A body of canons which he drew up agreed to the discipline of the Church of England was accepted after considerable modification by the people of his charge; but the inhabitants of Guernsey maintained their Presbyterian practices. Of the hold which this form of Protestantism had got on the minds of the people even in Jersey abundant proof is afforded by the general character of the worship at that time. In the great struggle between king and parliament, Presbyterian Guernsey supported the parliament; in Jersey, however, there were at first parliamentarian and royalist factions. Sir Philip de Carteret, lieutenant-governor, declared for the king, but Dean Bandinel and Michael Leprière, a leader of the people, headed the parliamentary party. They received a commission for the apprehension of Carteret, who established himself in Elizabeth Castle; but after some fighting had taken place he died in the castle in August 1645. Meanwhile in Guernsey Sir Peter Osborne, the governor, was defying the whole island and maintaining himself in Castle Cornet. A parliamentarian governor, Leonard Lydcoat, arrived in Jersey immediately after Sir Philip de Carteret's death. But the daughter Lady Carteret was holding Mont Orgueil; George Carteret, Sir Philip's nephew, arrived from St Malo to support the royalist cause, and Lydcoat and Leprière presently fled to England. George Carteret established himself as lieutenant-governor and bailiff. Bandinel was imprisoned in Mont Orgueil, and killed himself in trying to escape. Jersey was now completely royalist. In 1646 the prince of Wales, afterwards Charles II., arrived secretly at Jersey, and remained over two months at Elizabeth Castle. He went on to France, but returned in 1649, having been proclaimed king by George Carteret, and at Elizabeth Castle he signed the declaration of his claims to the throne on the 29th of October. In 1651, when Charles had fled to France again after the battle of Worcester, parliamentarian vessels of war appeared at Jersey. The islanders, weary of the tyrannical methods of their governor, now Sir George Carteret, offered little resistance. On the 15th of December the royalist remnant yielded up Elizabeth Castle; and at the same time Castle Cornet, Guernsey, which had been steadily held by Osborne, capitulated. In each case honourable terms of surrender were granted. Both islands had suffered greatly from the wholesale confiscation of the French, and when the islanders submitted to Cromwell on the ground of their support of his cause, complained that two-thirds of the land was out of cultivation, and that they had lost "their ships, their traffic and their trading." After the Restoration there was considerable improvement, and in the reign of James II. the islanders got a grant of wool for the manufacture of stockings—4000 tods of wool being annually allowed to Jersey, 2000 to Guernsey, 400 to Alderney and 200 to Sark. Alderney, which had been parliamentarian, was granted after the Restoration to the Carteret family; and it continued to be governed independently till 1825.

By William of Orange the neutrality of the islands was abolished in 1689, and during the war between England and France (1778-1783) there were two unsuccessful attacks on Jersey, in 1779 and 1781, the second, under Baron de Rullecourt, being famous for the victory over the invaders due to the bravery of the young Major Peirson, who fell when the French were on the point of surrender. During the revolutionary period in France the islands were the home of many refugees. In the 18th century various attempts were made to introduce the English customs system; but proved practically a failure, and the islands threw off smuggling and privatizing down to 1800.

CHANNING, WILLIAM ELLERY (1750-1842), American divine and philanthropist, was born in Newport, Rhode Island, on the 7th of April 1750. His maternal grandfather was William Ellery, a signor of the Declaration of Independence; his mother, Lucy Ellery, was a remarkable woman; and his father, William Channing, was a prominent lawyer in Newport. Channing had as a child a refined delicacy of feature and temperament, and seemed to have inherited from his father simple and elegant tastes, sweetness of temper, and warmth of affection, and from his mother that strong moral discernment and straightforward rectitude of purpose and action which formed so striking a feature.  

1 A tod generally equalled 28 lb.
CHANNING

of his character. From his earliest years he delighted in the beauty of the scenery of Newport, and always highly estimated its influence upon his spiritual character. His father was a strict Calvinist, and Dr Samuel Hopkins, one of the leaders of the old school Calvinists, was a frequent guest in his father's house. He was, even as a child, he himself says, "quite a theologian, and would chop logic with his elders according to the fashion of that controversial time." He prepared for college in New London under the care of his uncle, the Rev. Henry Channing, and in 1794, about a year after the death of his father, entered Harvard College. Before leaving New London he came under religious influences to which he traced the beginning of his spiritual life. In his college vacations he taught at Lancaster, Massachusetts, and in term time he stunted himself in food that he might need less exercise and so save time for study,—an experiment which undermined his health, producing acute dyspepsia. From his college course he thought that he got little good, and said "when I was in college, only three books that I read were of any moment to me: ... Ferguson on Civil Society, ... Hutcheson's Moral Philosophy, and Price's Dissertations. Price saved me from Locke's philosophy.

In 1798, he lived at Richmond, Virginia, as tutor in the family of David Meade Randolph, United States marshal for Virginia. Here he renewed his ascetic habits and spent much time in theological study, his mind being greatly disturbed in regard to Trinitarian teachings in general and especially prayer to Jesus. He returned to Newport in 1800 "a thin and pallid invalid," spent a year and a half there, and in 1802 went to Cambridge as regent (or general proctor) in Harvard; in the autumn of 1802 he began to preach, having been approved by the Cambridge Association. On the 1st of June 1803, having refused the more advantageous pastorate of Brattle Street church, he was ordained pastor of the Federal Street Congregational church in Boston. At this time it seems certain that his theological views were not fixed, and in 1808, when he preached a sermon at the ordination of the Rev. John Codman (1782-1847), he still applied the title "Divine Master" to Jesus Christ, and used such expressions as "shed for souls" of the blood of Jesus, and the "Son of God himself left the abodes of glory and expiated a victim of the cross." But his sermon preached on the 4th of July at Baltimore, in which he referred to the abode of John Jared Sparks was in effect a powerful attack on Trinitarianism, and was followed in 1819 by an article in The Christian Disciple, "Objections to Unitarian Christianity Considered," and in 1820 by another, "The Moral Argument against Calvinism"—an excellent evidence of the moral (rather than the intellectual) character of Unitarian protest. In 1814 he had married a rich cousin, Ruth Gibbs, but refused to make use of the income from her property on the ground that clergymen were so commonly accused of marrying for money.

He was now entering on his public career. Even in 1810, in a Fast Day sermon, he warned his congregation of Bonaparte's ambition; two years later he deplored "this country taking part with the oppressor against that nation which has alone arrested his proud career of victory"; in 1814 he preached a thanksgiving sermon for the overthrow of Napoleon; and in 1816 he preached a sermon on war which led to the organization of the Massachusetts Peace Society. His sermon on "Religion, a Social Principle," helped to procure the omission from the federal constitution of the third article of Part I., which made compulsory a tax for the support of religious worship. In 1822 he delivered the Dudley lecture on the "Evidences of Revealed Religion" at Harvard, of whose corporation he had been a member since 1813; he had received its degree of S.T.D. in 1820. In August 1821 he undertook a journey to Europe, in the course of which he met in England many distinguished men of letters, especially Wordsworth and Coleridge. Both of these poets greatly influenced him personally and by their writings, and he prophesied that the Lake poets would be one of the greatest forces in coming spiritual reform. Coleridge wrote of him, "He has the love of wisdom and the wisdom of love."

On his return to America in August 1823, Dr Channing resumed his duties as pastor, but with a more decided attention than before to literature and public affairs, especially after receiving as colleague, in 1824, the Rev. Ezra Stiles Gannett. In 1830, because of his wife's bad health, Channing went to the West Indies. Negro slavery, as he saw it there, and as he had seen it in Richmond, more than thirty years before, so strongly impressed him that he began to write his book Slavery (1835). In this he insists that "what is not profitable, but what is right" is "the first question to be proposed by a rational being"; that slavery ought to be discussed "with a deep feeling of responsibility, and so done as not to put in jeopardy the peace of the slave-holding states"; that "man cannot be justly held and used as property"; that the tendency of slavery is morally, intellectually, and domestically, bad; that emancipation, however, should not be forced on slave-holders by governmental interference, but by an enlightened public conscience in the South (and in the North), if for no other reason, because "slavery should be succeeded by a friendly relation between master and slave; and to produce this the latter must see in the former his benefactor and deliverer." He declined to identify himself with the Abolitionists, whose motto was "Immediate Emancipation" and whose passionate agitation he thought unsuited to the work they were attempting. The moderation and temperance of his presentation of the anti-slavery cause naturally resulted in much misunderstanding and misstatement of his position, such as is to be found in Mrs Chapman's Appendix to the Autobiography of Harriet Martineau, where Channing is represented as actually using his influence on behalf of slavery. In 1837 he published Thoughts on the Evils of a Spirit of Conquest, and on Slavery: A Letter on the Annexation of Texas to the United States, addressed to Henry Clay, and arguing that the Texan revolt from Mexican rule was largely the work of land-speculators, and of those who resolved "to throw Texas open to slave-holders and slaves"; that the results of annexation must be war with Mexico, embroiling the United States with England and other European powers, and at home the extension and perpetuation of slavery, not alone in Texas but in other territories which the United States, once started at conquest, would force into the Union. But he still objected to political agitation by the Abolitionists, preferring "unremitting appeals to the reason and conscience," and, even after the California gold rush took its agitators to California, he called to protest against the murder of Elijah P. Lovejoy, he wrote to The Liberator, counselling the Abolitionists to "dissolve this resort to force by Mr Lovejoy." Channing's pamphlet Emancipation (1840) dealt with the success of emancipation in the West Indies, as related in Joseph John Gurney's Familiar Letters to Henry Clay of Kentucky, describing a Winter in the West Indies (1840), and added his own advice "that we should each of us bear our conscientious testimony against slavery," and that the Free States "abstain as rigidly from the use of political power against Slavery in the States where it is established, as from exercising it against Slavery in foreign communities," and should free themselves "from any obligation to use the powers of the national or state governments in any manner whatever for the support of slavery." In 1842 he published The Duty of the Free States, or Remarks Suggested by the Case of the Creole, a careful analysis of the letter of complaint from the American to the British government, and a defence of the position taken by the British government. On the 1st of August 1842 he delivered at Lenox, Massachusetts, an address celebrating the anniversary of emancipation in the British West Indies. Two months later, on the 2nd of October 1842, he died at Bennington, Vermont.

Physically Channing was short and slight; his eyes were unnaturally large; his voice wonderfully clear, and like his face, filled with devotional spirit. He was not a great pastor, and lacked social tact, so that there were not many people who became his near friends; but by the few who knew him well, he was almost worshipped. As a preacher Channing was often criticised for his failure to deal with the practical everyday duties of life. But his sermons are remarkable for their rare simplicity and gracefulness of style as well as for the thought
CHANSONS DE GESTE

845

That they express. The first open defence of Unitarians was not based on doctrinal differences but on the peculiar nature of the attack on them made in June 1815 by the conservatives in the columns of The Pulpitist, where it was stated that Unitarians were "operating only in secret, . . . guilty of hypocritical concealment of their sentiments." His chief objection to the doctrine of the Trinity (as stated in his sermon at the ordination of the Rev. Jared Sparks) was that it was no longer used philosophically, as showing God's relation to the triple nature of man, but that it had lapsed into mere Tritheism. To the name "Unitarian" Channing objected strongly, thinking "unity" as abstract a word as "trinity" and as little expressing the close fatherly relation of God to man. It is to be noted that he strongly objected to the growth of "Unitarian orthodoxy" and its increasing narrowness. His views as to the divinity of Jesus were based on phrases in the Gospels which to his mind established Christ's admission of inferiority to God the Father,—for example, "Knoweth no man, neither the Son, but the Father"; at the same time he regarded Christ as "the sinless and spotless son of God, distinguished from all men by that infinite peculiarity—freedom from moral evil." He believed in the pre-existence of Jesus, and that it differed from the pre-existence of other souls in that Jesus was actually conscious of such pre-existence, and he reckoned him one with God the Father in the sense of spiritual union (and not metaphysical mystery) in the same way that Jesus bade his disciples "be ye one, even as I am one." Bunsen called him "the prophet in the United States for the presence of God in mankind." Channing believed in historic Christianity and in the story of the resurrection, "a fact which comes to me with a certainty I find in few ancient histories." He also believed in the miracles of the Gospels, but held that the Scriptures were not inspired, but merely records of inspiration, and so saw the possibility of error in the construction put upon miracles by the ignorant disciples. But in only a few instances did he refuse full credence of the plain gospel narrative of miracles. He held, however, that the miracles were facts and not "evidences" of Christianity, and he considered that belief in them followed and did not lead up to belief in Christianity. His character was absolutely averse from controversy of any sort, and in controversies into which he was forced he was free from any theological odium and continually displayed the greatest breadth and catholicity of view. The differences in New England churches he considered largely verbal, and he said that "would Trinitarians tell us what they mean, their system would generally be found little else than a mystical form of the Unitarian doctrine."

His opposition to Calvinism was so great that even in 1812 he declared "existence a curse" if Calvinism be true. Possibly his boldest and most elaborate defence of Unitarianism was his sermon on Unitarianism most favourable to Pity, preached in 1826, criticizing as it did the doctrine of atonement by the sacrifice of an "infinite substitute"; and the Election Sermon of 1830 was his greatest plea for spiritual and intellectual freedom.

Channing's reputation as an author was probably based largely on his publication in The Christian Examiner of Remarks on the Character and Writings of John Milton (1826), Remarks on the Life and Character of Napoleon Bonaparte (1827-1828), and an Essay on the Character and Writings of Pèlènon (1829). An Essay on Self-Culture (1838) was an address introducing the Franklin Lectures delivered in Boston September 1838. Channing was an intimate friend of Horace Mann, and his views on the education of children are stated, by no less an authority than Elizabeth Palmer Peabody, to have anticipated those of Froebel. His Complete Works have appeared in various editions (5 vols., Boston, 1841; 2 vols., London, 1865; 1 vol., New York, 1875).

Among members of his family may be mentioned his two nephews Henry Whipple (1817-1884), son of his brother Francis Dana, and William Ellery, commonly known as Ellery (1818-1901), son of his brother Walter, a Boston physician (1786-1876). The former, whose daughter married Sir Edwin Arnold, the English poet, became a Unitarian pastor, for some time in America, and also in England, where he died; he was deeply interested in Christian Socialism and was a constant writer, translating Jouffroy's Ethics (1849), and writing the Memoirs of Margaret Fuller (1852); and he wrote the biography of his uncle (see O. B. Frothingham's Memoir, 1886). Ellery Channing married Margaret Fuller's sister (1842), and besides critical essays and poems published an intimate sketch of Thoreau in 1873.

See the Memoir by William Henry Channing (3 vols., London, 1855; republished in one volume, New York, 1880); Elizabeth Palmer Peabody, Remarks on the Character and Writings of William Ellery Channing, D.D. (Boston, 1880), intimate but inept; John White Chalcroft, William Ellery Channing, Minister of Religion (Boston, 1903); and William M. Salter, "Channing as a Social Reformer" (Unitarian Review, March 1888).

(K. R. W.)
of Charlemagne with his rebellious vassals. This is what has been defined as the Feudal Epic; it includes Girars de Vione and Ogier the Dane, both of the 13th century, or the end of the 12th. A third group follows Charlemagne and his peers to the East. It is in the principal of these poems, The Pilgrimage to Jerusalem, that Alexandrine verse first makes its appearance in French literature. This must belong to the beginning of the 12th century. A fourth group, antecedent to the Spanish war, is of the end of the 12th century and the beginning of the 13th; it includes Aiquin, Fierabras and Otinel. The fifth class discusses the war in Spain, and it is to this that Roland belongs; there are different minor epics dealing with the events of Roncevaux, and independent chansons of Guillaume de Boron, Gaidon and Anses de Carths. The Geste du Roi comprises a sixth and last group, proceeding with events up to the death of Charlemagne; this contains Hous de Bordeaux and a vast number of poems of minor originality and importance.

Another cycle is that of Duke William Shortnose, La Geste de Guillaume. This includes the very early and interesting Departure of the Almer Chidren, Aliscans and Rainoar. It is thought that this cycle, which used to be called the Geste de Garin de Monglane, is less artificial than the others; it deals with the heroes of the South who remained faithful in their vassalage to the throne. The poems belonging to this cycle are extremely numerous, and some of them are among the earliest which survive. These chansons find their direct opposites in those which form the great cycle of La Geste de Doon de Mayence, sometimes called la fausse geste," because it deals with the feats of the traitors, of the rebellious family of Ganelon. This is the geste of the Northmen, always hostile to the Carolingian dynasty. It comprises some of the most famous of the chansons, in particular Parise la duchesse and The Four Sons of Aymon. Several of its sections are the production of a known poet, Raimbart of Paris. From this triple division of the main body of the chansons de geste into La Geste du Roi, La Geste de Guillaume and La Geste de Doon, are excluded certain poems of minor importance,—some provincial, such as Amis and Amiles and Garin, some dealing with the Crusades, such as Antioche, and some which are not connected with an existing cycle, such as Cipresi de Vignescaux; most of this last category, however, are works of the decadence.

The analysis which is here sketched is founded on the latest theories of Leon Gautier, who has given the labour of a lifetime to the investigation of this subject. The wealth of material is baffling to the ordinary student; of the medieval chansons de geste many hundreds of thousands of lines have been preserved. The habit of composing became in the 14th century, as has been said, no longer an art but a monomania. Needless to add that a very large proportion of the surviving poems have never yet been published. All the best of the early chansons de geste are written in ten-syllable verse, divided into stanzas or laisses of different length, united by a single assonance. Rhyme came in with the 13th century, and had the effect in languid bards of weakening the narrative; the sing-song of it led at last to the abandonment of the love of a favour of plain historic prose. The greatest character of the chansons de geste, especially of those of the 12th century, is hard, coarse, inflexible, like the march of rough men stiffened by coats of mail. There is no art and little grace, but a magnificent display of force. These poems enshrine the self-sufficiency of a young and powerful people; they are full of Gallic pride, they breathe the spirit of an indomitable warlike energy. All their figures belong to the same social order of things, and all illustrate the same fighting aristocracy. The moving principle is that of chivalry, and what is presented is, invariably, the spectacle of the processional life of a medieval soldier. The age described is a disturbed one; the feudal anarchy of Europe is united, for a moment, in defending western civilization against the inroads of Asia, against "the yellow peril." But it is a time of transition in Europe also, and Charlemagne, the immortal but enfeebled emperor, whose beard is whiter than lilies, represents an old order of things against which the rude barons of the North are perpetually in successful revolt. The loud cry of the dying Ronald, as E. Quinet said, rings through the whole poetical literature of medieval France; it is the voice of the individuality of the great vassal, who, in the decay of the empire, stands alone with himself and with his sword.

CHANT (derived through the Fr. from the Lat. cantare, to sing; an old form is "chant"), a song or melody, particularly one sung according to the rules of church service-books. For an account of the chant or cantus firmus of the Roman Church see PLAIN-SONG. In the English church "chants" are the tunes set to the unmetrical verses of the psalms and canticles. The chant consisted of an "intonation" followed by a reciting note of indefinite length; a "mediation" closed the first part of the verse, leading to a second reciting note; a "termination" closed the second part of the verse. In the English chant the "intonation" disappeared. Chants are "single," if written for one verse only, "double," if for two. "Quadruple" chants for four verses have also been written.

CHANTABUN, or Chantaburi, the principal town of the Siamese province of the same name, on the E. side of the Gulf of Siam, in 105° 6' E., 12° 38'. Pop. about 5000. The town lies about 12 m. from the sea on a river which is navigable for boats and inside the bar of which there is good anchorage for light-draft vessels. The trade is chiefly in rubies and sapphires from the mines of the Krat and Pailin districts, and in pepper, of which about 500 tons are exported annually. Cardamoms and rosewood are also exported. In 1905 Chantabun was made the headquarters of a high commissioner with jurisdiction extending over the coast districts from the Nam Wan on the East to Cape Liant on the West, which were thus united to form a provincial division (Monton). In 1895 Chantabun was occupied by a French force of four hundred men, a step taken by France as a guarantee for the execution by Siam of undertakings entered into the treaty of that year. The occupation, which was merely military and did not affect the civil government, lasted until January 1905, when, in accordance with the provisions of the Franco-Siamese treaty of 1904, the garrison of occupation was withdrawn. Chantabun has been since the 17th century, and still is, a stronghold of the Roman Catholic missionaries, and the Christian element amongst the population is greater here than anywhere else in Siam.

CHANTADA, a town of north-western Spain, in the province of Lugo, on the left bank of the Rio de Chantada, a small right-hand tributary of the river Miño, and on the main road from Orense, 18 m. S. by W., to Lugo, 28 m. N. by E. Pop. (1900) 15,003. Chantada is the chief town of the fertile region between the Miño and the heights of El Faro, which mark the western border of the province. Despite the lack of railway communication, it has a thriving trade in grain, flax, hemp, and dairy produce.

CHANTAGE (a Fr. word from chanter, to sing, slang for a criminal making an avowal under examination), a demand for money backed by the threat of scandalous revelations, the French equivalent of "blackmail."

CHANTARELLE, an edible fungus, known botanically as Cantharellus cibarius, found in woods in summer. It is golden yellow, somewhat invariably conical in shape and about 2 in. broad and high. The cap is flattened above with a central depression and a thick lobed irregular margin. Running down into the stem from the cap are a number of shallow thick gills. The substance of the fungus is dry and opaque with a peculiar smell suggesting ripe apricots or plums. The flesh is whitish tinged with yellow. The chantarelle is sold in the markets on the continent of Europe, where it forms a regular article of food, but seems little known in Britain though often plentiful in the New Forest and elsewhere. Before being cooked they should be allowed to dry, and then thrown into boiling water. They mav
then be stewed in butter or oil, or cut up small and stewed with meat. No fungus requires more careful preparation. See M. C. Cooke, British Edible Fungi, (1891), pp. 104-105.

**CHANTAVOINE—CHANTREY**

847

**CHANTAVOINE, HENRI (1850— ),** French man of letters, was born at Montpellier on the 6th of August 1850, and was educated at the École Normale Supérieure. After teaching in the provinces he moved, in 1876, to the Lycée Charlemagne in Paris, and subsequently became professor of rhetoric at the Lycée Henri IV. and maître de conférences at the École Normale at Sèvres. He was associated with the Nouvelle Revue from its foundation in 1879, and he joined the Journal des débats in 1884. His poems include Poèmes sincères (1877), Satires contemporaines (1881), Ad memoriam (1884), Au fil des jours (1889).

**CHANTILLY,** a town of northern France, in the department of Oise, 25 m. N. of Paris on the Northern railway to St. Quentin. Pop. (1906) 4632. It is finely situated to the north of the forest of Chantilly and on the left bank of the river Nonette, and is one of the favourite Parisian resorts. Its name was long associated with the manufacture, which has now to a great extent decayed, of lace and blonde; it is still more celebrated for its château and its park (laid out originally by A. Le Notre in the second half of the 17th century), and as the scene of the naval races of the French Jockey Club. The château consists of the palace built from 1876 to 1885 and of an older portion adjoining it as the châtelet. The old castle must have been in existence in the 13th century, and in the reign of Charles VI. the lordship belonged to Pierre d’Orgemont, chancellor of France. In 1484 it passed to the house of Montmorency, and in 1632 from that family to the house of Condé. Louis II., prince de Condé, summoned the Great, was specially attached to the place, and did a great deal to enhance its beauty and splendour. Here he enjoyed the society of La Bruyère, Racine, Molière, La Fontaine, Boileau, and other great men of his time; and here his steward Vatel killed himself in despair, because of a hitch in the preparations for the reception of Louis XIV. The stables close to the racecourse were built from 1719 to 1735 by Louis-Henri, duke of Bourbon. Of the two splendid mansions existing at that period known as the grand château and the châtelet, the former was destroyed about the time of the Revolution, but the latter, built for Anne de Montmorency by Jean Bullant, still remains as one of the finest specimens of Renaissance architecture in France. The château d’Enghien, facing the entrance to the grand château, was built in 1770 as a guest-house. On the death in 1830 of the duke of Bourbon, the last representative of the house of Condé, the estate passed into the hands of Henri, duc d’Aumale, fourth son of Louis Philippe. In 1852 the house of Orleans was declared incapable of possessing property in France, and Chantilly was accordingly sold by auction. Purchased by the English bankers, Coutts & Co., it passed back into the hands of the duc d’Aumale in 1872. By him a magnificent palace, including a fine chapel in the Renaissance style, was erected on the foundations of the ancient grand château and in the style of the châtelet. It is quadrilateral in shape, consisting of four unequal sides flanked by towers and built round a courtyard. The whole group of buildings as well as the pleasure-ground behind them, known as the Parc de la Volière, is surrounded by fosses supplied with water from the Nonette. On the terrace in front of the château there is a bronze statue of the constable Anne de Montmorency. The duc d’Aumale installed in the châtelet a valuable library, specially rich in incunabula and 16th century editions of classic authors, and a collection of the paintings of the great masters, besides many other objects of art. By a public act in 1886 he gave the park and château with its superb collections to the Institute of France in trust for the nation, reserving to himself only a life interest; and when he died in 1897 the Institute acquired full possession.

**CHANTREY, SIR FRANCIS LEGATT (1782–1841),** English sculptor, was born on the 7th of April 1782 at Norton near Sheffield, where his father, a carpenter, cultivated a small farm. His father died when he was eight years of age; and his mother having married again, his profession was left to be chosen by his friends. In his sixteenth year he was on the point of being apprenticed to a grocer in Sheffield, when, having seen some wood-carving in a shop-window, he requested to be made a carver instead, and was accordingly placed with a Mr. Ramsey, wood-carver in Sheffield. In this situation he became acquainted with Raphael Smith, a distinguished craftsman in crayon, who gave him lessons in painting; and Chantrey, eager to commence his course as an artist, procured the cancelling of his indentures, and went to try his fortune in Dublin and Edinburgh, and finally (1802) in London. Here he first obtained employment as an assistant wood-carver, but at the same time devoted himself to portrait-painting, bust-sculpture, and modelling in clay. He exhibited pictures at the Academy for some years from 1804, but from 1807 onwards devoted himself mainly to sculpture. The sculptor Nollekens showed particular zeal in recognizing his merits. In 1807 he married his cousin, Miss Wale, who had some property of her own. His first imaginative work in sculpture was the model of the head of Satan, which was exhibited at the Royal Academy in 1808. He afterwards executed for Greenwich hospital four colossal busts of the admirals Duncan, Howe, Vincent and Nelson; and so rapidly did his reputation spread that the next bust which he executed, that of Horne Tooke, was purchased by the Parliament for the House of Commons. During this period he was almost uninterruptedly engaged in professional labour. In 1810 he visited Italy, and became acquainted with the most distinguished sculptors of Florence and Rome. He was chosen an associate (1815) and afterwards a member (1818) of the Royal Academy, received the degree of M.A. from Cambridge, and that of D.C.L. from Oxford, and in 1835 was knighted. He died after an illness of only two hours’ duration on the 25th of November 1841, having for some years suffered from disease of the heart, and was buried in a tomb constructed by himself in the church of his native village.

The works of Chantrey are extremely numerous. The principal are the statues of Washington in the State-house at Boston, U.S.A.; of George III. in the Guildhall, London; of George IV. at Brighton; of Pitt in Hanover Square, London; of James Watt in Westminster Abbey and in Glasgow; of Roscoe and Canning in Liverpool; of Dalton in Manchester; of Lord President Blair and Lord Melville in Edinburgh, &c. Of his equestrian statues the most famous are those of Sir Thomas Munro of Calcutta, and those of the Duke of Wellington and the London Exchange. But the finest of Chantrey’s works are his busts, and his delineations of children. The figures of two children asleep in each other’s arms, which form a monumental design in Lichfield cathedral, have always been lauded for beauty, simplicity and grace. So is also the statue of the girlish Lady Louisa Russell, represented as standing on tiptoe and fondling a dove in her bosom. Both these works appear, in design, to have owed something to Stothard; for Chantrey knew his own scantiness of ideal invention or composition, and on system sought aid from others for such attempts. In busts, his leading excellence is facility—a ready unconstrained air of life, a prompt vivacity of ordinary expression. Allan Cunningham and Weekes were his chief assistants, and were indeed the active executors of many works that pass under Chantrey’s name. Chantrey was a man of warm and genial temperament, and is said to have borne a noticeable though commonplace resemblance to the usual portraits of Shakespeare.

**CHANTREY, Sir Francis Legatt, M.R.A.,**) was elected a Fellow of the Royal Society on the 21st of December 1840. Chantrey (who had no children) left his whole residuary personal estate after the decease or on the second marriage of his widow (less certain specified annuities and bequests) in trust for the president and trustees of the Royal Academy (or in the event of the dissolution of the Royal Academy, to such society as might take its place), the income to be devoted to the encouragement of British fine art in painting and sculpture only, by “the purchase of works of fine art of the highest merit... that can be obtained.” The funds might be allowed to accumulate for not more than five years; works by British or foreign artists, dead or living, might be acquired, so long as such works were entirely executed within the shores of Great Britain, the artists having been in residence there during such execution and completion. The prices to be paid
CHANT ROYAL, one of the fixed forms of verse invented by the ingenuity of the poets of medieval France. It is composed of five strophes, identical in arrangement, of eleven verses each, and of an envoi of five verses. All the verses are written on the five strophes exhibited in the first strophe, the entire poem, therefore, consisting of sixty lines in the course of which five strophes are repeated. It has been conjectured that the chant royal is an extended ballade, or rather a ballade conceived upon a larger scale; but which form preceded the other appears to be uncertain. On this point Henri de Créoë, who wrote about these forms of verse in his Art et science de rhétorique (1493), throws no light. He dwells, however, on the great dignity of what he calls the "Chant Royal," and says that those who defy with success the ardor of its rules deserve crowns and garlands for their pains. Étienne Pasquier (1529-1615) points out the fact that the Chant Royal, by its length and the rigidity of its structure, is better fitted than the ballade for solemn and pompous themes. In Old French, the most admired chants royal are those of Clément Marot; his Chant royal chrétien, with its refrain

"Santé au corps, et Paradis à l'âme,"

was celebrated. Théodore de Bavière defines the chant royal as essentially belonging to ages of faith, when its subjects could be either the exploits of a hero of royal race or the processional splendidours of religion. La Fontaine was the latest of the French poets to attempt the chant royal, until it was resuscitated in modern times.

This species of poem was unknown in English medieval literature and was only introduced into Great Britain in the last quarter of the 19th century. The earliest chant royal in English was that published by Edmund Gosse in 1877; it is here given to exemplify the structure and rhyme-arrangement of the form—

THE PRAISE OF DIONYSUS

"Behold, above the mountains there is light,
A streak of gold, a line of gathering fire,
And the dim East hat its flower bright
With pale aeral flame, that drives up higher
The lurid mists which all the night long were
Breathing the dark ravines and coverts bare;
Behold, behold! the granite gates unclose,
And down the vales a lyric people flow,
Who dance to music, and in dancing fling
Their frantic robes to every wind that blows,
And deathless praises to the Vine-God sing.

Nearer they press, and nearer still in sight,
Still dancing blithely in a solemn choir;
Tossing on high the symbol of their rite,
The cone-tipp'd thyrsus of a god's desire;
Nearer they come, tall damasles flushed and fair,
With ivy circling their abundant hair,
Onward, with even pace, in stately rows,
With eye that flashes, and with cheek that glows,
And all the while their tribute-songs they bring,
And newer glories of the past disclose
And deathless praises to the Vine-God sing.

The pure luxuriance of their limbs is white,
And flashes clearer as they draw the higher,
In blast of dawn and in an air of bliss.
Smooch without wound of thorn, or fleck of mire,
Borne up by song as by a trumpet's glare,
Leading the van to conquest, on they fare,
Fearless and bold, whoever comes or goes.
These shining cohorts of Bacchantes close,
Shouting and shuffling till the mountains ring,
And forests grim forget their ancient woes,
And deathless praises to the Vine-God sing.

And youths there are for whom full many a night
Brought dreams of bliss, vague dreams that haunt and tire
Who rose in their ecstasy alert,
And wandered forth through many a scourgir brier,
And waited shivering in the icy air,
And wrapped the leopard-skin about them there,
Knowing for all the bitter air that froze,
The time must come, that ever poet knows,
When he shall rise and feel himself a king,
And follow, follow where the ivy grows,
And deathless praises to the Vine-God sing.
But oh! within the heart of this great flight,
Whose ivory arms hold up the golden lyre?
What form is this of more than mortal height?
What matchless beauty, what inspired ire?
The Kandy old men know the prize they bear,
And harmonize their steps with tender care;
Bent to the morning, like a living rose,
The immortal splendour of his face he shows;
And, where the gilded leaf and quiver and wing
Tremble with rapture, stirred in their repose,
And deathless praises to the Vine-God sing.

Envoi.
PRINCE of the flute and ivy, all thy foes
Record the bounty that thy grace bestows,
But we, thy servants, to thy glory cling,
And with no frigid lips our songs compose;
And deathless praises to the Vine-God sing.

In the middle ages the chant royal was largely used for the praise of the Virgin Mary. Eustache Deschamps (1340–1410) distinguished these Marian chants royaux, which were called "serviteo," by the absence of an envoi. These poems are that mentioned by Rutebeuf, a trouvère of the 13th century. The chant royal is practically unknown outside French and English literature.

CHANTRY (Fr. chanson, from chant, to sing; Med. Lat. cantuaria), a small chapel built out from a church, endowed in pre-Reformation times for the express purpose of maintaining priests for the chanting of masses for the soul of the founder or of some one named by him. It generally contained the tomb of the founder, and, as the officiant or mass-priest was often unconnected with the parochial clergy, had an entrance from the outside. The word passed through generations of meaning. Its first sense was singing or chanting. Then it meant the endowment funds, next the priests, and then the church or chapel itself.

CHANUTE, a city of Neosho county, Kansas, U.S.A., 1 m. from the Neosho river, and about 120 m. S.W. of Kansas city. Pop. (1860) 3926; (1890) 4208, of whom 210 were foreign-born and 171 were negroes; (1910 census) 9272. Chanute is served by the Atchison, Topeka & Santa Fe and the Missouri, Kansas & Texas railways, the former having large repair shops. The city is in the Kansas-Oklahoma oil and gas field and is surrounded by a fine farming and dairying region, in which special attention is given to the raising of small fruit; oil, gas, cement rock and brick shale are found in the vicinity. Among the city's manufactures are refined oil, Portland cement, vitrified brick and tile, glass, asphalt, ice, cigars, drilling machinery, and flour. The municipality owns and operates the waterworks, a natural gas plant, and an electric lighting plant. Four towns—New Chicago, Tioga, Chicago Junction and Alliance—were here started about the same time (1870). In 1872 they were consolidated, and the present name was adopted in honour of Octave Chanute (b. 1832), the civil engineer and aeronautist (see Flight and Flying), then the engineer of the Lawrence, Leavenworth & Galveston railway (now part of the Atchison system). Chanute was incorporated as a city of the third class in 1873, and its charter was revised in 1888. Natural gas and oil were found here in 1859, and Chanute became one of the leaders of the independent refinery in their contest with the Standard Oil Company.

CHANZY, ANTOINE EUGÈNE ALFRED (1833–1888), French general, was born at Nourat (Ardenne) on the 18th of March 1833. The son of a cavalry officer, he was educated at the naval school at Brest, but enlisted in the artillery, and, subsequently passing through St Cyr, was commissioned in the zouaves in 1854. He saw a good deal of fighting in Algeria, and was promoted in 1848, and captain in 1851. He became chef de bataillon in 1856, and served in the Lombardy campaign of 1859, being present at Magenta and Solferino. He took part in the Syrian campaign of 1860–61 as a lieutenant-colonel; and as colonel commanded the 4th regiment at Rome in 1864. He returned to Algeria as general of brigade, assisted to quell the Arab insurrection, and commanded the subdivisions of Bel Abbes and Tlemcen in 1868. Although he had acquired a good professional reputation, he was in bad odour at the war office on account of suspected contributions to the press, and at the outbreak of the Franco-German War he was curiously refused a brigade command. After the revolution, however, the government of national defence called him from Algeria, and gave him a general of division, and gave him command of the XVII. corps of the army of the Loire. (For the operations of the Orleans campaign which followed, see Franco-German War.) The Loire army won the greatest success of the French during the whole war at Coulmiers, and followed this up with another victorious action at Paty; in both engagements General Chanzy's corps took the most brilliant part. After the second battle of Orleans and the separation of the two wings of the French army, Chanzy was appointed to command that in the west, designated the second army of the Loire. His enemies, the grand duke of Mecklenburg, Prince Frederick Charles, and General von der Tann, all regarded Chanzy as their most formidable opponent. He displayed conspicuous moral courage and constancy, not less than technical skill, in the fighting from Beaugency to the Loire, in his retreat to Le Mans, and in retiring to Laval behind the Mayenne. As Gambetta was the go-to Chanzy was the strong right arm of French resistance to the invader. He was grand officer of the Legion of Honour, and was elected to the National Assembly. At the outbreak of the Commune, Chanzy, then at Paris, fell into the hands of the insurgents, by whom he was forced to give his parole not to serve against them. It was said that he would otherwise have been appointed instead of MacMahon to command the army of Versailles. A ransom of $40,000 was also paid by the government for him. In 1872 he became a member of the committee of defence and commander of the VII. army corps, and in 1875 was appointed governor of Algeria, where he remained for six years. In 1875 he was elected a life senator, in 1878 received the grand cross of the Legion of Honour, and in 1879, without his consent, was nominated for the presidency of the republic, receiving a third of the total votes. For two years he was ambassador at St Petersburg, during which time he received many tokens of respect, not only from the Russians, but also the German emperor, William I., and Prince Bismarck. He died suddenly, while commanding the VI. army corps (stationed nearest to the German frontier), at Chalons-sur-Marne, on the 4th of January 1883, only a few days after Gambetta, and his remains received a state funeral. He was the author of La Deuxième Armée de la Loire (1872). Statues of General Chanzy have been erected at Nourat and Lens.

CHAOS, in the Hesiodic theogony, the infinite empty space, which existed before all things (Theog. 116, 123). It is not, however, a mere abstraction, being filled with clouds and darkness; from it proceed Erebos and Nyx (Night), whose children are Aether (upper air) and Hemera (Day). In the Orphic cosmogony the origin of all goes back to Chronos, the personification of time, who produces Aether and Chaos. In the Aristotelian paradise (Birds, 691a) the winged Eros in conjunction with gloomy Chaos brings forth the race of birds. The later Roman conception (Ovid, Metam. i. 7) makes Chaos the original undigested, amorphous mass, into which the architect of the world introduces order and harmony, and from which individual forms are created. In the created world (cosmos, order of the universe) the world is divided into two worlds of different meanings—the universe; the space between heaven and earth; the under-world, and its ruler. Metaphorically it is used for the immeasurable darkness, eternity, and the infinite generally. In modern usage "chaos" denotes a state of disorder and confusion.

CHAPBOOK (from the O. Eng. chap, to buy and sell), the comparatively modern name applied by booksellers and bibliophiles to the little stitched tracts written for the common people and formerly circulated in England, Scotland and the American colonies by itinerant dealers or chapmen, consisting chiefly of vulgarized versions of popular stories, such as Tom Thumb, Jack the Giant Killer, Mother Shipton, and Reynard the Fox—travels, biographies and religious treatises. Few of the older chapbooks exist. Samuel Pepys collected some of the best and had them bound into small quarto volumes, which he called
Vulgaria; also four volumes of a smaller size, which he lettered
Penni Williamcs, Penny Merriments, Penny Compliments, and
Penny Godlinesses. The early chapbooks were the direct
descendants of the black-letter tracts of Wynken de Worde. It
was in France that the printing-press first began to supply
reading for the common people. At the end of the 15th century
there was a large popular literature of farces, tales in verse
and prose, satires, almanacs, &c., stitched together so as to contain
a few leaves, and circulated by itinerant book-sellers, known as
colporteurs. Most early English chapbooks are adaptations or
translations of these French originals, and were introduced into
England early in the 16th century. The chapbooks of the 15th century
present us with valuable illustrations of the manners of the
time; one of the best known is that containing the story of
Dick Whittington. Others which had a great vogue are Jack
the Giant Killer, Little Red Riding Hood, and Mother Shipton.
Those of the 16th century are far inferior in every way, both as
regards the literature and the printing; and unfortunately it
is these which form the bulk of what is now known to us in
collections as chapbooks. They have never exercised any great
influence in England nor received much attention, owing no
doubt to their poor literary character. In France, on the other
hand, their French equivalents have been the subject of a
systematic study, and a Histoire des livres portiers ou de la
livraison (1854) goes deeply into the subject. Amongst English books may be mentioned Notices of Fugitive Tracts and Chapbooks, by J. O. Halliwell-Phillipps (1849); Chapbooks of the 18th Century, by John Ashton (1882), and some reprints by the Villon Society in 1885. The word "chapbook" has not been noticed earlier than 1824, when Dibdin, the celebrated bibliographer, described a work as being "a chapbook, printed in rather a neat black-letter."

CHAPE (from the Fr. chape, a hood, cope or sheath), a cover
or metal plate, such as the cap upon the needle in the compass,
also the transverse guard of a sword which protects the hand.
From the original meaning comes the use of the word as a support
or catch to attach one thing to another, as a hook on a belt
to which the sword is fastened. The word is also used for the tip
of a fox's brush.

CHAPEL, a place of religious worship,¹ a name properly applied
to that of a Christian religious body, but sometimes to any small
temple of pagan worship (Lat. sanctum). The word is derived
through the O. Fr. chapele, modern chapelle, from the Late Lat.
capella or cappella, diminutive of capa, a cape, part of a woman's
robe. The word was transferred to any sanctuary containing
relics, in the early history of the Frankish Church, because the
cloak of St Martin, cappa brevi, Sancti Martini, one of the most sacred relics of the Frankish kings, was carried
in a sanctuary or shrine wherever the king went; and oaths were
taken on it (see Ducange, Glossarium, s.v. Capella). Such a sanctuary was served by a priest, who was hence called capellanus,
from which is derived the English "chaplain" (q.e.) The strict
application of the word to a sanctuary containing relics was
extended to embrace any place of worship other than a church,
and it was synonymous, therefore, with "oratory" (oratorium),
especially one attached to a palace or to a private dwelling-house.
The celebrated Sainte Chapelle in Paris, attached to what is now
the Palais de Justice, well illustrates the early and proper
meaning of the word. It was built (consecration, 1248) by St Louis
of France to contain the relic of the Crown of Thorns, ransomed
by the king from the Venetians, who held it in pawn from the
Latin emperor of the East, John of Brienne, lately dead. The
chapel served as the sanctuary of the relics, the upper chapel,
and the whole building was attached as the place of
worship of the king's palace. This, the primary meaning,
survives in the chapels usually placed in the aisles of cathedrals
and large churches. They were originally built either to contain
relics of a particular saint to whom they were dedicated,
or the tomb of a particular family.

In the Church of England the word is applied to a private
place of worship, attached either to the palaces of the sovereign,
"chapel royal" or to the residence of a private person, to a
college, school, prison, workhouse, &c. Further, the word has
particular legal applications, though in each case the building
might be and often is styled a church. These are places of
worship supplementary to a parish church, and may be either
"chapels of ease," to ease or relieve the mother-church and serve
those parishioners who may live far away, "parochial chapels,"
the "churches" of ancient divisions of a very large and widely
scattered parish, or "district chapels," those of a district of a
parish divided under the various church building acts. A "free
chapel" is one founded by the king and by his authority, and
visited by him and not by the bishop. A proprietary chapel is
that belongs to a private person. They are anomalies to the
English ecclesiastical law, have no parish rights, and can
be converted to other than religious purposes, but a clergyman
may be licensed to perform duty in such a place of worship.
In the early and middle part of the 19th century such proprietary
chapels were common, but they have practically ceased to exist.
"Chapel" was early and still is in England the general name for
a place of worship, as distinguished from a church. The application of "church" to all places of worship, without
any distinction of sect is becoming more and more common.
The word "chapel" was in this restricted sense first applied to places
of worship belonging to the Roman Church in England, and was
thus restricted to those attached to foreign embassies, or to those
of the consorts of Charles I. and II. and James II., who were
members of that church. The word is still frequently the general
term for Roman Catholic churches in Great Britain and always
so in Ireland. The use of "chapel" as a common term for all
Nonconformist places of worship was general through most of the
19th century, so that "chapel and church" was the usual phrase
to mark the distinction between members of the established
Church and those of Nonconformist bodies. Here the widened
use of "church" noticed above has been especially marked.
Most of the recent buildings for worship erected by Noncon-
formist bodies will be found to be styled Wesleyan, Congrega-
tional, &c., churches. It would appear that while the word
"chapel" was not infrequent in the early history of Noncon-
formity, "meeting-house" was the more usual term.

From the architectural point of view the addition of chapels
to a cathedral or large church assumes some historical importance
and has been the cause of much excitement. It was
the introduction of the apsidal chapels in the churches of France
which eventually led to the chevet or cluster of eastern chapels
in many of the great cathedrals, and also sometimes to the
extension of the transept so as to include additional apsidal
chapels on the east side. In France, and to a certain extent in
Italy, the multiplication of chapels led to their being placed on
the north and south side of the aisles, and in some cases, as at
Albi in France, to the suppression of the aisles and the instalment
of the chapels in their place. The chapels of the colleges at
Oxford and Cambridge are sometimes of large dimensions and
architecturally of great importance, that of Christ Church
being actually the cathedral of Oxford; among others may be mentioned
the chapel of Merton College, and the new chapel of Exeter College,
both in Oxford, and the chapel of King's College, Cambridge, which is roofed over with perhaps the finest fan-vault
in England. (See VAULT, Plate II., fig. 19.)

CHAPELAIN, JEAN (1515-1674), French poet and man of
letters, the son of a notary, was born in Paris on the 4th of
December 1515. His father destined him for his own profession;
but Jean was one of those who had known of his plan, and determined
otherwise. At an early age Chapelain began to qualify himself
for literature, learning, under Nicolas Bourbon, Greek and Latin,
and teaching himself Italian and Spanish. Having finished his
studies, he was engaged for a while in teaching Spanish to
a young nobleman. He was then appointed tutor to the two sons
of a M. de la Trousse, grand provost of France. Attached for
the next seventeen years to the family of this gentleman, the
administration of whose fortune was wholly in his hands, he

¹ The only other English sense is that of a printer's workshop, or
the body of compositors in it, who are presided over by a "father
of the chapel."
seems to have published nothing during this period, yet to have acquired a great reputation as a probability. His first work given to the public was a preface for the Adone d’Armin, who printed and published that notorious poem at Paris. This was followed by an excellent translation of Mateo Aleman’s novel, Guillaume de Palachcharé, and by four extremely indifferent odes, one of them addressed to Richelieu. The credit of introducing the law of the dramatic unities into French literature has been claimed for many writers, and especially for the Abbé d’Aubignac, whose Pratique du théâtre appeared in 1657. The theory had of course been enunciated in the Art poétique of J. C. Scaliger in 1651, and subsequently by other writers, but there is no doubt that it was the action of Chapelain that transferred it from the region of theory to that of actual practice. In a conversation with Richelieu in about 1652, reported by the abbé d’Olivet, Chapelain maintained that it was indispensable to maintain the unities of time, place and action, and it is explicitly stated that the doctrine was new to the cardinal and to the poets who were in his pay. French classical drama thus owes the riveting of its letters to Chapelain. Rewarded with a pension of a thousand crowns, and from the first an active member of the newly constituted Academy, Chapelain drew up the plan of the grammar and dictionary and the compilation of which appears to be a principal function of the young institution, and at Richelieu’s command he wrote the Souvenirs de l’Académie sur le Cid. In 1656 he published, in a magnificent form, the first two cantos of his celebrated epic La Pucelle, on which he had been engaged during twenty years. Six editions of the poem were disposed of in eighteen months. But this was the end of the poetic reputation of Chapelain, “the legislator of Parnassus.” Later the slashing satire of Boileau (in this case fairly master of his subject) did its work, and Chapelain (“Le plus grand poète Français qu’il y ait jamais été et du plus solide jugement,” as he is called in Colbert’s list) took his place among the failures of modern art.

Chapelain’s reputation as a critic survived this catastrophe, and in 1663 he was employed by Colbert to draw up an account of contemporary men of letters, destined to guide the king in his distribution of pensions. In this pamphlet, as in his letters, he shows to far greater advantage than in his unfortunate epic. His prose is incomparably better than his verse; his criticisms are remarkable for their justice and generosity; his erudition and kindness of heart are everywhere apparent; the royal attention is directed alike towards the author’s fullest friends and with the present精品.

To him young Racine was indebted not only for kindly and seasonable counsel, but also for that pension of six hundred livres which was so useful to him. The catholicity of his taste is shown by his De la lecture des vieux romans (pr. 1870), in which he praises the chansons de geste, forgotten by his generation. Chapelain refused many honours, and his disinterestedness in this and other cases makes it necessary to receive with caution the stories of Ménage and Tallemant des Réaux, who assert that he was in his old age a miser, and that a considerable fortune was found hoarded in his apartments when he died on the 22nd of February 1674.

There is a very favourable estimate of Chapelain’s merit as a critic in George Saintsbury’s History of Criticism, ii. 256-261. An analysis of La Pucelle is given in pp. 23-39 of Robert Southey’s Jean de Paris, Ed. be the Lettres de Jean Chapelain (ed. P. Tamuz, de Larroque, 1808-1881); Lettres inédites... “A. P. Huet (1658-1673), ed. by L. G. Pellissier, 1894); Julien Duchesne, Les Poèmes épitiques du XVe siècle (1870); the abbé A. Fabre, Les Ennemis de Chapelain (1889); Chapelain et nos deux premières Académies (1890); and A. Muehlan, Jean Chapelain (1893).

CHAPEL-EN-LE-FRITH, a market town in the High Peak parliamentary division of Derbyshire, England, 20 m. S.E. of Manchester, on the London & North-Western and Midland railways. Pop. (1901) 4626. It lies in an upland valley of the Peak district, the hills of which rise above 1,200 ft. in its immediate vicinity. There are paper-works and ironworks, and brewing is carried on. The foundation of the church of St Thomas of Canterbury is attributed to the foresters of the royal forest of Frith or Frith of the Peak early in the 13th century, and from this the town took name. After the defeat of the Scottish forces at Preston by Cromwell in 1648, it is said that 1,500 prisoners were confined in the church at Chapel-en-le-Frith.

CHAPEL HILL, a town of Orange county, North Carolina, U.S.A., about 25 m. N.W. of Raleigh. Top. (1800) 1009; (1810) 1149. It is served by a branch of the Southern railway, connecting at University, 10 m. distant, with the Greensboro & Goldsboro division. The town is best known as the seat of the University of North Carolina (see NORTH CAROLINA), whose campus contains 48 acres. There are cotton and knitting mills and lumber interests of some importance. Chapel Hill was settled late in the 18th century, and was first incorporated in 1851.

CHAPPELLE ARDENTE (Fr. “burning chapel”), the chapel or room in which the corpse of a sovereign or other exalted personage lies in state pending the funeral service. The name is in allusion to the many candles which are lighted round the catafalque. This custom is first chronicled as occurring at the obsequies of Dagonet, 1148.

CHAPERON, originally a cap or hood (Fr. chape) worn by nobles and knights of the Garter in full dress, and after the 16th century by middle-aged ladies. The modern use of the word is of a married or elderly lady (cf. “duenna”) escorting or protecting a young and unmarried girl in public places and in society.

CHAPLAIN, strictly one who conducts service in a chapel (q.v.), i.e. a priest or minister without parochial charge who is attached for special duties to a sovereign or his representatives (ambassadors, judges, &c.), to bishops, to the establishments of nobles, &c., to institutions (e.g. parliament, congress, colleges, schools, workhouses, cemeteries), or to the army and the navy. In some cases a parish priest is also appointed to a chaplaincy, but in so far as he is a chaplain he has no parochial duties. Thus a bishop of the English Church appoints examining chaplains who conduct the examination of candidates for holy orders; such officials generally hold ordinary benefices also. The British sovereign has 36 “Chaplains in Ordinary,” who perform service at St James’s in rotation, as well as 16 “Honorary Chaplains” and 28 “Chaplains of the Household.” There are also royal chaplains in India and Ireland. The Scottish chaplains in ordinary are on the same basis as those in England, but the Irish chaplains are attached to the household of the lord-lieutenant. The Indian civil service appoints a number of clergymen of the Church of England and the Church of Scotland. These clergymen are known as Chaplains, and are subject to the same conditions as other civil servants, being eligible for a retiring pension after 25 years of service. Chaplains are also appointed under the foreign office to embassies, legations, consulates, &c.

Workhouse chaplains are appointed by overseers and guardians on the direction of the Local Government Board, to which alone such chaplains are responsible. Prison chaplains are appointed by the home secretary.

In the British army there are two kinds of chaplains, permanent and occasional. The former, described as Chaplains to the Forces, hold commissions, serving throughout the empire except in India: they include a Chaplain-General who ranks as a major-general, and four classes of subordinate chaplains who rank respectively as colonels, lieutenants-colonels, majors and lieutenants.

Special chaplains (Acting Chaplains for Temporary Service) may be appointed by a secretary of state under the Army Chaplains Act of 1868 to perform religious service for the army in particular districts. The permanent chaplains may be Church of England, Roman Catholic, or Presbyterian; Wesleyans (if they prefer not to accept commissions) may be appointed Acting Chaplains. The Church of England chaplains report to the chaplain-general, while other chaplains report to the War Office direct. In the navy, chaplains are likewise appointed but do not hold official rank. They must have a special ecclesiastical licence from the archbishop of Canterbury. In 1900 a Chaplains’ Department of the Territorial Force was formed; there is no denominational restriction.
In the armies and navies of all Christian countries chaplains are officially appointed, with the single exception of France, where the office was abolished on the separation of Church and State. In the army of the United States of America chaplains are originally appointed by the president, and subsequently are under the authority of the secretary of war, who receives recommendations as regards transfer from department commanders. By act of Congress, approved in April 1904, the establishment of chaplains was fixed at 57 (13 with the rank of major), 13 for the artillery corps and 1 each for the cavalry and infantry regiments. There is no distinction of sect. In the U.S. navy the chaplains are 24 in number, of whom 13 rank as lieutenants, 7 as commanders, 4 as captains.

In the armies of Roman Catholic countries there are elaborate regulations. Where the chaplains are numerous a chaplain-major is generally appointed, but in the absence of special sanction from the pope such officer has no spiritual jurisdiction. Moreover, chaplains must be approved by the ordinary of the locality. In Austria there are Roman Catholic, Greek Church, Jewish and Mahomedan chaplains. The Roman Catholic chaplains are classed as parish priests, curates and assistants, and are subject to an army Vicar Apostolic. In war, at army headquarters there is a Chaplain-General, and there are also chaplains, as well as the Roman Catholic hierarchy. By a decree of the Sacred Congregation of Propaganda (May 15, 1906), the archbishop of Westminster is the ecclesiastical superior of all commissioned Roman Catholic chaplains in the British army and navy, and he is empowered to negotiate with the civil authorities concerning appointments.

In Germany, owing to the fact that there are different religions in the different states, there is no uniform system. In Prussia there are two Feldprobste (who are directly under the war minister), one Lutheran, one Roman Catholic. The latter is a titular bishop, and has sole spiritual authority over soldiers. There are also army corps and divisional chaplains of both faiths. Bavaria and Saxony, both Roman Catholic states, have no special spiritual hierarchy; in Bavaria, the archbishop of Munich and Freysing is ex officio bishop of the army.

The origin of the office of capellanus or capellanus in the medieval church is generally traced (see Du Cange, Gloss. med. et infin. Latin.) to the appointment of persons to watch over the soldiers in the camp, whose task it was to raise the dead and preside at their burial. They were preserved as a relic by the French monarchs. In time of war this cloak was carried in the army in the field, and was kept in a tent which itself came to be known as a capella or capella. It is also suggested that the capella was simply the tent or canopy which the French kings erected over the altar in the field for the worship of the soldiers. However this may be, the name capellanus was generally applied to those who were in charge of sacred relics: such clerics were also known as custodes, martyrarii, cubicularii. Thus we hear of a custos palatine capellae who was in charge of the palace chapel relics, and guarded them in the field; the chief of these custodes was sometimes called the archi-capellanus. From the care of sacred relics preserved in royal chapels, &c. (so called capellanus, the office of capellanus naturally extended its scope until it covered practically that of the modern court chaplain, and was officially recognized by the Church. These clerics became the confessors in royal and noble houses, and were generally chosen from among bishops and other high dignitaries. The arch-chaplain not only received jurisdiction within the kingdom, but represented the authority of the monarch in religious matters, and also acquired more general powers. In France the arch-chaplain was grand-almoner, and both in France and in the Holy Roman Empire was also high chancellor of the realm. The office was abolished in France at the Revolution in 1789, revived by Pius IX. in 1857, and again abolished on the fall of the Second Empire.

The Roman Catholic Church also recognizes a class of beneficiated chaplains, supported out of "pious foundations" for the specific duty of saying, or arranging for, certain masses, or taking part in certain services. These chaplains are classified as follows:--

Ecclesiastical, if the foundation has been recognized officially as a benefice; Lay, if this recognition has not been obtained; Mercedarian, if the person who has been entrusted with the duty of performing or procuring the desired celebration is a layman (such persons also are sometimes called "lay chaplains"); Collative, if it is provided that a bishop shall collate or confer the right to act upon the accepted candidate, who otherwise could not be recognized as an ecclesiastical chaplain. There are elaborate regulations governing the appointment and conduct of these chaplains.

Other classes of chaplains are:--(1) Parochial or Auxiliary Chaplains, appointed either by a parish priest (under a provision authorized by the Council of Trent) or by a bishop to over certain specified duties which he is unable to perform; (2) Chaplains of Convents, appointed by a bishop: these must be men of mature age, should not be regulars unless secular priests cannot be obtained, and are not generally to be appointed for life; (3) Pontifical Chaplains, some of whom (known as Private Chaplains) assist the pontiff in the celebration of Mass; others attached directly to the pope are honorary private chaplains who occasionally assist the private chaplains, private clerics of the chapel, common chaplains and supernumerary chaplains. The common chaplains were instituted by Alexander VII., and in 1907 were definitely allowed the title "Monsignore" by Pius X.

CHAPLIN, HENRY (1841— ), English statesman, second son of the Rev. Henry Chaplin, of Blankney, Lincolnshire, was educated at Harrow and Christ Church, Oxford, and first entered Parliament in 1868 as Conservative member for Mid-Lincolnshire. He represented this constituency (which under the Redistribution Act of 1885 became the Sleaford division) till 1906, when he was defeated, but in 1907 returned to the House of Commons as member for Wimbledon at a by-election. In 1876 he married a daughter of the 3rd duke of Sutherland, but lost his wife in 1881. Outside the House of Commons he was a familiar figure on the Turf, winning the Derby with Hermit in 1867; and in politics from the first the "Square of Blankney" took an active interest in agricultural questions, as a popular and typical representative of the English "country gentleman" class.

Having filled the office of chancellor of the duchy of Lancaster in Lord Salisbury's short ministry of 1885–1886, he became president of the new Board of Agriculture in 1889, with a seat in the cabinet. In 1892 he was placed in the office of the Board of Trade as the chairman of the newly constituted Board of Agriculture. He was minister of agriculture in the Liberal government of 1892–1895, and was minister of agriculture in the Liberal government of 1895–1896. He was a member of the Privy Council of the United Kingdom from 1899 to 1905, and was president of the Local Government Board, and was responsible for the Agricultural Rates Act of 1890; but he was not included in the ministry after its reconstruction in 1900. Mr Chaplin had always been an advocate of protectionism, being in this respect the most prominent inheritor of the views of Lord George Bentinck; and when in 1903 the Tariff Reform movement began under Mr Chamberlain's leadership, he gave it his enthusiastic support, becoming a member of the Tariff Commission and one of the most strenuous advocates in the country of the new doctrines in opposition to free trade.

CHAPMAN, GEORGE (? 1550–1644), English poet and dramatist, was born near Hitchin. The inscription on the portrait which forms the frontispiece of The Whole Works of Homer states that he was then (1616) fifty-seven years of age. Anthony à Wood (Athen. Oxon. ii. 575) says that about 1574 he was sent to the university, "but whether first to this of Oxon, or that of Cambridge, is to me unknown; sure I am that he spent a time in the latter, for he was observed to be most excellent in the Latin and Greek tongues, but not in logic or philosophy." Chapman's first extant play, The Blind Beggar of Alexandria, was produced in 1596, and two years later Francis Meres mentions him in Palladis Tamia among the "best for tragedy" and the "best for comedy." Of his life between leaving the university and settling in London there is no account. It has been suggested, from the detailed knowledge displayed in The Shadow of Night of an incident in Sir Francis Vere's campaign, that he saw service in the Netherlands. There are frequent entries with regard to Chapman in Henslowe's diary for the years 1598–1599, but his dramatic activity slackened during
the following years, when his attention was chiefly occupied by his Homer. In 1604 he was imprisoned with John Marston for his share in Eastward Ho, in which offence was given "all glorious party at court. Ben Jonson voluntarily joined the two, who were soon released. Chapman seems to have enjoyed favour at court, where he had a patron in Prince Henry, but in 1605 Jonson and he were for a short time in prison again for "a play," Beaumont, the French ambassador in London, in a despatch of the 4th of April 1608, writes that he had obtained the prohibition of a performance of Biron in which the queen of France was represented as giving Mademoiselle de Verneuil a box on the ears. He adds that three of the actors were imprisoned, but that the chief culprit, the author, had escaped (Raumer, Briefe aus Paris, 1831, ii. 276). Among Chapman's patrons was Robert Carr, earl of Somerset, to whom he remained faithful after his disgrace. Chapman enjoyed the friendship and admiration of his great contemporaries. John Webster in the preface to The White Devil praised "his full and heightened style," and Ben Jonson told Drummond of Hawthorned that Fletcher and Chapman "were loved of him." These friendly relations appear to have been interrupted later, for there is extant in the Ashmole MSS. an "Inventive written by Mr George Chapman against Mr Ben Jonson." Chapman died in the parish of St Giles in the Fields, and was buried on the 12th of May 1634 in the churchyard. A monument to his memory was erected by Inigo Jones.

(M. Br.)

Chapman, his first biographer is careful to let us know, "was a person of most reverend aspect, religious and temperate, qualities rarely meeting in a poet"; he had also certain other merits at least as necessary to the exercise of that profession. He had a singular force and solidity of thought, an admirable air of charity devoted to the service of poetry, a deep and burning sense at once of the duty implied and of the dignity inherent in his office; a vigour, opulence, and loftiness of phrase, remarkable even in that age of spiritual strength, wealth, and exaltation of thought and style; a robust eloquence, touched not unfrequently with flashes of fancy, and kindled at times into heat of imagination. The main fault of his style is one more commonly found in the prose than in the verse of his time,—a quaint and florid obscurity, rigid with elaborate rhetoric and tortuous with labyrinthine illustration; not dark only to the rapid reader through closeness and subtlety of thought, like Dido's word, which no one knows globes within," as thick and slab as a witch's grud with forestal and barbarous eccentricities of articulation. As his language in the higher forms of comedy is always pure and clear, and sometimes exquisite in the simplicity of its earnest and natural grace, the stiffness and density of his more ambitious style may perhaps be attributed to some pernicious theory or conceit of the dignity proper to a moral and philosophic poet. Nevertheless, many of the gnomic passages in his tragedies and allegoric poems are of singular weight and beauty; the best of these, indeed, would not discredit the fame of the very greatest poets for sublimity of equal thought and expression: witness the lines chosen by Shelley as the motto for a poem, and fit to have been chosen as the motto for his life.

The romantic and sometimes barbaric grandeur of Chapman's Homer remains attested by the praise of Keats, of Coleridge and of Lamb; it is written at a pitch of strenuous and laborious exaltation, which never flags or breaks down, but never flies with the ease and smoothness of an eagle native to Homeric air. From his occasional poems an expert and careful mind might easily gather noble fruits of excellence, chiefly grandiose or meditative, allegoric or descriptive. The notable examples of his tragic work are comprised in the series of plays taken, and adapted sometimes with singular licence, from the records of such part of French history as lies between the reign of Francis I. and the reign of Henry IV., ranging in date of subject from the trial and death of Admiral Chabot to the treason and execution of Marshal Biron. The two plays bearing as epigraph the name of that famous soldier and conspirator are a storehouse of lofty thought and splendid verse, with scarcely a flash or spark of dramatic action. The one play of Chapman's whose popularity on the stage survived the Restoration is Bucoliques d'Amboise,—a tragedy not lacking in violence of action or emotion, and abounding even more in sweet and sublime interludes than in crabbed and bombastic passages. His rarest jewels of thought and verse detachable from the context lie embedded in the tragedy of Caesar and Pompeo, whence the finest of them were first extracted by the unerring and unequalled critical genius of Charles Lamb. In most of his tragedies the lofty and labouring spirit of Chapman may be said rather to shine fitfully through parts than steadily to pervade the whole; they show nobly altogether as they stand, but even better by help of excerpts and selections. But the excellence of his best comedies can only be appreciated by a student who reads them fairly and fearlessly through, and, having made some small deductions on the score of occasional pedantry and occasional indelicacy, finds in All Fools, Monstre d'Olive, The Gentleman Usur, and The Widow's Tears a wealth and vigour of humorous invention, a tender and earnest grace of romantic poetry, which may atone alike for these passing blemishes and for the lack of such clear-cut perfection of character and such dramatic progression of interest as we find only in the yet higher poets of the English stage.

So much it may suffice to say of Chapman as an original poet, one who held of no man and acknowledged no master, but from the birth of Marlowe well-nigh to the death of Jonson held on his own hard and haughty way of austere and sublime ambition, not without kindly and graceful inclination of his high grey head to salute such younger and still nobler companions as Jonson and Fletcher. With Shakespeare we should never have guessed that he had come at all in contact, had not the keen intelligence of William Minto divined or rather discerned him to be the rival poet referred to in Shakespeare's sonnets with a grave note of passionate satire, hitherto as enigmatic as almost all questions connected with those divine and dangerous poems. This conjecture Professor Minto fortified by such apt collocation and confrontation of passages that we may now reasonably accept it as an ascertained and memorable fact.

The objections which a just and adequate judgment may bring against Chapman's master-work, his translation of Homer, may be summed up in three epithets: it is romantic, laborious, Elizabethan. The qualities implied by these epithets are the very ones which distinguish a translator of Homer; but setting this apart, and considering the poems as mere original works, the structure of a romantic poet on the submerged foundations of Greek verse, no praise can be too warm or high for the power, the freshness, the indefatigable strength and inextinguishable fire which animate this exalted work, and secure for all time that shall take cognizance of English poetry an honoured place in its highest annals for the memory of Chapman.

Chapman's works include:— 26e versos: The Shadow of Night: Containing two Poetical Hymnes . . . (1594), the second of which deals with Sir Francis Vere's campaign in the Netherlands; Ovid's Metamorphoses; and the poem called His Amorous Zodiacke with a translation of a Latine cyppe, written by a Fryer, Anno Dom. 1595 (1595, 2nd ed. 1639), a collection of poems frequently quoted from in England's Parnassus (1600); "De Homer iambico epicum," a poem prefixed to Lawrence Keymis's A Relation of the second voyage to Guiana (1596); Hero and Leander. Begun by Christopher Marlowe; and finished by George Chapman (1598); The Blinde beggar of Alexandria, most pleasantly discovering the faults of the world, and the vanity of all human couzenry in the world; or, a Pleasant Comedy; A Pleasant Comedy entitled An Humorous doyes Myth (identified by Mr Fley with the "Comedy of Umero" noted by Henslowe on the 11th of May 1597; printed 1599); At Fools, A Trick of Fools, a pastoral comedy by Chapman on the 11th of July 1599. Its original name being "The World runs on where in," as Gentleman Usher (c. 1601, pr. 1606). a comedy; Monstre d'Olive (1604, pr. 1606), one of his most amusing and successful comedies; Eastward Hoe (1606), written in conjunction with Ben Jonson and John Marston, an excellent comedy of city life; Bussy d'Ambois, A

Chapman's source in this piece remains undetermined. It cannot be the Historia sui temporis of Jacques de Thom, for the 4th volume of his work, which relates the story, was not published until 1609 (see Koeppel, p. 14).
Tragedie (1654, pt. 1607, 1608, 1616, 1641, &c.), the scene of which is laid in the court of Henry III.; The Revenge of Bussy d’Ambois. A Tragedie (1613, but probably written much earlier); The Conspiracie, And Tragedie of Charles Duke of Byron. Marshall of France (1607); The May-Day, A witty Comedie (1611; but probably acted as early as 1601); The widdowes Teares. A Comedie (1612; produced perhaps as early as 1603); Caeser and Pompey: A Roman Tragedie, designed in imitation of what had been extolled by Propertius. Only a just man is a freeman (1631), written, says Chapman in the dedication, "long since," but never staged.

The Tragedy of Alphonso Emperor of Germany (see the edition by Mr. Glathorne, 1629), The Whole Works of Homer: Prince of Poets. In his Iliads and Odysseys... appeared in 1616, and about 1624 he added The Croune of all Homers works Batrachomyomachia or the Battlle of Frogs and Mice. His Hymns and Epigrams. But the whole works had been already published under his name. Seven Books of Homer had appeared in 1599, Achilles Shield in the same year, books i.-ix. about 1600; in 1613 The Iliads of Homer, Prince of Poets...; and in 1614 Twenty-Four Books of Homer’s Odes were published. In 1609 Richard Hakluyt published his Discoveries, with Henry Enkleymie Raptus; or the Teares of Peace, and on the death of his patron he contributed An Epidece, or Funerall Song (1612). A paraphrase of Petrearch Seven Penitentiall Psalms (1612), a poem in honour of the marriage of Robert Carr, earl of福stantine, in which the poet is addressed as "Dias". Eschylus is indirectly entitled Andromeda Liberata... (1614), a translation of The Georgicks of Ilesios (1618), Pro Vere Autumni Lachrymea (1622), in honour of Sir Horatio Vere. A justification of the Strangers of Nero... (1616), by Samuel Sewele (1616) and George Chapman (1614), an elegy on Sir William Russell, complete the list of his separately published works.

Chapman’s Homer was edited in 1857 by the Rev. Richard Hooper, and supplemented his dramatic works appeared in 1873. The standard edition of Chapman is the Works, edited by R. H. Shepherd (1874—1875), the third volume of which contains an "Essay on the Poetical and Dramatic works of George Chapman," by Mr Swinburne, printed second series. These shows the selection of his plays (1885) for the Mermaid Series is edited by Mr W. L. Phelps. For the sources of the plays see Emile Koeppel, "Anellen Studien zu den Dramen George Chapman’s, Philip Massinger’s und John Ford’s" in Quellen und Forschungen zur Sprache und Literatur I (1893). The suggestion of W. Minto (see Characteristics of the English Poets, 1885) that Chapman was the "rival poet" of Shakespeare’s sonnets is amplified in Mr. A. Acheson’s Shakespeare and the Rival Poet 1903. Morris, in his introduction to a new edition of the Poets, 1890, has added it. For other criticisms of his translation of Homer see Matthew Arnold, Lectures on translating Homer (1861), and Dr A. Lohff, George Chapman’s Hiss-Übersetzung (Berlin, 1903).

PONE, HESTER (1727-1801), English novelist. The daughter of Thomas Mulso, a country gentleman, was born at Twywell, Northamptonshire, on the 27th of October 1727. She was a precocious child, and at the age of nine wrote a romance entitled The Loves of Amoret and Melissa. Heacy Mulso, as she was familiarly called, developed a beautiful voice, which earned her the name of "the linnet." While on a visit to Canterbury she made the acquaintance of the learned Mrs Elizabeth Carter, and soon became one of the admirers of the novelist Samuel Richardson. She was one of the little court of women who gathered at North End, Fulham; and in Miss Susannah Highmore’s sketch of the novelist reading Sir Charles Grandison to his friends Miss Mulso is the central figure. She corresponded with Richardson on trivial obedience in letters as long as his own, signing herself his "ever obliged and affectionate child." She admired, however, with discrimination, and in the words of her biographer (Posthumous Works, 1807, p. 40) "she had an elegance and dignity in her manners, a spirit of confined modesty and genuine humility, she could maintain her own well-grounded opinion."

In 1760 Miss Mulso, with her father’s reluctant consent, married the attorney, John Chapone, who had been befriended by Richardson. Her husband died within a year of her marriage. Mrs Chapone remained in London visiting various friends. She had already made small contributions to various periodicals when she published, in 1772, her best known work, Letters on the Improvement of the Mind. This book brought her numerous requests from distinguished persons to undertake the education of their children. She died on the 25th of December 1801.

See The Posthumous Works of Mrs Chapone, containing her correspondence with Mr Richardson; a series of letters to Mrs Elizabeth Carter... together with an account of her life and character drawn up by her own family (1807).

CHAPPE, CLAUDE (1763—1805), French engineer, was born at Brûlon (Sarthe) in 1763. He was the inventor of an optical telegraph which was widely used in France until it was superseded by the electric telegraph. His device consisted of an upright post, on the top of which was fastened a transparent bar, while at the ends of the latter two smaller arms moved on pivots. The position of these bars represented words or letters; and by means of machines placed at intervals such that each was distinctly visible from the next, messages could be conveyed through 10 leagues in a quarter of an hour. The machine was adopted by the Legislative Assembly in 1792, and in the following year Chappe was appointed ingénieur-télégraphe; but the originality of his invention was so much questioned that he was seized with melancholia and (it is said) committed suicide at Paris in 1805.

His elder brother, Ignace Urbain Jean Chappe (1766—1829), took part in the invention of the telegraph, and with a younger brother, Pierre François, from 1805 to 1823 was administrator of the telegraphs, a post which was also held by two other brothers, René and Abraham, from 1825 to 1830. Ignace was the author of Histoire de la télégraphie (1824). An uncle, Jean Chappel d’Auteroche (1769—1840), was an astronomer who observed two transits of Venus, one in Siberia in 1761, and the other in 1766 in California, where he died.

CHAPPELL, WILLIAM (1809—1888), English writer on music, a member of the London musical firm of Chappell & Co., was born on the 20th of November 1809, eldest son of Samuel Chappell (d. 1834), who founded the business. William Chappell is particularly noteworthy for his starting the Musical Antiquarian Society in 1840, and his publication of the standard work Popular Music of the Old Time (1855—1859)—an expansion of a collection of "national English airs" made by him in 1838—1840. The modern revival of interest in English folk-songs owes much to this work, which has since been re-edited by Professor H. E. Woolridge (1893). W. Chappell died on the 20th of August 1888. His brother, Thomas Patey Chappell (d. 1902), meanwhile had largely extended the publishing business, and had started (1859) the Monday and Saturday Popular Concerts at St James’s Hall, which were successfully managed by a younger brother, S. Arthur Chappell, till they came to an end towards the close of the century.

CHAPRA, or CHUPRA, a town of British India, the administrative headquarters of Saran district in Bengal, near the left bank of the river Gogra, just above its confluence with the Ganges; with a railway station on the Bengal & North-Western line towards Oudh. Pop. (1901) 45,901, showing a decrease of 21% in the decade. There are a government high school, a German Lutheran mission, and a public library endowed by a former maharaja of Hatwa. Chapra is the centre of trade in indigo and saltpetre, and conducts a large business by water as well as by rail.

CHAPITAL, JEAN ANTOINE CLAUDE, COMTE DE CHANTELOUP (1756—1832), French chemist and statesman, was born at Nogaret, Lozère, on the 4th of June 1756. The son of an apothecary, he studied chemistry at Montpellier, obtaining his Licentiate in medicine in 1780, and in 1782 when he returned to Paris, who on the States of Languedoc founded a chair of chemistry for him at the school of medicine in Montpellier, where he taught the doctrines of Lavosier. The capital he acquired by the death of a wealthy uncle he employed in the establishment of chemical
works for the manufacture of the mineral acids, alum, white-lead, soda and other substances. His labours in the cause of applied science were at length recognized by the French government, which presented him with letters of nobility, and the cordon of the order of Saint Michel. During the Revolution a publication by Chaptal, entitled Dialogue entre un Montagnard et un Girondin, caused him to be arrested; but being speedily set at liberty through the artifice of a friend, he undertook the management of the saltpetre works at Grenelle. In the following year he went to Montpellier, where he remained till 1797, when he returned to Paris. After the coup d'État of the 18th of Brumaire (November 9, 1799) he was made a councillor of state by the First Consul, and succeeded Lucien Bonaparte as minister of the interior, in which capacity he established a chemical manufactory near Paris, a school of arts, and a society of industries; he also reorganized the hospitals, introduced the metrical system of weights and measures, and otherwise greatly encouraged the arts and sciences. A misunderstanding between him and Napoleon (who conferred upon him the title of comte de Chanteloup) occasioned Chaptal's retirement from office in 1804; but before the end of that year he was again received into favour by the emperor, who bestowed on him the grand cross of the Legion of Honour, and made him treasurer to the conservative senate. On Napoleon's return from Elba, Chaptal was made director-general of commerce and manufactures and a minister of state. He was obliged after the downfall of the emperor to retire, and was reconciled to the government only after consideration had been given to his name on the list of the peers of France until 1816. In 1816, however, he was nominated a member of the Academy of Sciences by Louis XVIII.

Chaptal was especially a popularizer of science, attempting to apply to industry and agriculture the discoveries of chemistry. In this way he contributed largely to the development of modern industry. He died at Paris on the 30th of July 1832.

His literary works exhibit both vigour and perspicuity of style; he wrote, in addition to various articles, especially in the Annales de chimie, Éléments de chimie (3 vols, 1790; new ed., 1796-1803); Traité du salpêtre et des goudrons (1790); Tableau des principaux sels terreux (1798); Essai sur le perfectionnement des arts chimiques en France (1806); Art de faire, de gouverner, et de perfectionner les vins (1 vol., 1801; new ed., 1819); Traité théorique et pratique sur la culture de la vigne, &c. (2 vols., 1801; new ed., 1811); Essai sur le blanchiment (1801); La Chimie appliquée aux arts (4 vols., 1806); Art de la teinture du coton en rouge (1807); Art du teinturier et du drapeur industrie français (2 vols., 1819); Chimie appliquée à l'agriculture (2 vols., 1825; new ed., 1826).

CHAPTER (a shortened form of chapitre, a word still used in architecture for a capital; derived from O. Fr. chapitre, Lat. capitellum, diminutive of caput, head), a principal division or section of a book, and so applied to acts of parliament, as forming “chapters” or divisions of the legislation of a session of parliament. The name “chapter” is given to the permanent body of the canons of a cathedral or collegiate church, presided over, in the English Church, by the dean, and in the Roman communion by the provost or the dean, and also to the body of the members of a religious order. This may be a “conventional” chapter of the monks of a particular monastery, “provincial” of the members of the order in a province, or “general” of the whole order. This ecclesiastical use of the word arose from the custom of reading a chapter of Scripture, or a head (capitulum) of the regula, to the assembled canons or monks. The transference from the reading to the assembly itself, and to the members constituting it, was easy, through such phrases as convenire ad capitulum. The title “chapter” is similarly used of the assembled body of knights of a military or other order. (See also Canon; Cathedral; Dean.)

CHAPTER-HOUSE (Lat. capitellum, Ital. capitolo, Fr. chapitre, Ger. Kapitelhaus), the chamber in which the chapter or heads of the monastic bodies (see Abbey and Cathedral) assembled to transact business. They are of various forms; some are oblong apartments, as Canterbury, Exeter, Chester, Gloucester, &c.; some octagonal, as Salisbury, Westminster, Wells, Lincoln, York, &c. That at Lincoln has ten sides, and that at Worcester is circular; most are vaulted internally and polygonal externally, and some, as Salisbury, Wells, Lincoln, Worcester, &c., depend on a single slight vaulting shaft for the support of the massive vaulting. They are often provided with a vestibule, as at Westminster, Lincoln, Salisbury and are almost exclusively English.

CHAPU, formerly an important maritime town of China, in the province of Cheh-kiang, 30 m. N.W. of Chên-hai, situated in one of the richest and best cultivated districts in the country. It is the port of Hang-chow, with which it has good canal communication, and it was formerly the only Chinese port trading with Japan. The town has a circuit of about 5 m. exclusive of the suburbs that lie along the beach; and the Tatar quarter is separated from the rest by a wall. It was captured and much injured by the British force in 1842, but was abandoned immediately after the engagement. The sea around it has now silted up, though in the middle of the 19th century it was accessible to the light-draughts of the British fleet.

CHAR (Salvelinus), a fish of the family Salmonidae, represented in Europe, Asia and North America. The best known and most widely distributed species, the one represented in British and Irish lakes, is S. alpinus, a graceful and delicious fish, covered with very minute scales and usually dark olive, bluish or purplish black above, with or without round orange or red spots, pinkish white or yellowish pink to scarlet or claret red below. When the char go to sea, they assume a more silvery coloration, similar to that of the salmon and sea trout; the red spots become much indistinct and the lower parts are almost white. The very young are also silvery on the sides and white below, and bear 11 to 15 branchial gill membranes, which are divided internally into two rows, the upper one being directed to localities, and the difference in colour, together with a few points of doubtful constancy, have given rise to the establishment of a great number of untenable so-called species, as many as seven having been ascribed to the British and Irish fauna, viz. S. alpinus, nivalis, killinensis, willoughbyi, perisii, calli and grayi, the last from Lough Melvin, Ireland, being the most distinct. S. alpinus varies much in size according to the waters it inhabits, remaining in some English lakes, and growing to 2 ft. or more in other localities. In other parts of Europe, also, various local forms have been distinguished, such as the “omble chevalier” of the lakes of Switzerland and Savoy (S. umbila), the “Säibling” of the lakes of South Germany and Austria (S. salvelinus), the “kullumund” of Norway (S. carolynius), &c., while the North American S. parkei, alipes, stagnalis, archurus, areolus, aquassa and marsonia may also be regarded as varieties. Taken in this wide sense, S. alpinus has a very extensive distribu-

In central Europe, in the British islands and in the greater part of Scandinavia it is confined to mountain lakes, but farther to the north in both the Old World and the New, it lives in the sea and ascends rivers to spawn. In Lapland, Iceland, Greenland and other parts of the arctic regions, it ranks among the commonest fishes. The extreme northern point at which char have been obtained is 82° 34' N. (Victoria lake and Floeberg Bay, Arctic America). It reaches an altitude of 2600 ft. in the Alps and 6000 ft. in the Carpathians.

The American brook char, S. fontinalis, is a close ally of S. alpinus, differing from it in having fewer and shorter gill-rakers, a rather stouter body, the back more or less barred or marbled with dark olive or black, and the dorsal and caudal fins mottled or barred with black. Many local varieties of colour have been distinguished. Sea-run individuals are often nearly plain bright silvery. It is a small species, growing to about 18 in. abundant in all clear, cold streams of North America, east of the Mississippi, northward to Labrador. The fish has been introduced into other parts of the United States, and also into Europe.

Another member of the same section of Salmonidae is the Great Lake char of North America, S. namaycush, one of the largest salmonoids, said to attain a weight of 100 lb. The body is very elongate and covered with extremely small scales. The colour varies from grey to black, with numerous round pale spots, which may be tinged with reddish; the dorsal and caudal fins reticulate with darker. This fish inhabits the Great Lakes regions and neighbouring parts of North America.

CHAR-À-BANC (Fr. for “benched carriage”), a large form of wagonette-like vehicle for passengers, but with benched seats
arranged in rows, looking forward. Commonly used for large parties, whether as public conveyances or for excursions.

**Character** (Gr. *charaktēρ*, from *kāρactēr*, to scratch), a distinctive mark (spelt "character" up to the 16th century, with other variants); so applied to symbols of notation or letters of the alphabet; more figuratively, the distinguishing traits of anything, and particularly the moral and mental qualities of an individual human being, the sum of those qualities which distinguish him as a personality. From the latter usage "a character" becomes almost identical with "reputation"; and in the sense of "giving a servant a character," the word involves a written testimonial. For the law relating to servants' characters see **Master and Servant**. A further development is the use of "character" to mean an "odd or eccentric person"; or of a "character actor," to mean an actor who plays a highly-coloured strange part. The word is also used as the name of a form of literature, consisting of short descriptions of types of character. Well-known examples of such "characters" are those of Theophrastus and La Bruyère, and in English, of Joseph Hall (1574–1636) and Sir Thomas Overbury.

**Charade**, a kind of riddle, probably invented in France during the 18th century, in which one or two more syllables is distinctive by combining into one word (the answer) the different syllables, each of which is described, as an independent word, by the giver of the charade. Charades may be either in prose or verse. Of poetic charades those by W. Mackworth Praed are well known and excellent examples, while the following specimens in prose may suffice as illustrations. "My first, with the most rooted antipathy to a Frenchman, prides himself, whenever they meet, upon sticking close to his jacket; my second has many virtues, nor is it least that it gives its name to my first; my whole may I never catch!" "My first is company; my second shuns company; my third collects company; and my whole amuses company." The solutions are Tar-tar and Co-nun-drum. The most popular form of this amusement is the acted charade, in which the meaning of the different syllables is acted out on the stage, the audience being left to guess each syllable and thus, combining the meaning of all the syllables, the whole word. A brilliant example of the acted charade is described in Thackeray's *Vanity Fair*.

**Charcoal**, the black substance consisting of absolutely carbon obtained by removing the volatile constituents of animal and vegetable substances; wood gives origin to wood-charcoal; sugar to sugar-charcoal; bone to bone-charcoal (which, however, mainly consists of calcium phosphate); while coal gives "coke" and "gas-carbon." The first part of the word charcoal is of obscure origin. The independent use of "char," meaning to scorch, to reduce to carbon, is comparatively recent, and must have been taken from "charcoal," which is quite early. The *New English Dictionary* gives as the earliest instance of "char" a quotation dated 1679. Similarly the word "chark" or "chak," meaning the same as "char," is also late, and is probably due to a wrong division of the word "charcoal," or, as it was often spelled in the 16th and 17th centuries, "charkle" and "charke-coal." No suggestions for an origin of "char" are satisfactory. It may be a use of the word "chare," which appears in "charwoman," the American "chore"; in all these words it means "turn," a turn of work, a job, and "charcoal" would have to mean "turned coal," i.e., wood changed or turned to coal, a somewhat forced derivation, for which there is no authority. Another suggestion is that it is identical with "chirk" or "chark," an old word meaning "to make a grating noise."

**Wood-charcoal**—In districts where there is an abundance of wood, as in the forests of France, Austria and Sweden, the operation of charcoal-burning is of the crudest description. The method, which dates back to a very remote period, generally consists in piling billets of wood on their ends so as to form a conical pile, openings being left at the bottom to admit air, with a central shaft to serve as a flue. The whole is covered with turf of moistened soil. The firing is begun at the bottom of the flue, and gradually spreads outwards and upwards. The success of the operation—both as to the intrinsic value of the product and its amount—depends upon the rate of the combustion. Under average conditions, 10 parts of wood yield about 60 parts by volume, or 15 parts by weight, of charcoal. The modern process of charcoalising wood—either in small pieces or as sawdust—in cast iron retorts is extensively practised where wood is scarce, and also by reason of the recovery of valuable by-products (wood spirit, pyroligneous acid, wood-tar), which the process permits. The question of the temperature of the carbonization is important; according to J. Percy, wood becomes brown at 220° C, a deep brown-black after some time at 280°, and an easily powdered mass at 310°. Charcoal made at 300° is brown, soft and friable, and readily inflames at 380°; made at higher temperatures it is hard and brittle, and does not fire until heated to about 700°. One of the most important applications of wood-charcoal is as a constituent of gunpowder (q.v.). It is also used in metallurgical operations as a reducing agent, but its application has been diminished by the introduction of coke, anthracite smalls, &c. A limited quantity is made up into the form of drawing crayons; but the greatest amount is used as a fuel.

The porosity of wood-charcoal explains why it floats on the surface of water, although it is actually denser, its specific gravity being greater than that of water. Wood charcoal possesses the property of absorbing gases and vapours; at ordinary temperatures ammonia and cyanogen are most readily taken up; and Sir James Dewar has utilized this property for the preparation of high vacua at low temperatures. This character is commercially applied in the use of wood-charcoal as a disinfectant. The fetid gases produced by the putrefaction and waste of organic matter enter into the pores of the charcoal, and there meet with the oxygen previously absorbed from the atmosphere; oxidation ensues, and the noxious effluvia are decomposed. Generally, however, the action is a purely mechanical one, the gases being only absorbed. Its pharmacological action depends on the same property; it absorbs the gases of the stomach and intestines (hence its use in cases of flatulence), and also liquids and solids. Wood-charcoal has also the power of removing colouring matters from solutions, but this property is possessed in a much higher degree by animal-charcoal.

**Animal-charcoal or bone black** is the carbonaceous residue obtained by the dry distillation of bones; it contains only about 10% of bone; the remainder being calcium and magnesium phosphates (80%) and other inorganic material, bone being the most abundant in the bones. It is generally manufactured from the residues obtained in the glue (q.v.) and gelatin (q.v.) industries. Its decolorizing power was applied in 1812 by Derosne to the clarification of the syrups obtained in sugar-refining; but its use in this direction has now greatly diminished, owing to the introduction of more active and easily managed reagents. It is still used to some extent in laboratory practice. The decolorizing power is not permanent, becoming lost after using for some time; it may be revived, however, by washing and reheating.

**Lampblack or soot** is the familiar product of the incomplete combustion of oils, pitch, resins, tallow, &c. It is generally prepared by burning pitch residues (see COAL-TAR) and condensing the product. Thus obtained it is always oily, and, before using as a pigment, it must be purified by ignition in closed crucibles (see CARBON).

**Charcot, Jean Martin** (1825–1893), French physician, was born in Paris on the 29th of November 1825. In 1853 he graduated as M.D. of Paris University, and three years later was 10% of bone, the remainder being calcium and magnesium phosphates (80%) and other inorganic material. In 1866 he became professor of pathological anatomy in the medical faculty of Paris, and in 1862 began that famous connexion with the Salpêtrière which lasted to the end of his life. He was elected to the Academy of Medicine in 1873, and ten years afterwards became a member of the Institute. His death occurred suddenly on the 16th of August 1893 at Morvan, where he had gone for a holiday. Charcot, who was a good linguist and well acquainted with the literature of his own as well as of other countries, excelled as a clinical observer and a pathologist. His work at the Salpêtrière exerted a great influence on the development of the science of neurology, and his classical *Leçons sur les maladies du*
systeme nerveux, the first series of which was published in 1837, represents an enormous advance in the knowledge and discrimination of nervous diseases. He also devoted much attention to the study of obscure morbid conditions like hysteria, especially in relation to hypnotism (q.v.); indeed, it is in connexion with his investigation into the phenomena and results of the latter that his name is popularly known. In addition to his labours on neurological and even physiological problems he made many contributions to other branches of medicine, his published works dealing, among other topics, with liver and kidney diseases, gout and pulmonary phthisis. As a teacher he was remarkably successful, and always commanded an enthusiastic band of followers.

CHARD, JOHN ROUSE MERRIOTT (1847–1897), British soldier, was born at Boxhill, near Plymouth, on the 21st of December 1847, and in 1868 entered the Royal Engineers. In 1878 Lieutenant Chard was ordered to South Africa to take part in the Zulu War, and was stationed at the small post of Rorke's Drift to protect the bridges across the Buffalo river, and some sick men and stores. Here, with Lieutenant Conville Bromhead (1836–1891) and eighty men of the 2nd 24th Foot, he heard, on the 22nd of January 1879, of the disaster of Isandhlwana from some fugitives who had escaped the slaughter. Believing that the victorious Zulus would attempt to cross into Natal, they prepared hastily, to hold the Drift until help should come. They barricaded and loopholed the old church and hospital, and improvised defences from wagons, mealie sacks and bags of Indian corn. Early in the afternoon they were attacked by more than 3000 Zulus, who, after hours of desperate hand-to-hand fighting, carried the outer defences, an inner low wall of biscuit boxes, and the hospital, room by room. The garrison then retired to the stone kraal, and repulsed attack after attack through the night. The next morning relieving forces appeared, and the enemy retired. The spirited defence of Rorke's Drift saved Natal from a Zulu invasion, and Chard's and Bromhead's gallantry was rewarded with the V.C. and immediate promotion to the rank of captain and brevet-major. On Chard's return to England he became a popular hero. From 1893–1896 he commanded the Royal Engineers at Singapore, and was made a colonel in 1897. He died the same year at Hatch-Beauchamp, near Taunton, on the 1st of November.

CHARD, a market town and municipal borough in the Southern parliamentary division of Somersetshire, England, 12° 1/2 m. W. by S. of London by the London & South Western railway. Pop. (1901) 4437. It stands on high ground within 1 m. of the Devonshire border. Its cruciform parish church of St Mary the Virgin is Perpendicular of the 15th century. A fine east window is preserved. The manufactures include linen, lace, woolens, brasswae and ironware. Chard is governed by a mayor, 4 aldermen and 12 councillors. Area, 444 acres.

Chard (Cerne, Chere, Cerde) was commercial in origin, being a trade centre near the Roman road to the west. There are two Roman villas in the parish. There was a British camp at Northwood. The Bishop of Bath held Chard in 1086, and his successor granted in 1334 the first charter which made Chard a free borough, each burgage paying a rent of 12d. Trade in hides was forbidden to non-burgesses. This charter was confirmed in 1253, 1280 and 1285. It is said to have been incorporated by Elizabeth, as the corporation seal dates from 1570, but no Elizabethan charter can be found. It was incorporated by grant of Charles I. in 1642, and Charles II. gave a charter in 1683. Chard was a mesne borough, the first lord over Bishop Joceline, whose successors held it (with a brief interval from 1545 to 1552) until 1801, when it was sold to Earl Poulett. Parliamentary representation began in 1312, and was lost in 1328. A market on Monday and fair on the 25th of July were granted in 1253, and confirmed in 1642 and 1683, when two more fair days were added (November 2 and May 3), the market being changed to Tuesday. The market day is now Monday, fairs being held on the first Wednesday in May, August and November, for corn and cattle only, their medieval importance as centres of the cloth trade having departed.

CHARDIN, JEAN SIMÉON (1699–1779), French genre painter, was born in Paris, and studied under Pierre Jacques Cazes (1676–1754), the historical painter, and Noël Nicolas Coypel. He became famous for his still-life pictures and domestic interiors, which are well represented at the Louvre, and for figure-painting, as in his Le Bénédicité (1740).

CHARDIN, SIR JOHN (1643–1713). French traveller, was born at Paris in 1643. His father, a wealthy jeweller, gave him an excellent education, and trained him in his own art, but instead of settling down in the ordinary routine of the craft, he set out in company with a Lyons merchant named Raisin in 1665 for Persia and India, partly on business and partly to gratify his own inclination. After a highly successful journey, during which he had received the patronage of Shah Abbas II. of Persia, he returned to France in 1670, and there published in the following year Récit du Couronnement du roi de Perse Soliman III. Finding, however, that his Protestant profession cut him off from all hope of honours or advancement in his native country, he set out again for Persia in August 1671. The second journey was much more adventurous than the first; as instead of going directly to his destination, he passed by Smyrna, Constantinople, the Crimea, Caucasia, Mingrelia and Georgia, and did not reach Isphahan till June 1673. After four years spent in researches throughout Persia, he again visited India, and returned to Europe by the Cape of Good Hope in 1677. The persecution of Protestants in France led him, in 1681, to settle in London, where he was appointed jeweller to the court, and received from Charles II. the honour of knighthood. In 1683 he was sent to Holland as representative of the English East India Company; and in 1686 he published the first part of his great narrative—The Travels of Sir John Chardin into Persia and the East Indies, &c. (London). Sir John died in London in 1713, and was buried in Westminster Abbey, where his monument bears the inscription Nomen simi facit eundo.

It was not till 1711 that the complete account of Chardin's travels appeared, under the title of Journal du voyage du chevalier Chardin, at Amsterdam. The Persian portion is to be found in vol. ii. of Harris's Collection, and extracts are reprinted by Pinkerton in vol. ix. The best complete reprint is by Langlès (Paris, 1811). Sir John Chardin's narrative has received the highest praise from the most comprehensive critics, and has been used as a model for many of the later travels. It is in the highest degree trustworthy; and it furnished Montesquieu, Rousseau, Gibbon and Helvétius with most important material.

CHARENTE, an inland department of south-western France, comprehending the ancient province of Angoumois, and inconsiderable portions of Saintonge, Poitou, Marche, Limousin and Périgord. It is bounded N. by the departments of Deux-Sèvres and Vienne, E. by those of Vienne and Dordogne, S. by Dordogne and W. by Charente-Inférieure. Area 2305 sq. m. Pop. (1906) 351,733. The department, though it contains no high altitudes, is for the most part of a hilly nature. The highest points, many of which exceed 1000 ft., are found in the Confolentais, the granite region of the extreme north-east, known also as the Terres Froides. In the Terres Chaudes, under which name the remainder of the department is included, the levels vary generally between 300 and 500 ft., except in the west—Pays-Bas and Champagne—where they range from 40 to 300 ft. A large part of Charente is thickly wooded, the principal forests lying in its northern districts. The department, as its name indicates, belongs mainly to the basin of the river Charente (area of basin 3860 sq. m; length of river 222 m), the chief affluent of which, within its borders, are the Tardoire, the Touvre and the Né. The Confolentais is watered by the Vienne, a tributary of the Loire, while the arrondissement of Barbezieux in the south-west belongs almost wholly to the basin of the Gironde.

The climate is temperate but moist, the rainfall being highest in the north-east. Agriculturally, Charente is prosperous. More than half its surface is arable land, on the greater part of which cereals are grown. The potato is an important crop. The vine is predominant in the region of Champagne, the wine produced being chiefly distilled into the famous brandy to which the town of Cognac gives its name. The best pastures are found
in the Confolentais, where horned cattle are largely reared. The chief fruits are chestnuts, walnuts, and cider-apples. The poultry raised in the neighbourhood of Barbezieux is highly esteemed. Charante has numerous stone quarries, and there are peat workings and beds of clay which supply brick and tile-works and earthenware manufactories. Among the other industries, paper-making, which has its chief centre at Angoulême, is worthy of note; most of the most important metallurgical establishment is the large foundry of naval guns at Ruelle. Flour-mills and leather-works are numerous. There are also many minor industries subsidiary to paper-making and brandy-distilling, and Angoulême manufactures gunpowder and confectionery. Coal, salt, and timber are prominent imports. Exports include paper, brandy, stone and agricultural products. The department is served chiefly by the Orléans and Ouest-Est railways, and the Charante is navigable below Angoulême. Charante is divided into the five arrondissements of Angoulême, Cognac, Ruffec, Barbezieux, and Confolens (29 cantons, 426 communes). It belongs to the region of the XI. army corps, to the province of the archbishop of Bordeaux, and to the académie (educational division) of Poitiers. Its court of appeal is at Bordeaux.

Angoulême (the capital), Cognac, Confolens, Jarnac and La Rochefoucauld (q.v.) are the more noteworthy places in the department. Barbezieux and Ruffec, capitals of arrondissements and agricultural centres, are of little importance. The department abounds in churches of Romanesque architecture, of which those of Bassac, St. Amant-de-Boixe (portions of which are Gothic in style), Plassac and Gensac-la-Pallue may be mentioned. There are remains of a Gothic abbey church at La Couronne, and Roman remains at St. Cybardeaux, Brossac and Chassenon (where there are ruins of the Gallo-Roman town of Cassinomagus).

**Charante-Inférieure** is a maritime department of southwestern France, comprising the old provinces of Saintonge and Aunis, and a small portion of Poitou, and including the islands of Ré, Oleron, Aix and Madame. Area, 2791 sq. m. Pop. (1906) 453,793. It is bounded N. by Vendée, N.E. by Deux-Sèvres, E. by Charante, S.E. by Dordogne, S.W. by Gironde and the estuary of the Gironde, and W. by the Bay of Biscay. Plains and low hills occupy the interior; the coast is flat and marshy, as are the islands (Ré, Aix, Oleron) which lie opposite to it. The department takes its name from the river Charante, which traverses it during the last 61 m. of its course and drains the central region. Its chief tributaries are on the right the Boutonne, on the left the Seugne. The climate is temperate and, except along the coast, healthy. There are several sheltered bays on the coast, and several good harbours, the chief of which are La Rochelle, Rochefort and Tonnay-Charente, the two latter some distance up the Charante. Royan on the north shore of the Gironde is an important watering-place much frequented for its bathing.

The majority of the inhabitants of Charante-Inférieure live by agriculture. The chief products of the arable land are wheat, oats, maize, barley, and the potato. Horse and cattle-raising is carried on and dairying is prosperous. A considerable quantity of wine is produced. The department has a few peat workings, and produces freestone, lime and cement; the salt-marshes of the coast are important sources of mineral wealth. Glass, pottery, bricks and earthenware are prominent industrial products. Ship-building, brandy-distilling, iron-founding and machine construction are also carried on. Oysters and mussels are bred in the neighbourhood of La Rochelle and Marennes, and there are numerous fishing ports along the coast.

The railways traversing the department belong to the Ouest-Est system, except one section of the Paris-Bordeaux line belonging to the Orléans Company. The facilities of the department for internal communication are greatly increased by the number of navigable streams which water it. The Charante, the Sèvre Niortaise, the Boutonne, the Sèvre and the Gironde furnish 142 m. of navigable waterway, to which must be added the 50 m. covered by the canals of the coast.

There are 6 arrondissements (46 cantons, 481 communes), coequal with the towns of La Rochelle, Rochefort, Marennes, Saintes, Jonzac and St. Jean d'Angély—La Rochelle being the chief town of the department. The department forms the diocese of La Rochelle, and is attached to the 17th military district, and in educational matters to the académie of Poitiers. Its court of appeal is at Poitiers.

La Rochelle, St. Jean d'Angély, Rochefort and Saintes (q.v.) are the principal towns. Surgères and Aulnay possess fine specimens of the numerous Romanesque churches. Pons has a graceful château of the 15th and 16th centuries, beside which there rises a fine keep of the 12th century.

**Charanton-le-Pont**, a town of northern France in the department of Seine, situated on the right bank of the Marne, at its confluence with the Seine, 1 m. S.E. of the fortifications of Paris, of which it is a suburb. Pop. (1906) 18,934. It derives the distinctive part of its name from the stone bridge of ten arches which crosses the Marne and unites the town with Allerton, well known for its veterinary school founded in 1766. It has always been regarded as a point of great importance for the defence of the capital, and has frequently been the scene of sanguinary conflicts. The fort of Charanton on the left bank of the Marne is one of the older forts of the Paris defence. In the 16th and 17th centuries Charanton was the scene of the ecclesiastical councils of the Protestant party, which had its principal church in the town. At St. Maurice adjoining Charanton is the famous Hospice de Charanton, a lunatic asylum, the foundation of which dates from 1641. Till the time of the Revolution it was used as a general hospital, and even as a prison, but from 1802 onwards it was specially appropriated to the treatment of lunacy. St. Maurice has two other national establishments, one for the victims of accidents in Paris (asile national de Vincennes), the other for convalescent working-men (asile national de Vincennes). Charanton has a port on the Canal de St. Maurice, beside the Marne, and carries on boat-building and the manufacture of tiles and porcelain.

**Chares**, Athenian general, is first heard of in 356 B.C. as assisting the Phocians, who had been attacked by Arcos and Sicyon. In 361 he visited Corcyra, where he helped the oligarchs to expel the democrats, a policy which led to the subsequent defection of the island from Athens. In 357, Chares was appointed to the command in the Social War, together with Chabrias, after whose death before Chios he was associated with Ishocrates and Timotheus (for the naval battle in the Hellespont, see TIMOTHEUS). Chares, having successfully thrown the blame for the defeat on his colleagues, was left sole commander, but receiving no supplies from Athens, took upon himself to join the revolted satrap Artabazus. A complaint from the Persian king, who threatened to send three hundred ships to the assistance of the confederates, led to the conclusion of peace (355) between Athens and her revolted allies, and the recall of Chares. In 349, he was sent to the assistance of Olynthus (q.v.) against Philip II. of Macedon, but returned without having effected anything; in the following year, when he reached Olynthus, he found it already in the hands of Philip. In 340 he was appointed to the command of the allies of Thessaly, and fought Byzantium against Philip, but the inhabitants, remembering his former plunderings and extortions, refused to receive him. In 338 he was defeated by Philip at Amphissa, and was one of the commanders at the disastrous battle of Chaeronea. Lysicles, one of his colleagues, was condemned to death, while Chares does not seem to have been even accused. After the conquest of Thebes by Alexander (335), Chares is said to have been one of the Athenian orators and generals whose surrender was demanded. Two years later he was living at Sigeum, for Arrian (Anabasis i. 12) states that he went from there to pay his respects to Alexander. In 332 he entered the service of Darius and took over the command of a Persian force in Mytilene, but capitulated on the approach of a Macedonian fleet on condition of being allowed to retire unmolested. He is last heard of at Taenarum, and is supposed to have died at Sigeum. Although boastful and vain-glorious, Chares was not lacking in personal courage, and was among the best Athenian generals.
of his time. At the best, however, he was "hardly more than an ordinary leader of mercenaries" (A. Holm). He openly boasted of his profligacy, was exceedingly avaricious, and his bad faith became proverbial.

Diod. Sic. xvi. 75, 95, xvi. 7, 21, 22, 85-88; Plutarch, Phocion, 14; Theopompus, ap. Athenaeum, xi. p. 532; A. Schäfer, Demostenes und seine Zeit (1885); A. Holm, History of Greece (Eng. trans., 1896), vol. iii.

CHARES, of Lindus in Rhodes, a noted sculptor, who fashioned for the Rhodians a colossal brass statue of the sun-god, the cost of which was defrayed by selling the warlike engines left behind by Demetrius Poliorcetes, when he abandoned the siege of the city in 303 B.C. (Pliny, Nat. Hist. xiv. 41). The colossus was seventy cubits (105 ft.) in height; and its fingers were larger than many statues. The notion that the legs were planted apart, so that ships could sail between them, is absurd. The statue was thrown down by an earthquake after 50 years; but the remains lay for ages on the spot.

CHARIES, of Mytilene, a Greek belonging to the suite of Alexander the Great. He was appointed court-marshall to introduce the stranger to the king, an office borrowed from the Persian court. He wrote a history of Alexander in ten books, dealing mainly with the private life of the king. The fragments are chiefly preserved in Athenaeus.

See Scriptores Rerum Alexandri (pp. 114-120) in the Didot edition of Arrian.

CHARGE (through the Fr. from the Late Lat. carriare, to load in a carrus or wagon; cf. "cargo"), a load; from this, its primary meaning, also seen in the word "charger," a large dish, come the uses of the word for the powder and shot to load a fire-arm, the accumulation of electricity in a battery, the necessary quantity of dynamite or other explosive in blasting, and a device borne on an escutcheon in heraldry. "Charge" can thus mean a burden, and so a care or duty laid upon one, as in "to be in charge" of another. With a transference to that which lays such a duty on another, "charge" is used of the instructions given by a judge to a jury, or by a bishop to the clergy of his diocese. In the special sense of a pecuniary burden the word is used of the price of goods, of an encumbrance on property, and of the expenses of running a business. Further uses of the word are of the violent, rushing attack of cavalry, or of a bull or elephant, or football player; hence "charger" is a horse ridden in a charge, or more loosely a horse ridden by an officer, whether of infantry or cavalry.

CHARGÉ D'AFFAIRES (Fr. for "in charge of business"), the title of two classes of diplomatic agents. (1) Chargés d'affaires (ministres chargés d'affaires), who were placed by the règlement of the congress of Vienna in the 4th class of diplomatic agents, are heads of permanent missions accredited to countries to which, for some reason, it is not possible or not desirable to send agents of a higher rank. They are distinguished from these latter by the fact that their credentials are addressed by the minister for foreign affairs of the state which they are to represent to the minister for foreign affairs of the receiving state. Though still occasionally accredited, ministers of this class are now rare. They have precedence over the other class of chargés d'affaires. (2) Chargés d'affaires per interim, or chargés d'affaires, are those who are presented as such, either verbally or in writing, by heads of missions of the first, second or third rank to the minister for foreign affairs of the state to which they are accredited, when they leave their post temporarily, or pending the arrival of their successor. It is usual to appoint a counsellor or secretary of legation chargé d'affaires. Some governments are accustomed to give the title of minister to such chargés d'affaires, which ranks them with the other heads of legation. Essentially chargés d'affaires do not differ from ambassadors, envoys or ministers resident. They represent their nation, and enjoy the same privileges and immunities as other diplomatic agents (see Diplomacy).

CHARGING ORDER, in English law, an order obtained from a court or judge by a judgment creditor under the Judgment Acts 1838 and 1840, by which the property of the judgment debtor in any stocks or funds stands charged with the payment of the amount for which judgment shall have been recovered, with interest. A charging order can only be obtained in respect of an ascertained sum, but this would include a sum ordered to be paid at a future date. An order can be made on stock standing in the name of a trustee in trust for the judgment debtor, or, on cash in court to the credit of the judgment debtor, but not on stock held by a debtor as a trustee. The application for a charging order is usually made by motion to a divisional court, though it may be made to a judge. The effect of the order is that of a contract to pay the debt, but merely of an instrument of charge on the shares, signed by the debtor. An interval of six months must elapse before any proceedings are taken to enforce the charge, but, if necessary, a stop order on the fund and the dividends payable by the debtor can be obtained by the creditor to protect his interest. A solicitor employed to prosecute any suit, matter or proceeding in any court, is entitled, on declaration of the court, to a charge for his costs upon the property recovered or preserved in such suit or proceeding. (See Rules of the Supreme Court, 0. XIX.)

CHARIBERT (d. 567), king of the Franks, was the son of Chlotar I. On Chlotar's death in 561 his estates were divided between his sons, Charibert receiving Paris as his capital, together with Rouen, Tours, Poitiers, Limoges, Bordeaux and Toulouse. Besides his wife, Ingelsea, he had unions with Merodela, a wool-carder's daughter, and Theodogilda, the daughter of a neatherd. He was one of the most dissolve of the Merovingian kings, his early death in 567 being brought on by his excesses.

CHARIDEMUS, of Oreus in Euboa, Greek mercenary leader. About 367 B.C. he fought under the Athenian general Iphicrates against Amphipolis. Being ordered by Iphicrates to take the Amphilopolitan hostages to Athens, he allowed them to return to their own people, and joined Cotys, king of Thrace, against Athens. Soon afterwards he fell into the hands of the Athenians and accepted the offer of Timotheus to re-enter their service. Having been dismissed by Timotheus (562) he joined the revolted satraps Memnon and Mentor in Asia, but soon lost their confidence, and was driven to seek the protection of the Athenians. Finding, however, that he had nothing to fear from the Persians, he again joined Cotys, on whose murder he was appointed guardian to his youthful son Cersobleptes. In 357, on the arrival of Chares with considerable forces, the Chersonese was restored to Athens. The supporters of Charidemus represented this as due to his efforts, and, in spite of the opposition of Demosthenes, he was honoured with a golden crown and the franchise of the city. It was further resolved that his person should be inviolable. In 351 he commanded the Athenian forces in the Chersonese against Philip II. of Macedon, and in 349 he superseded Chares as commander in the Olympanic War. He achieved little success, but made himself detested by his insolence and profligacy, and was in turn replaced by Chares. After Chaeroneia the war party would have entrusted Charidemus with the command against Philip, but the peace party secured the appointment of Phocion. He was one of those whose surrender was demanded by Alexander the Great, but Chares refused to surrender his friend, as he was anxious to avoid the disgrace of surrendering a great general. He fled to Darius III., who received him with distinction, but, having expressed his dissatisfaction with the preparations made by the king just before the battle of Issus (333), he was put to death.

See Diod. Sic. xvii. 30; Plutarch, Phocion, 16, 17; Arrian, Anabasis, i. 10; Quintus Curtius iii. 2; Demosthenes, Contra Aristocraetam; A. Schäfer, Demostenes und seine Zeit (1885).

CHARING CROSS, the locality about the west end of the Strand and the north end of Whitehall, on the south-east side of Trafalgar Square, London, England. It falls within the bounds of the city of Westminster. Here Edward I. erected the last of the series of crosses to the memory of his queen, Eleanor (d. 1290). It stood near the present entrance to Charing

According to some authorities, this is a second Charidemus, the first disappearing from history after being superseded by Chares in the Olympanic war.
Cross station of the South-Eastern & Chatham railway, in the
courtyard of which a fine modern coach has been erected in a
few feet of the exact site. A popular derivation of the name
connected it with Edward’s “dear queen” (chère reine), and a
village of Cherringe or Charing grew up here later, but the true
origin of the name is not known. There is a village of Charing
in Kent, and the name is connected by some with that of a
Saxon family, Cerring.

CHARIOT—(derived from an O. Fr. word, formed from char, a
car), in antiquity, a conveyance (Gr. ἄγα, Lat. currus) used in
battle, for the chase, in public processions and in games. The
Greek chariot had two wheels, and was made to be drawn by two
horses; if a third or, more commonly, two reserve horses were
added, they were attached on each side of the main pair by a
single trace fastened to the front of the chariot, as may be seen
on two prize vases in the British Museum from the Panatheniac
games at Athens. On the monuments there is no other sign of
traces, from the want of which wheeling round must have been
difficult. Immediately on the axle (ξυα, axis), without springs
of any kind, rested the basket or body (βήθρος) of the chariot,
with the horse’s feet raised above it. A semicircular guard
round the front about half the height of the driver was
entirely open at the back, so that the combatant might readily
leap to the ground and up again as was necessary. There was
no seat, and generally only room for the combatant and his charioteer
to stand in. The pole (βυάς, temo) was probably attached to the
middle of the axle, though it appears to spring from the front
of the basket; at the end of the pole was the yoke (γόριον, jugum),
which consisted of two small saddles fitting the necks of the horses,
and fastened by broad bands round the chest. Besides this the
harness of each horse consisted of a bridle and a pair of reins,
mostly the same as in use now, made of leather and ornamented
with studs of ivory or metal. The reins were passed through
rings attached to the collar bands or yoke, and were long enough
to be tied round the waist of the charioteer in case of his having
to defend himself. The wheels and body of the chariot were
usually of wood, strengthened in places with bronze or iron; the
wheels had from four to eight spokes and tires of bronze or iron.
This description applies generally to the chariots of all the nations
of antiquity; the differences consisted chiefly in the mountings.
The chariots of the Egyptians and Assyrians, with whom the
bow was the principal arm of attack, were richly mounted with
quivers full of arrows, while those of the Greeks, whose character-
istic weapon was the spear, were plain except as regards mere
decoration. Among the Persians, again, and more remarkably
among the ancient Britons, there was a class of chariot having
the wheels mounted with sharp, sickle-shaped blades, which cut
to pieces whatever came in their way. This was probably an
invention of the Persians; Cyrus the younger employed these
chariots in large numbers. Among the Greeks and Romans, on
the other hand, the chariot had passed out of use in war before
historic times, and was retained only for races in the public
games, or for processions, without undergoing any alteration
apparently, its form continuing to correspond with the descrip-
tion of Homer, though it was lighter in build, having to carry
only the charioteer. On two Panatheniac prize vases in the
British Museum are figures of racing bigae, in which, contrary
to the description given above, the charioteer was depicted with
his feet resting on a board hanging down in front close to the legs of
his horses. The biga itself consists of a seat resting on the axle, with
a rail at each side to protect the driver from the wheels. The
chariot was unsuited to the uneven soil of Greece and Italy, and
it is not improbable that these nations had brought it with them
as part of their original habits from their former seats in the
East. In the remains of Egyptian and Assyrian art there are
numerous representations of chariots, from which it may be
seen with what richness they were sometimes ornamented. The
“iron” chariots in use among the Jews appear to have been
chariots strengthened or plated with metal, and no doubt were
of the form above described, which prevailed generally among
the other ancient nations. (See also CARRIAGE.)

CHARISIUS, FLAVIUS SOSPATER, Latin grammarian,
flourished about the middle of the 4th century A.D. He was
probably an African by birth, summoned to Constantinople
to take the place of Eunapius, a learned commentator on Terence.
The Ars Grammatica of Charisius, in five books, addressed to his
son (not a Roman, as the preface shows), has come down to us
in a mutilated condition, the beginning of the first, part of the
fourth, and the greater part of the fifth book having been lost.
The work, which is merely a compilation, is valuable as containing
excerpts from the earlier writers on grammar, who are in
many cases mentioned by name—Q. Remmius Palaemon, C.
Julius Romanus, Cominius.

The best edition is by H. Kell, Grammatica Latini, i. (1857); see
also articles by G. Geitz in Pauly-Wissowa’s Realencyclopädie, iii. 2
(1892); Teuffel-Schwake, H. J. of Roman Literature (Eng. trans.,
§419, 1. 2; Frohde, in Jahrh. für Philol., 18 Suppl. (1892), 567–672.

CHARITON, of Aphrodisias in Caria, the author of a Greek
romance entitled The Loves of Chaeares and Callirrhoe, probably
flourished in the 4th century A.D. The action of the story,
which is to a certain extent historical, takes place during the
time of the Peloponnesian War. Opinions differ as to the merits
of the romance, which is an imitation of Xenophon of Ephesus
and Heliodorus.

Editions by J. P. D’Orville (1873), G. A. Hirschig (1886) and
R. Hercher (1899); there is an (anonymous) English translation
(1767); also E. der Laage, Beiträge zur Roman (1900).

CHARITY AND CHARITIES. The word “charity,” or love,
represents the principle of the good life. It stands for a mood
or habit of mind and an endeavour. From it, as a habit of mind,
springs the social and personal endeavour which in the widest
sense we may call charity. The two correspond. Where the
habit of mind has not been gained, the endeavour fluctuates
and is relatively purposeless. In so far as it has been gained,
the endeavour is founded on an intelligent scrutiny of social
conditions and guided by a definite purpose. In the one case
it is realized that some social theory must be found by us, if
our action is to be right and consistent; in the other case no
need of such a theory is felt. This article is based on the assump-
tion that there are principles in charity or charitable work, and
that these can be ascertained by a study of the development of
social conditions, and their relation to prevalent social aims
and religious or philosophic conceptions. It is assumed also
that the charity of the religious life, if rightly understood,
cannot be inconsistent with that of the social life.

It is the same close gift which is due and necessary. The words
that signify goodwill towards the community and its members
are primarily words expressive of the affections of family life in
the relations existing between parents, and between parent and
child. As will be seen, the analogies underlying such phrases as “God
the Father,” “children of God,” “the Church” are strong. To a great
extent the development of charitable thought in pre-Christian as well
as in Christian days. The germ, if we may say so, of the words
charitas, caritas, amor, love; amicitia, friendship, is the social or the
Christian. The friendship of the larger life in men in the
meaning of the word expands. Caritas, or charity, strikes another
note—high price, and thus dearness. It is charity, indeed, expressed
in mercantile metaphor; and it would seem that it was associated
in the mind with the word gnos, which has also a commercial mean-
ing, but signifies as well favour, gratitude, grace, kindness. Parth
thus, perhaps, it assumed and suggested a nobler conception; and
sometimes, as, for instance, in English ecclesiastical documents, it
was translated “charity.” In the Graeco-Latin Bible, translated
by St Paul as a translation of the Hebrew word ἀγάπη, which in the Old Testament is in the same
version translated mercy “—as in Hosea vi. 6, ‘I desired mercy, and not sacrifice; and the knowledge of God more than burnt
offering and sin-offering, righteousness and truth, and
kindness and goodness, as distinguished from almsgiving. Almsgiving,
ζησεία, is translated by the word δόματων in the Septuagint, and
in the Authorized Version by the word “righteousness.” It re-
presents in the same close gift as is due and necessary, but not
spontaneously, but under a sense of religious obligation. In the earlier
Christian period the word almsgiving has this meaning, and was
in that sense applied to a wide range of actions and contracts, from
a gift to a beggar at a church door to a grant and a tenure of land.

It also, in the word almoner, represented the fulfillment of the religious obligation with the aid of an agent or delegate. The words charity or love (caritas or 4 ykx), on the other hand, without losing the tone with which the thought of parental or family love inspires them, assume here a higher, colder, religious thought. They imply an ideal life, as represented by such expressions as "love (agape) of God." This on the one side; and on the other an ideal social relation, in such words as "love of man." Thus in the word "charity," the social and religious thought, and this regard the word means a disciplined and habitual mood in which the mind is considerate of the welfare of others individually and generally, and devises what is for their real good, and in which the intelligence and the will strive to further the growth of such and such a character. Charity, however, is not an essential part of charity or charitable work. It is one of many means at its disposal. If the world were so poor that no one could make a gift, or so wealthy that no one needed it, charity—the charity of life and of deeds—would remain.

The history of charity is a history of many social and religious theories, influences and endeavors, that have left their mark alike upon the popular and the cultivated thought of the present day. The inconsistencies of charitable effort and argument may thus in part be accounted for. To understand the problem of charity we have therefore (1) to consider the stages of charitable thought—the primitive, pagan, Greek and Roman, Jewish and Christian elements, that make up the modern elements of class and class in regard to charity, and also the growth of the habit of "charity" as representing a gradually evoluted social instinct. (2) We have also to consider in their relation to charity the results of the various investigations of the conditions of social life. (3) At each stage we have to note the corresponding stage of practical administration in public relief and private effort—for the division between public or "poor-law" relief and charity which prevails in England is, comparatively speaking, a novelty, and, generally speaking, the work of charity can hardly be appreciated or understood if it be considered without reference to public relief. (4) As to the present day, we have to consider practical suggestions in regard to such subjects as charity and economic thought, charity organization, friendly visiting and almoners, co-operation with the poor-law, charity and thrift, parochial management, hospitals and medical relief, exceptional distress and the "unemployed," the utilization of endowments and their supervision, and their adaptation to new needs and emergencies. (5) We have also throughout to consider charitable help in relation to classes of dependants, whether appear early in the history of the question—widows and orphans, the sick and the aged, vagrants and wayfarers.

First in the series come the charities of the family and of hospitality; then the wider charities of religion, the charities of the community, and of individual donors and of mutual help. These generally assumed importance in communities which consisted originally of self-supporting classes, within which widows and orphans, for instance, would be rather provided for, in accordance with recognized class obligations, than relieved. Then comes habitual almsgiving, the charitable endowment, and the modern charitable institution and association. But throughout the test of progress or decadence appears to be the condition of the family. The family is the source, the home and the heartstone of charity. It has been created but slowly, and there is naturally a constant tendency to break away from its obligations and to ignore and deprecate its utility. Yet the family, as we now have it, is itself the outcome of infinite thought working through social instinct, and has at each stage of its development indicated a general advance. To it, therefore, constant reference must be made.

PART I.—PRIMITIVE CHARITY

The study of early communities has brought to light the history of the development of the family. "Marriage in its lowest phases is by no means a matter of affection or companionship"; and only very slowly has the position of both parents been recognized as implying different but correlative responsibilities towards their child. Only very slowly, also, has the morality necessary to the making of the family been won. Charity at earlier stages is hardly recognized as a virtue, nor infanticide as at first. Hospitality—the beginning of a larger social life—is non-existent. The self-support of the community is secured by marriage, and when relations fail marriage becomes a provision against poverty. Then by the tribal system is created another safeguard against want. But apart also from these methods of maintenance, at a very early stage there is charitable relief. The festivals of the solstices and equinoxes, and of the seasons, are the occasions for sacrifice and relief; and, as Christmas customs prove, the instinct to give help or alms at such festival periods still remains. Charity is concerned primarily with certain elemental forces of social life: the relation between these primitive instincts and impulses that still influence charity should not, therefore, be overlooked. The basis of social life is also the basis of charitable thought and action.

The savage is the civilized man in the rough. "The lowest races have," Lord Avebury writes, "no institution of marriage. Many have no word for dear" or "beloved." The child belongs to the tribe rather than to the family. In these, the functions of charity such as the following may arise:—"Am I to starve, while my sister has children whom she can sell?" a question asked of Burton by a negro. From the point of view of the tribe, an able-bodied man with children has a duty to keep them, and the relationship of the larger family of brothers and sisters would be a truer claim to help than that of mother and child. Subsequently the child is recognized as related, not to the father, but to the group by blood and marriage. The child is separated between mother and child, although the father is a stranger to it." Slowly only is the relative position of both parents, with different but correlative responsibilities, recognized. The first two steps of charity have the same function of bringing the separation between the father and the mother; then between the father, and the child has been recognized. Until this point is reached the morality necessary to the making of the family is wanting, and for a long time afterwards it is hardly won. The virtue of charity thus becomes essential to the larger family. On the other hand, marriage. Indeed, the set of such religious thought as there may be is against it. Abstract conceptions, even in the nobler races, are lacking. The religion of life is vaguely struggling with its animality, and that which it at last learns to rule is the most powerful and the least worthy. In these circumstances there is little charity for the child and little for the stranger. "There is," Dr Schwein- furt wrote in his "Heart of Africa," "an utter want of wholesome intercourse between race and race. For any member of a tribe that spears a stranger he can be considered as a man; and another who is more polite in his ways is made to venture at the hazard of his life." The religious obligations that fostered and sanctified family life among the Greeks and Romans and Jews are unknown. Much later in development comes charity to the child. The child and its parents have been alternately searched and preserved against the Jewish-Christian charity of 2000 years ago uttered its most vigorous protests. If the child belonged primarily to the tribe or state, its maintenance or destruction was a common concern. This motive influenced the Greeks who would rather the barbarians form such partnerships as can. For the common good they exposed the deformed child; but also "where there were too many, in our state population has a limit," as Aristotle says, "the babe or unbom child was destroyed. And so, to lighten their own responsibilities, they were wont to do in the years of the degradation of the Roman empire, though the interest of the state then required a contrary policy. The transition to our present feeling of responsibility for child-life has been very gradual and unnoticeable though it grew through the ages. The evil became a great concern, and, as the 19th century advanced, the care for welfare of regard for child-life, when the rearing of children becomes a source of economic pressure, suggests why in earlier stages of civilization all that charitable apparatus which we now think necessary for the assistance of children was wanting, even if it does arise, is not adequately met by the recognized obligations of the clan-family or brotherhood.

In the case of barbarous races charity and self-support may be considered from some other points of view. We are opposed in ways—spiritual and physical—of the opposite. Charity thus becomes a provision for poverty when relations fail. The clan-family may serve the same purpose. David Livingston describes the formation of the clan-family among the Bakungu. Each man, by virtue of paternity, is called to do in the house. They build huts round his...
called a 'kotla,' with a fireplace; here they work, eat, &c. A poor man attaches himself to the 'kotla' of a rich one, and is considered a child of the latter.' Thus the clan-family is also a poor-relief association.

Studies in folklore bring to light many relations between the charity of the old world and that of our own day.

In regard to the charity of the early community, we may take the 8th century B.C. as the point of departure. The Odyssey (about 800 B.C.) and Hesiod (about 700 B.C.) are roughly parallel with Amos (816-775), and represent two streams of thought that meet in the early Christian period. The period covered by the Odyssey seems to merge into that of Hesiod. We take the former first, dealing with the clan-family and the phratry, which are together the self-maintaining unit of society, with the general relief of the poor, with hospitality, and with vagrancy. In Hesiod we find the customary law of charity in the earlier community definitely stated, and also indications of the normal methods of neighbourly help which were in force in country districts.

The early community.

First of the family and brotherhood, or phratry. The family (Od. viii. 582) was composed alike of the wife's father and of her husband. It was thus a clan-like family. Out of this we developed the phratry or brotherhood in which were included all alike noble families, peasants and craftsmen, united by a common worship and responsibilities and a common customary law (themis). Zeus, the god of social life, was worshipped by the phratry. He was the father of the law (Themis). He was god of host and guest. Society was thus based on law, the brotherhood and the family. The irresponsible man, the man worthy of no respect or consideration, was one who belonged to no brotherhood, was subject to no customary law, and had no hearth or family. The phratry was, and became afterwards still more, 'a natural guild.' Outside the self-sustaining phratry was the stranger, including the wayfarer and the vagrant; and partly merged in these classes was the beggar, the recognized recipient of the alms of the community. To change one's abode and to travel was assumed to be a cause of reproach (II. ix. 648). The 'land-louper' was naturally suspected. On the other hand, a stranger's first thought in a new country was whether the inhabitants were wild or social (bhaSau), hospitable and God-fearing (Od. xiii. 201). Hospitality thus became the first public charity; Zeus sent all strangers and beggars, and it was against all law (bhaMy) to slight them. Out of this feeling grew a kind of glorified almsgiving—grew up the system of hospitality in Greek states and also in the Roman world. The host greeted the stranger (or the suppliant). An oath of friendship was taken by the stranger, who was then received with the greeting, Welcome (yAziPe), and water was provided for ablation, and food and shelter. In the larger house there was a guests' table. In the hut he shared the peasant's meal. The custom hound alike the rich and the poor. On parting presents were given, usually food for the onward journey, sometimes costly gifts. The obligation was mutual, that the host should give hospitality, and that the guest should not abuse it. From early times tallies were exchanged between them as evidence of this formal relationship, which each could claim again of the other by the production of the token. And further, the relationship on either side became hereditary. Thus individuals and families and tribes remained linked in friendship and in the interchange of hospitality.

Under the same patronage of Zeus and the same laws of hospitality were vagrants and beggars. The vagrant and loafer are sketched in the Odyssey—the vagrant who lies gibbly that he may get entertainment, and the loafer who prefers begging to work on a farm. These and the wanderers—(a group known to modern life)—prefer at that season to spend their time in the warmth of the village smithy, or at a house of common resort (MorXa)—a common lodging-house, we might say—where they would pass the night. Apparently, as in modern times, the vagrants had organized their own system of entertainment, and, supported by the public, were a class for whom it was worth while to cater. The local or public beggars formed a still more definite class. Their begging was a recognized means of maintenance; it was a part of the method of poor relief. Thus of Penelope it was said that, if Odysseus' tale were true, she would give him better clothes, and then he might beg his bread throughout the country-side. Feasts, too, and almsgiving were nearly allied, and feasts have always been one resource for the relief of the poor. Thus naturally the beggars frequented feasts, and were apparently a recognized and yet inevitable nuisance. They wore, as part of their dress, scrips or wallets in which they carried away the food they received, as later Roman clients carried away portions of food in baskets (sportula) from their patron's dinner. Odysseus, when he dresses up as a beggar, puts on a wallet as part of his costume. Thus we find a system of voluntary relief in force based on a recognition of the duty of almsgiving as complete and peremptory as that which we shall notice later among the Jews and the early Christians. We are concerned with country districts, and not with towns, and, as social conditions that are similar produce similar methods of administration, so we find here a general plan of relief similar to that which was in vogue in Scotland till the Scottish Poor Law Act of 1845.

In Hesiod the fundamental conceptions of charity are more clearly expressed. He has, if not his ten, at least his four commandments, for disobedience to which Zeus will punish the offender. They are: Thou shalt do no evil to suppliant or guest; thou shalt not dishonour any woman of the family; thou shalt not fight against the orphan; thou shalt not be unkind to aged parents.

The laws of social life are thus duty to one's guest and duty to one's family; and charity has its true true place in that relation, as the later Greeks, who so often quote Hesiod (cf. the so-called Economics of Aristotle), fully realized. Also the family charities due to the orphan, whose lot is deplored in the Iliad (xiii. 499), and to the aged are clearly mentioned. But there is also in Hesiod the duty to one's neighbour, not according to the "perfection" of "Cristes fore," but according to a law of honourable reciprocity in act and intent. "Love him who loves thee, and cleave to him who will give, giveth, and not would not have given, give not." The great work of Hesiod's charities consists in the neighbourhood's help (such as formed no small part of old Scottish charity in the country districts); and he put his argument thus: "Competition, which is a kind of strife, "lies in the roots of the word, and grows warnen." It is good, and rouses the idle "handless" man to work. On one side are social duty (bcin) and work, done briskly at the right season of the year, which brings a full barn. On the other side are unthrift and hunger, and relief with the disgrace of begging; and the right to which the stranger has a claim or right to ask from his neighbours, to whose house the beggar has to go with his wife and children to ask for victual. Once they may be helped, or twice, and then they will be refused. It is better, Hesiod tells his brother, to take clothes and pay for them, or to ask gifts, (sportula) &c, and elsewhere). Here indeed is a problem of to-day as it appeared to an early Greek. The alternatives before the idler—so far as his own community is concerned—are labour with neighbourly help to a limited extent, or hunger.

Hesiod was a farmer in Boeotia. Some 530 years afterwards a pupil of Aristotle thus describes the district and its community of farmers. "They are," he says, "well to do, but simple in their way of life. They practise justice, good faith, and hospitality. To needy townsmen and vagabonds they give freely of their sustenance; for meanness and covetousness are unknown to them." The charitable method of Homeric and Hesiodic days still continued.

PART II.—CHARITY AMONG THE GREEKS

Society in a Greek state was divided into two parts, citizens and slaves. The citizens required leisure for education, war and government. The slaves were their ministers and servants to enable them to secure this leisure. We have therefore to divide our account into two parts, the provision of the family and the clan-family, and the maintenance of the citizen from public funds and by public and private charities; and on the other hand the condition of the slaves, and the relation between slavery and charity.

The slaves formed the larger part of the population. The census of Attica, made between 317 and 307 B.C., gives their numbers at 400,000 out of a population of about 500,000; and even if this be considered excessive, the proportion of slaves to citizens would certainly be very large. The citizens with their wives and children formed some 12% of the community. Thus, apart from the resident aliens, returned in the census at 10,000,
and their wives and children, we have two divisions of society: the citizens, with their own organization of relief and charities; and the slaves, permanently maintained by reason of their dependence on individual members of the civic class. Thus, there is no poverty but that of the poor citizens. Poverty is limited to them. The slaves—that is to say, the bulk of the labouring population—are provided for.

From times relatively near to Hesiod’s we may trace the growth and influence of the clan-family as the centre of customary charity within the community, the gradual increase of a class of poor either outside the clan-family or eventually independent of it, and the development of a new organization of relief introduced by the state to meet newer demands. We picture the early state as a group of families, each of which tends to form in time a separate group or clan. At each expansion from the family to the clan the members of the clan retain rights and have to fulfill duties which are the same as, or similar to, those which prevailed in the family. Thus, in Athens the clan-families (genos) and the brotherhoods (pirateria) were “the only basis of legal rights and obligations over and above the natural family.”

The clan-family was “a natural guild,” consisting of rich and poor members—the well-born or noble and the craftsman alike. Originally it would seem that the land was divided among the families of the clan by lot and was inalienable. Thus with the family was combined the means of supporting the family. On the other hand, every youth was registered in his phratry, and the phratry remained till the reforms of Cleisthenes (500 B.C.) a political, and even after that time a social, organization of importance.

First, as to the family—the mother and wife, and the father. Already before the age of Plato and Xenophon (450–350 B.C.) we find that the family has suffered a slow decline. The wife, according to later Greek usage, was married as a child, hardly educated, and confined to the house, except at some festival or funeral. But with the decline came criticism and a nobler conception of family life. “First, then, come laws regarding the wife,” writes the author of the so-called Economics of Aristotle, and the law, “I shall do no wrong; for, if we do no wrong, we shall not be wronged.” This is the “common law,” as the Pythagoreans say, “and it implies that we must not wrong the wife in the least, but treat her with the reverence due to a suppliant, or one taken from the altar.” The sanctity of marriage is thus placed among the “commandments” of Hesiod, beside the duty towards the stranger and the orphan. These and other references to the Pythagoreans suggest they that, possibly in common with other mystics, preached the higher religion of marriage and social life, and thus inspired a deeper social feeling, which eventually allied itself with the Christian movement.

Next, as to parents and children: the son was under an obligation to support his father, subject, after Solon’s time, to the condition that he had taught him a trade; and after Solon’s time the father had no claim for support from an illegitimate son. “The possession of children,” it was said (Arist. Econ.), “is not by nature for the public good only, but also for private advantage. For what the strong may gain by their toil for the weak, the weak in their old age receive from the strong. . . . Thus is the nature of each, the man and the woman, prearranged by the Divine Being for a life in common.” Honour to parents is “the first and greatest and oldest of all debts” (Plato, Laws, 717). The child has to care for the parent in his old age. “Nemesis, the minister of justice (biê), is appointed to watch over all these things.” And “if a man fail to adorn the sepulchre of his dead parents, the magistrates take note of it and inquire” (Xen. Mem. ii. 14). The heightened conception of marriage implied a full recognition of the mutual relations of parent and child as well, both became sacred.

Then as to orphans. Before Solon’s time (594 B.C.) the property of any member of the clan-family who died without children went to the clan; and after his time, when citizens were permitted to leave their property by will, the property of an intestate fell to the clan. This arrangement carried with it corresponding duties. Through the clan-family provision was made for orphans.

Any member of the clan had the legal right to claim an orphan member in marriage; and, if the nearest agnate did not marry her, he had to give her a dowry proportionate to the amount of his own property. Later, there is evidence of a growing sense of responsibility in regard to orphans. Hippodamus (about 443 B.C.), in his scheme of the perfected state (Arist. Pol. 1268), suggested that there should be public magistrates to deal with the affairs of orphans (and strangers); and Plato, his contemporary, writes of the duty of the state and of the guardian towards them very fully. Orphans, he proposes (Laws, 927), should be placed under the care of public guardians. “Men should have a fear of the loneliness of orphans. . . . and of the souls of the departed, who by nature take a special care of their own children. . . . A man should love the unfortunate orphan (boy or girl) of whom he is guardian as if he were his own child; he should be as careful and diligent in the management of the orphan’s property as of his own or even more careful still.”

To relieve the poverty of the state and of the clan, the citizenship—objects of public policy and of charity. In Crete and Sparta the citizens were wholly supported out of the public resources. In Attica the system was different. The citizens were aided in various ways, in which, as often happens, legal or official and voluntary or private methods worked on parallel lines. The means were (1) legal enactment for release of debts; (2) emigration; (3) the supply of corn; (4) poor relief for the infirm, and relief for the children of those fallen in war; (5) emoluments; (6) voluntary public service, separate gifts and liberality; (7) loan societies.

(1) In 594 B.C. the labouring class in Attica were overwhelmed with debts and mortgages, and their persons pledged as security. Only by a sharp reform was it possible to preserve them from slavery. This was Solon’s. He abrogated the franchise of the person, and gave the labourers the franchise (but see under Solon). Besides the laws above mentioned, he gave power to the Areopagus to inquire from what sources citizens obtained their wealth, and which those who did not work. His action and that of his successor, Pisostratus (560 B.C.), suggest that the class of poor (sôpetes) was increasing, and that by the efforts of these two men the social decline of the labouring class was counteracted. He annulled their obligations, and gave the Areopagus the power that they might maintain themselves in husbandry. He wished, it is said (Arist. Ath., Pol. xvi.), to enable them to earn a moderate living, that they might be occupied with their own affairs, instead of spending their time and strength in order to visit it. As rent for their land they paid a tenth of the produce.

(2) Akin to this policy was that of emigration. Athenians, selected in some instances from the two lowest political classes, emigrated, and established colonies in various parts of the world. Salamis was annexed and divided into lots and settled, and later Pericles settled more than 2750 citizens in the Chersonese and elsewhere—practically a considerable section of the whole body of citizens. “By this means,” says Plutarch, “he relieved the state of numerous idle agitators and assisted the necessitous.” In other states this expedient was frequently adopted.

(3) A third method was the supply of corn at reduced rates—a policy which led to the eventual creation of a granary at Athens. At the time of the Peloponnesian War, a gentleman named Nicias added corn at 2 talents per bushel. This view was adopted by Pericles, and the granary was maintained at a reduced price. The price of corn was fixed at 3 talents per bushel, 1/2 of this sum being provided by the state.

(4) In addition to this there was a system of public relief for those who were unable to earn a livelihood on account of bodily defects and old age, amounting to 1/40 of the public property. The public property of the applicant had to be shown to be of a value of not more than three minae (say £12). Socrates, it may be noted, adopts the same method of estimating his comparative poverty (Xen. Econ. 2. 4). The public relief was administered by a trust (perikles), having his gift. The laws for the care of the poor and the aged are to be found in Laws (ch. xvi.), where the writer aimed at an efficient relief of the poor and the aged. The average age of those who benefited was about twenty guineas. The senate determined the case, and the ecclesia awarded the bounty, which amounted to 1 or 2 obols a day, rather more than 13d. or 3d.—out-door relief, as we might say, amounting to 1s. 6d. a week. There was also a fund for the maintenance of the children of those who had fallen in war, up to the age of eighteen.

(5) But the main source of support was the receipt of emoluments for various public services. This was not relief, though it produced a certain measure of relief. It was rather the Athenian method of supporting a governing class of citizens.
The inner political history of Athens is the history of the extension of the franchise to the lower classes of citizens, with the privileges of holding office and receiving emoluments. In early times, either by Solon (q.v.) or previously, the citizens were classified on the basis of property. The rich retained their old rights of holding office; the middle classes obtained the franchise; the fourth or lowest class gained none. By the reforms of Cleisthenes (509 B.C.) the clan-family and the phratry were set aside for the purposes of government. The rich continued to hold office, but none new was added. Finally, about 478 B.C. when all had acquired the franchise, the right to hold office was also obtained by the third class. These changes coincided with a period of economic progress. The rate of interest was high, usually 12%; and in trading and bottomry, the risk was high, but the reward greater. A large sum put into the market at this period often produced comparative wealth; and simultaneously prices were falling. Then came the reaction. After the Peloponnesian war (432-404 B.C.), writes Professor Jebb, the wealth of the country consisted of land, and the landholding classes increased; then came a greater loss, and a still greater decline. It might almost be said, in giving scope to the assertion of the spirit of dependence, had ruined the self-regarding regard on which both family and state alike depended. The emoluments were diverse.

The number of citizens was not large; the functions in which citizens could participate, therefore, were essentially different from what they were in modern democracies. The poorer citizens were pressed in to exercise their rights (cf. Arist. Pol. 1293 a). All Athenian citizens could attend the public assembly or assembly. Probably the attendance at it varied from a few to several thousand. The presence of a fair percentage of the population was fixed at 3 obols, or less than 4½ drachmae a day—far less than the payment which would have been made for his services to the state. The pay of the citizen attending the assembly or the council would not cover the expenses of subsistence. On the other hand, it would be less than the pay of a day-labourer, who was probably about 4 drachmae a day, and his certificate of birth or citizenship (kolvit) was in all about 20,000—in return for their participation in political duties would receive considerable pecuniary assistance. Attending a great public festival also, the citizen would receive 2 obols or 3½ drachmae a day. On all these occasions he would have been paid public sacrifices, with the meal or feast which accompanied them.

But besides this there were institutions of private property, which produced a surplus revenue divisible among the poorer citizens. (Some held that there were confiscations in other Greek states, but not in Athens.) The absence of large amount of private money to the older men, like Isocrates should regret that the influence of the Athenians, the old court of morals and justice in Athens, had disappeared, for it maintained a sort of censorial police over the lives and actions of citizens. It was the city and life which the temple and state maintained and paternal discipline, beyond which that the strict letter of the law could mark out, over the indolent, the prodigal, the unprofitable, and the deserters of old rite and custom.

The growth and decline of emoluments and relief there was much private liberalization and charity. Many expensive public services were undertaken honorably by the citizens under a kind of civic compulsion. Thus in a trial about 475 B.C. (Lysias, Or. 19, 57) a citizen of Athens by an expense of £24,000 during his life in paying the expenses of chariots at festivals, fitting out seven triremes for the navy, and meeting levies of income tax to meet emergencies. Besides this he had helped poor citizens by giving £200. Some of the better citizens were ransomed some, and paid the funeral expenses of others (cf. for other instances Plutarch's Cimon, Theophrastus, Eth., and Xen. Ecom.).

(7) There were also mutual help societies (haima). Those for religious purposes were called religious foundations (cf. Theoph. Eth.), one of whose members would meet up contributions to help a friend who would afterwards repay the advance.

The criticisms of Aristotle (335-321 B.C.) suggest the direction to which he aimed for reform. He (Pol. 1320 a) passes a very uncomplimentary judgment on the poor people. In one of whose members would meet up contributions to help a friend who would afterwards repay the advance. They were better to see it that the greater number were not so entirely destitute, for the depravity of a democratic government was due to this. The problem was to contrive how plenty (eupomene, not poverty, dpalma) should become permanent. His proposals are adequate aid and voluntary charity. Public relief should, he urges, be given in cases of emergency, and not for daily uses. As for the poor, they should not be allowed to enter business, and the well-to-do (epistoloi) should in the meantime subscribe to pay the poor for their attendance at the public assemblies. (This proves, indeed, how the payments had become poor ever since the decline of the older state.) Aristotle had marked the deplorable standard of the destitute amongst them and gave them the most of setting to work, and the Tarentines (Tarentini) shared their property with the poor. (The Rhodians also may be mentioned (Strabo xiv. c. 62a), amongst whom the well-to-do undertook the relief of the beggars. The Rhodians went so far as to present the state with a sharing (kupon, Ep. Rom. xv. 26), which would seem to indicate that after Aristotle's time popular thought had turned in that direction. But the chief service rendered by Aristotle—a service well worth remembering—is to show that unless the purpose of civil and social life was carefully considered and clearly realized by those who desired to improve its conditions, no change for the better could result from individual or association efforts.)

Two forms of charity have still to be mentioned: charity to the stranger and to the sick. It will be convenient to consider both in relation to the whole classical period.

With the growth of towns the administration of hospitality was elaborated.

(1) There was hospitality between members of families bound by the rites of host and guest. The guest received as a right only shelter and fire. Usually he dined with the host the first day, and after that had his meals away from him. There were large guest-rooms (statoi) or small guest-houses, completely isolated on the left or right of the principal house; and here the guest was lodged. (2) There were also, e.g. at Athens (Sir Ramsay's Persia, ii. 97), brotherhoods of hospitality (epistalleis, epistalereis) for strangers. The evidence at present is not perhaps sufficiently complete, but, so far as it goes, it tends to the conclusion that in pre-Christian times hospitality was provided to passers-by and strangers in the temple buildings, from later it was furnished in the monasteries and churches. (3) There were also in towns houses for strangers (statoi) provided at the public cost. This was so at Megara; and in Crete were a place at the public meals and a dormitory. Xenophon suggested that it would be profitable for the Athenian state to establish inns for traders (katagaymis aptogia) at Athens. Thus, apart from the official hospitality of the proconsuls or "consul," who had charge of the affairs of foreigners, and the hospitality which was shown in private houses, there was an arrangement for the entertainment of strangers—for instance, at a temple of Asclepius at Epidaurus (Pausanias ii. 174); and Pausanias argues that they were common throughout the country. Probably also at the temple of Apollo (q.v.) at Corinth (ii. 2), and no doubt at other places, there were small inns and drinking-houses for strangers. (4) There were also in towns houses for strangers (statoi) provided at the public cost. This was so at Megara; and in Crete were a place at the public meals and a dormitory. Xenophon suggested that it would be profitable for the Athenian state to establish inns for traders (katagaymis aptogia) at Athens. Thus, apart from the official hospitality of the proconsuls or "consul," who had charge of the affairs of foreigners, and the hospitality which was shown in private houses, there was an arrangement for the entertainment of strangers—for instance, at a temple of Asclepius at Epidaurus (Pausanias ii. 174); and Pausanias argues that they were common throughout the country. Probably also at the temple of Apollo (q.v.) at Corinth (ii. 2), and no doubt at other places, there were small inns and drinking-houses for strangers. (5) There were also in towns houses for strangers (statoi) provided at the public cost. This was so at Megara; and in Crete were a place at the public meals and a dormitory. Xenophon suggested that it would be profitable for the Athenian state to establish inns for traders (katagaymis aptogia) at Athens. Thus, apart from the official hospitality of the proconsuls or "consul," who had charge of the affairs of foreigners, and the hospitality which was shown in private houses, there was an arrangement for the entertainment of strangers—for instance, at a temple of Asclepius at Epidaurus (Pausanias ii. 174); and Pausanias argues that they were common throughout the country. Probably also at the temple of Apollo (q.v.) at Corinth (ii. 2), and no doubt at other places, there were small inns and drinking-houses for strangers.

The sick. Round the temples, at first probably village temples, the organization of medical relief grew up. Primitive medicine was connected with dreams, worship, and liturgical observation and science (with no knowledge of chemistry and little of physiology) and asserted themselves, and a secular administration is created by the solid religious organization.

Sickness among primitive man was supposed to be a material substance to be extracted, or an evil spirit to be driven away by incantation. Religion and medicine are thus at the beginning almost one and the same thing. In Anatolia, in the groups of villages (cf. Ramsay as above, i. 106 under the Egyptian government), we find certain Aborigines, the physician and savour (arhnt and avfioi) of his people. Priests, prophets and physicians were his ministers. He punished wrongdoing by diseases which he taught the penitent to cure. So elsewhere pollution, physical or moral, was chastised by bodily ailments, and sickness and loss of property or children, and further ill were avoided by sacrifice and expiation and public warning. In the temple and out of this phase of thought grew up schools of medicine, whose practice was known as healing spiritual diseases and the ritual retained a place. The newer gods, Asclepius and Apollo, succeeded the older local divinities; and
the "sons" of Asclepius became a profession, and the temple with its adjacent buildings a kind of hospital. There were many temples of Asclepius in Greece and elsewhere, placed generally in high and salubrious positions. After ablution the patient offered sacrifices, repeating himself the words of the hymn that was chanted. Then, when they had drunk the temple water beneath the statue of the god, he was to dream "the heavenly dream" which would suggest his cure; but if he did not dream, relations and others—officials at the temple—might dream for him. At dawn the priests or sons of Asclepius took a bath, and then would visit patients who came to the temple, if necessary, and carrying out the required regimen. In the temple were votive tablets of cases, popular and awe-inspiring, and records and prescriptions, which later found their way to the medical works of Galen and others. At the temple of Asclepius at Epidaurus was an inn (kataxygòn) with four courts and colonnades, and in all 160 rooms. (Cf. Pausanias ii. 171; and Report, Archael. in Greece, R. C. Bosanquet, 1899, 1900.)

At three centres more particularly, Rhodes, Cnidus and Cos, were the medical schools of the Asclepiads. If one may judge from an inscription at Athens, priests of Asclepius attended the poor gratuitously. And years afterwards, in the 11th century, when there was a revival of medicine, we find (Daremberg, La Médecine historique et doctrines) at Salerno the Christian priest as doctor, a simple and less palatable pharmacy for the poor than for the rich, and gratuitous medical relief.

Besides the temple schools and hospitals there was a secular organization of medical aid and relief. States appointed trained medical men as physicians, and provided for them medical establishments (latreia, "large houses with large doors full of light") for the reception of the sick, and for operations there were provided beds, instruments, medicines, &c. At these places also pupils were taught. A lower degree of medical establishment was to be found at the barbers' shops. Out-patients were seen at the latreia. They were also visited at home. There were doctors' assistants and slave doctors. The latter, apparently, attended only slaves (Plato, Laws, 720); they do "a great service to the master of the house, who in this manner is relieved of the care of his slaves." It was a precept of Hippocrates that if a physician came to a town where there were sick poor, he should make it his first duty to attend to them; and the state physician attended gratis only those who applied to him. There were also travelling physicians going rounds to heal children and the poor. These methods continued, probably all of them, to Christian times.

It has been argued that medical practice was introduced into Italy by the Greeks. But the evidence seems to show that there was a quite independent Latin tradition and school of medicine (René Brian, "Médecine dans le Latium et à Rome," Rev. Archéol., 1882). In Rome there were consulting-rooms and dispensaries, and houses in which the sick were received. Hospitals are mentioned by Roman writers in the 1st century a.d. There were infirmaries—detached buildings—for sick slaves; and in Rome, as at Athens, there were slaves skilled in medicine. In Rome also for each regio there was a chief physician who attended to the poorer people.

Slavery was so large a factor in pre-Christian and early Christian society that a word should be said on its relation to charity. Indirectly it was a cause of poverty and social degradation. Thus in the case of Athens, with the gradual and unequal development of商品, the number of slaves increased greatly. Manual arts were despised as unbecoming to a citizen, and the slaves carried on the larger part of the agricultural and industrial work of the community; and for a time—until after the Peloponnesian War (404 B.C.)—slavery was an economic success. But by degrees the slave, it would seem, dispossessed the citizen and rendered him unfit for competition. The position of the free artisan thus became akin to that of the slave (Arist. Pol. 1260 a, &c.), and slavery became the industrial method of the country. Though Greeks, Romans, Jews and Christians spent money in ransoming individual slaves and also enfranchised many, no general abolition of slavery was possible. At last through economic changes the new status of coloni, who paid at first part of the produce of the land they tilled, superseded the status of slavery (cf. above; the system turned to account by Peisistratus). But this result was only achieved much later, when a new society was being created, when the slaves from the slave prisons (ergastula) of Italy joined its invaders, and the slave-owner or master, as one may suppose, unable any longer to work the gangs, let them become coloni.

In Greece the feelings towards the slave became constantly more humane. Real slavery, Aristotle said, was a cast of mind, not a condition of life. The slave was not to be ordered about, but to be commanded and persuaded like a child. The master was under the strongest obligation to promote his welfare. In Rome, on the other hand, slavery continued to the end a massive, brutal, industrial force—a standing danger to the state. But alike in Greece and Rome the influence of slavery on the family was pernicious. The pompous array of domestic slaves, the transfer of motherly duties to slave nurses, the loss of that homely education which for most people comes only from the practical details of life—all this in later Greece and Italy, and far from Christian times—was a serious development. Slavery, its invigoration and reform of family life which Jewish and Christian influences might otherwise have produced.

III. CHARITY IN ROMAN TIMES.

The words that suggest most clearly the Roman attitude towards what we call charity are liberalitas, beneficentia and pietas. The two former are almost synonymous (Cicero, De Offic. i. 7, 14). Liberalitas lays stress on the mood—that of the liber, the freeborn, and so in a sense the independent and superior; beneficence on the deed and its purpose (Seneca, De Benef. vi. 10). The conditions laid down by Cicero, following Panaetius the Stoic (185-112 B.C.) are these: not to do harm to him whom one would benefit, not to exceed one's means, and to have regard to merit. The character of the person whom we would benefit should be considered, his feelings towards us, the interest of the community, our social relations in life, and services rendered in the past. The utility of the deed or gift graded according to social relationship and estimated largely from the point of view of ultimate advantage to the giver. And so it culminates in the completeness of friendship where "all things are in common." Pietas has the religious note which the other words lack, loving dutifulness to gods and home and country. Not "piety" only but "pity" derive from it: thus it comes near to our "charity." Both books, the De Officis and the De Beneficiis, represent a Roman and Stoical revision of the problem of charity and, as in Stoicism generally, there seems to be a half-conscious attempt to feel the way to a new social standpoint from this side.

As from the point of view of charity the well-being of the community depends upon the vigour of the deep-laid elemental life within it, so in passing to Roman times we consider the family first. The Roman family was unique in its completeness, and by some of its conditions the world has long been bound. The father alone had independent authority (aut juris), and so long as he lived all who were under his power—his wife, his sons, and their wives and children, and his unmarried daughters—could not acquire any property of their own. Failing father or husband, the unmarried daughters were placed under the guardianship of the nearest male members of the family. Thus the family, in the narrower sense in which we commonly use the word, as meaning descendants of a common father or grandfather, was, as it were, a single point of growth in a larger organism, the gens, which consisted of all those who shared a complete ancestry.

The wife, though in law the property of her husband, held a position of honour and influence higher than that of the Greek wife, at least in historic times. She seems to have come nearer to the "ideal of Xenophon: "the goodwife should be the mistress of everything within the house." A house of his own and the blessing of children appeared to the Roman citizen as the end and essence
of life" (Mommens, Hist. Rome). The obligation of the father to the
sons was distinctly a home and not a school training. Brought up by the father and constantly at his side, they learned spontaneously the habits and traditions of the
farm. The sons were their school. By their father they were introduced into public life, which still remained to be accomplished during their lifetime. They became citizens, and their relation to the state was direct.
The nation was a nation of yeomen. Only agriculture and warfare were considered honourable employments. The father and sons worked outdoors on the farm, employing little or no slave labour. The wife and daughters indoors at spinning and weaving. The drudgery of the household was done by domestic slaves. The
father was the working head of a toiling household. Their chief
gods were the same as those of early Greece—Zeus-Dios and Hestia. The goddess of the hearth and home. Out of this solid, compact family Roman society was built, and so long as the
family was strong attachment to the service of the state was intense.
The res publica, the common weal, the phrase and the thought, meet one at every turn; and never were there in ancient times more patient and
sacred undertakings on their country's behalf. The men were soldiers in an unpaid militia and were constantly engaged in wars with the rivals of Rome, leaving home and family for their campaign
in the winter. With a hardness and a closeness, antithetic with—indeed, opposed to—the charitable spirit, they combined the strength of character and sense of justice
without which charity becomes sentimental and unsocial. In the
development of the family, and thus indirectly, in the development of charity, they stand for settled obligation and unrelenting duty.
Under the protection of the head of the family "in dependent freedom" lived the clients. They were in a middle position
between the freemen and the slaves. The relation between
patron and client lasted for several generations; and there were many clients. Their number increased as state after state was conquered, and they formed the plebs, in Rome the plebs urbana, the lower orders of the city.
In relation to our subject the important factors are the family, the
plebs and slavery.
Two processes were at work from an early date, before the first
agrarian law (386 B.C.): the impoverishment of the plebs and the
increase of slavery. The former led to the annona civicia, or
the free supply of corn to the citizens, and to the spolia or the
organized food-supply for poor clients, and ultimately to the
alimentarii pueri, the maintenance of children of citizens by voluntary and imperial bounty. The latter (slave-holding) and the self-sufficiency, when undermined, the talk of
relief became hopeless, and the impoverished citizen, as the
generations passed, became in turn dependant, beggar, pauper
and slave.
The great patrician families—"an oligarchy of warriors and
slaveholders"—did not themselves engage in trade, but, entering
on large speculations, employed as their agents their clients, the
libertini or freedmen, and, later, their slaves. The constant
wars, for which the soldiers of a local militia were eventually retained in permanent service, broke up the yeomanry and very
greatly reduced their number. Whole families of citizens became impoverished, and their lands were in consequence sold to the
large patrician families, members of which had acquired
lavish positions, or prospered in their speculations, and assumed
possession of the larger part of the land, the ager publicus,
acquired by the state through conquest. The city had always
been the centre of the patrician families, the patron of the trading
libertini and other dependants. It to now flocked as well the
metoci, the resident aliens from the conquered state, and unable for social reasons to turn to trade. There was thus in Rome a growing multitude of aliens, dispossessed yeomen and dependent clients. Simultaneously, slavery increased very largely after the second Punica War (202 B.C.). Every conquest brought slaves into the market, for
whom ready purchasers were found. The slaves took the place of
the freemen upon the old family estates, and the free country people became extinct. Husbandry gave place to shepherding. The
estates were thrown into large domains (latifundia), managed by
bailliffs and worked by slaves, often fettered or bound by
chains, lodged in cells in houses of labour (ergastula), and sometimes cared for when ill in infirmaries (valetudinarium). In Cretes
and Sparta the slaves toiled that the mass of citizens might have
means and leisure. In Rome the slave class was organized for
private and not for common ends. In Athens the citizens were
paid for their services; at Rome no offices were paid. Thus
the citizen at Rome was, one might almost say, forced into a
dependence on the public corn, for as the large properties
swallowed up the smaller, and the slave dispossessed the citizen,
a population grew up unfit for rural toil, disinclined to live by
methods that pride considered sordid, unstable and pleasure-loving, and yet a serious political factor, as dependent on the rich
for their enjoyments as they were on their patrons or the
prefect of the corn in the city for their food.
It is estimated, from extremely difficult and uncertain data, that
the population of Rome in the time of Augustus was about 1,200,000
or 1,500,000. At that time the plebs urbana numbered 320,000. If this be multiplied by three, to give a low average of dependent
wives and children, this section of the population would number
960,000. The remainder of the 1,500,000, 540,000, would consist of
(a) slaves, and (b) those, the comparatively few, who would be
members of great families (gens). Proportionately to Attica this seems to allow too small a population of slaves. But however this be, we may picture the population of Rome as consisting
chiefly of a few patrician families ministered to by a very large
number of slaves, and a populace of needy citizens, in whose ranks it was profitable for a rich and unscrupulous citizen to find a place in order that he might participate in the advantages of state maintenance.
In Rome the clan-family became the dominant political factor.
As in England and elsewhere in the middle ages, and even in
later times, the family, in these circumstances, assumes
an influence which is out of harmony with the common
good. The social advantage of the family lies in its
self-maintenance, its home charities, and its moral and
educational force, but if its separate interests are made
supreme, it becomes uncharitable and unsocial. In Rome this
was the line of development. The stronger clan-families crushed
the weaker, and became the "oligarchy of warriors and slaveholders."
In the same spirit they possessed themselves of the
ager publicus. The land obtained by the Romans by right of
conquest was public. It belonged to the state, and to a yeo-
man state it was the most valuable acquisition. At first part of
it was sold and part was distributed to citizens without property
and destitute (cf. Plutarch, Tib. Gracchus). At a very early date,
however, the patrician families acquired possession of much of it,
for it was profitable and not scrupulous to purchase for a
few a large portion of land, and turn it over to the
conquering farmer race was monopolized by one class, the richer
clan-families. This injustice was in part remedied by the
establishment of colonies, in which the emigrant citizens received
sufficient portions of land. But these colonies were comparatively
few, and after each conquest the rich families made large pur-
chases, while the smaller proprietors, whose services as soldiers
were constantly required, were unable to attend to their lands or
to retain possession of them. To prevent this (367 B.C.)
the Licinian law was passed, by which ownership in land was
limited to 500 jugera, about 323 acres. This law was ignored,
however, and more than two centuries later the evil, the double
evil of the dispossession of the citizen farmer and of slavery,
reached a crisis. The slave war broke out (134 B.C.) and (133 B.C.)
Tiberius Gracchus made his attempt to re-endow the Roman
citizens with the lands which they had acquired by conquest.
He undertook what was essentially a charitable or philanthropic
movement, which was set on foot too late. He had passed through
Tuscany, and seen with resentment and pity the deserted
homesteads where the former freeholders had now become
the only shepherds and cultivators. He had been brought up
under the influence of Greek Stoical thought, with which, almost
in spite of itself, there was always associated an element of pity.
The problem which he desired to solve, though larger in scale,
was essentially the same as that with which Solon and Pise-
tratus had dealt successfully. At bottom the issue lay between
private property, considered as the basis of family life for
the great bulk of the community, with personal independence,
and pauperism, with the annona or slavery. In 133 B.C. Tiberius
Gracchus became tribune. To expand society on the lines of
private property, he proposed the enforcement of "the Licinian
Charity and Charities

Rogations; the rich were to give up all beyond their rightful 312 acres, and the remainder was to be distributed amongst the poor. The measure was carried through the Senate, and followed by the death of Tiberius at the hands of the patricians, the dominant clan-families. In 132 B.C. Caius Gracchus took up his brother's quarrel, and adopting, it would seem, a large scheme of political and social reform, proposed measures for emigration and for relief. The former failed; the latter apparently were acceptable to all parties, and continued in force long after C. Gracchus had been slain (121 B.C.). Already, at times, there had been sales of corn at cheap prices. Now, by the lex frumentaria he gave the citizens—those who had the Roman franchise—the right to purchase corn every month from the public stores at rather more than half-price, 63 asses or about 3.3d. the peck. This, the fatal alternative, was accepted, and henceforth there was no possibility of a reversion to better social conditions.

The provision of a corn allowance was, that of Athens, a public service. There were public granaries (207 b.c.), and there was a questor to supervise the transit of the corn from Sicily and, later, from Spain and Africa, and an elaborate administration for collecting and conveying it. The lex frumentaria of Caius was followed by the lex Oktavii, restricting the monthly sale to citizens settled in Rome, and by 5 March leaders of the new and less Polybian gens, were required for the maintenance of a slave was 5 modii a month, and of a soldier 4. Hence, the allowance, if continued at this rate, was practically a maintenance. The lex Clodia (58 B.C.) made the corn gratuitous to the plebs urbana.

Julius Caesar (5 B.C.) found the number of recipients to be 320,000, and reduced them to 150,000. In Augustus’s time they rose to 200,000. There seems, however, to be some confusion as to the numbers. From the Archæum Monumentum it appears that the plebs urbana also received Augustus under the lex Cornelia of 60 days, in his eighth consulship, 320,000. And (Suet. Cæs. 41) it seems likely that in Caesar’s time the lists of the recipients were settled by lot; further, probably only those whose property was worth less than 400,000 sesterces (23541) were placed on the lists. It is probable, therefore, that 320,000 represents a maximum, reduced for purposes of administration to a smaller number by a property test, and by some kind of scrutiny. The names of those certified to receive the corn were exposed on bronze tablets. They were then called aerarii. They had tickets (tesserae) for purposes of identification, and they received the corn or bread in the time of the republic at the temple of Ceres, and afterwards at steps in the several (14) regions or wards of Rome. Hence the bread was called cerealia. It was mixed with bran, and given in state bakeries, and wheaten loaves were baked for the people perhaps two or three times a week. In Aurelian’s time (A.D. 270) the flour was of the best, and the weight of the loaf (unio) was doubled. To this bread were added milk, oil, and possibly, wine clothes also—white tunics with long sleeves—were distributed. In the period after Constantine (cf. Theod. Code, xiv. 15) three classes received the bread—the palace people (palatini), soldiers (militares), and the populace (populares). No distribution was permitted except at the steps. Each class was assigned its own supply. There were arrangements for the exchange of state loaves. Against misappropriation there was a penalty of one-tenth of the value. The public prosecutor (auctor), a collector of the revenue (procurator), or the slave of a senator obtained bread with the cognizance of the clerk, or by bribery, the slave, if his master was not a party to the offence. The state procurator was himself a party to the crime, according to the historian, his house was confiscated. If others who had not the right obtained the bread, they and their property were placed at the service of the bakery (pistrini exercito subjugati). If they were poor (pauperes) they were enslaved, and the delinquent client was to be put to death.

The right to relief was dependent on the right of citizenship. Hence it became hereditary and passed from father to son. It was thus in the nature of a continuous endowed charity, like the well-known family charity of Smith, in fact, in which a large property was left to the testator’s descendants, of whom it was said that as a result no Smith of that family could fail to be poor. But the annona civica was an endowed charity, affecting not a single family, but the whole population. Later, when Constantine was founded, the right to relief was attached to new houses as a premium on building operations. Thus it belonged not to persons only, but also to houses, and became a species of “immovable” property, passing to the purchaser of the house or property, as in the above days slaves were bread followed the house (cades sequantur annonam). If, on the transfer of a house, bread claims were lost owing to the absence of claimants, they were transferred to the treasury (jisci viribus vividentur). But the savage law of Valentinian, referred to above, shows to what lengths such a system was pushed. Early in its history the annona civica attracted many to Rome in the hope of living there without working. For the 400 years since the lex Clodia was enacted constant injury had been done by it, and now (a.d. 364) people had to be kept off the civic bounty as if they were birds of prey, and the very poor man (pauperinus), who had no civic title to the food, if he obtained it by fraud, was enslaved. Thus, in spite of the abundant state relief, there had grown up a class of the very poor, the Gentiles of the state, who were outside the sphere of its ministrations. The annona civica was introduced not only into Constantinople, but also into Alexandria, with baleful results, and into Antioch. When Constantine was founded the corn-ships of Africa sailed there instead of to Rome. On charitable relief, as we shall see, the annona has had a long-continued and fatal influence.

1. If the government considers itself responsible for provisioning the citizens in distress it must fix some limit. The term “distress” or “popularity” will lower the price. It becomes thus a large relief society for the supply of corn. In a time of distress, when the corn laws were a matter of moment in England, a similar system was introduced into the well-known and well-regulated country of which a larger or lesser allowance was given to a family according to its size and the prevailing price of corn. A maintenance was thus provided for the able-bodied and their families, at least in part, without any work on the part of the able-bodied and their families, and at any rate without any work or labour. The amount of the allowance was fixed by the applicant, and work was done more or less perfunctorily. In amount the Roman dole seems to have been equivalent to the allowance provided for a slave, but the citizen received it without any danger of having it revoked as a statutory right. There could hardly be a more effective means of banishing the manhood and denaturalizing his family. He was also a voter, and the alms appealed to his weakness and indolence; and the fear of displeasing him and losing his vote kept him, socially, master of the situation to his own ruling. If in England now relief were given to able-bodied persons who retained their votes, this evil would also attach to it.

2. The system obliged the hands-working to maintain the idlers, who continually increased their number. The needy teacher in Juvenal, instead of a fee, is put off with a tessera, to which, not being a citizen, he has no right. “The foreign reapers,” it was said, “filled Rome’s belly and left Rome free for the stage and the circus.” This was chiefly the case before 400, when the dole, which at first was paid in days of ease had become habitual, the games, the circus, the theatre, dice, eating-houses and brothels. Here are all the marks of a degraded pauperism.

3. The dole as a whole led the way to an ever more extensive slavery. The man who could not live on his dole and other scruples had the alternative of becoming a slave. “Better have a good master than live so distressfully”; and “If I were free I should live at my own risk; now I live at yours,” are the expressions suggestive of the situation to his own ruling. In England now relief were given to able-bodied persons who retained their votes, this evil would also attach to it.

4. The effect on agriculture, and proportionally on commerce generally, and particularly in respect of the staple articles of food. The food, which was withdrawn from the trade—the market to which all the necessaries of life would naturally have gravitated; and the supply of corn was placed in the hands of producers at a few centres where it could be purchased at a higher price—made the staple commodity of the Roman Empire was to turn his attention to another produce—the cultivation of the olive and the vine, and cattle and pig rearing. The greater the extension of the system the more impossible was the regeneration of Rome. One had result of the annona was that it encouraged a special and ruinous form of charitable mendicancy.
The *sportula* was a form of charity corresponding to the annona cistica. Charity and poor relief run on parallel lines, and when the one is administered without discrimination, little discrimination will usually be exercised in the other. The charity of the patron was the chief concern of the children of the clan-families to their clients. Between them it was natural that a relation, partly hospital, partly charitable, should grow up. The clients who attended the patron at his house were invited to dine at his table. The patron, as Juvenal describes him, dined luxuriously and in solitary grandeur, while the guests put up with what they could get; or, as was usual under the empire, instead of the dinner (*coena recta*) a present of food was given at the outer vestibule of the house to clients who brought with them baskets (*sportula*) to carry off their food, or even charcoal stoves to keep it warm. There was endless trickery. The patron (or almoner who acted for him) tried to identify the applicant, fearing lest he might get the dole under a false name; and at each mansion was kept a list of persons, male and female, entitled to receive the allowance. "The pilifer grubs the dole" (*sportulam furanuncus capital*): a proverb. The *sportula* was a charity sufficiently important for state regulation. Nero (A.D. 54) reduced it to a payment in money (100 quadrantes, about 1s.). Domitian (A.D. 81) restored the custom of giving food. Subsequently both practices—gifts in money and in food—appear to have been continued.

In these conditions the Roman family was steadily decayed. Its "old discipline" was neglected; and Tacitus (A.D. 75), in his dialogue of Patrons, wrote (c. xxviii) that it had lost all its old discipline. Of the general decline the laws of Caesar and Augustus to encourage marriage and to reward the parents of large families are sufficiently evident.

The destruction of the working-class family must have been finally achieved by the imperial control of the collegia. In old Rome there were corporations of craftsmen for common worship, and for the maintenance of the traditions of the craft. These corporations were ruined by slave labour, and becoming secret societies, in the time of Augustus were suppressed. Subsequently they were reorganized, and gave scope for much friendliness. They often existed in connexion with some great house, whose chief was their patron and whose household gods they worshipped. The guilds of the poor, or rather of the lower classes (*collegia *lunarium*), consisted of artisans and others, and slaves also, who paid monthly contributions to a common fund to meet the expenses of worship, common meals, and funerals. They were not in Italy, it would seem, Consult (J. P. Waltzing, *Etudes histor.*, sures ex certa epistola des Romans, t. 145, 300), though they may have been in Asia Minor and elsewhere, societies for mutual help generally. They were chiefly funeral benefit societies. Under Severus (A.D. 192) the collegia were extended and more closely supervised by the imperial government; they were well controlled, as in England in the 12th century the municipalities affected the cause of the craft guilds and ended by controlling them. Industrial disorder was thus prevented; the government were able to provide the supplies required in Rome and the large cities with less expenditure, and the workers employed, especially the carrying trade, became almost slaves. In the 2nd century, and until the invasions, there were three groups of collegia: (1) those engaged in various state manufactures; (2) those engaged in the lower orders of workmen (the collegia *lunaria*, and the tradesmen, who were forced to enter into a kind of slavery. If the members of these guilds fled they were brought back by force. Parents had to keep to the trade to which they belonged; their children had to succeed them in it. A slave cannot, of course, have been fed up, and a special service for their maintenance established. Two instances are recorded in inscriptions—one at Veleia, one at Beneventum. The emperor lent money for the purpose at a low percentage—2½ or 3½% as against the usual 10 or 12. At Veleia his loan amounted to 1,000,000 sesterces; and at Beneventum 1,156,450, and 51 of the local landed proprietors mortgaged land, valued at 13,270,140,000 million

sutures, as security for the debt. The interest on the emperor's money at 5% was paid into the municipal treasury, and out of it the children were relieved. The figures seem small; at Veleia 300 children were assisted, of whom 56 were girls. The annual interest at 5% amounted to nearly £408, which divided among 300 gives about 3s. a head. These figures suggest that the money served as a charitable supplementation of the citizens' relief in direct aid of the children. Apparently the scheme was widely adopted. Curators of high position were the patrons; procurators acted as inspectors over the works, and the house was under the charge of a local management. Antoninus Pius (A.D. 138), and Marcus Aurelius (A.D. 160), and subsequently Severus (A.D. 192) established these bursaries for children in the names of their wives. In the 3rd century the house fell into disuse, and in the 5th, and in the military anarchy that ensued it came to an end. It is of special interest, as indicating a new feeling of responsibility towards children akin to the humane Stoicism of the Antonines, and an attempt to found a permanent type of *sportula* or collegia, what in the nature of a public endowed charity.

**Part IV.—Jewish and Christian Charity**

With Christianity two elements came into fusion, the Jewish and the Greco-Roman. To trace this fusion and its results it is necessary to describe the Jewish system of charity, and to compare it with that of the early Christian church, to note the theory of love of friendship in Aristotle as representing Greek thought, and Jewish charity in its Christian development, and to mark the Roman influences which moulded the institution of Ambrose and Gregory and Western Christianity generally.

In the early history of the Hebrews we find the family, clan and tribe. With the Exodus (probably about 1500 B.C.) comes the law of Moses (cf. Kittel, *Hist. of the Hebrews*, Eng. trans. i. 244), the central and permanent element of Jewish thought. We may compare it to the "commandments" of Hesiod. There is the recognition of the family and its obligations: "Honour thy father and mother"; and honour included help and support. There is also the law essential to family unity: "Thou shalt not commit adultery"; and as to property there is imposed the regulation of desire: "Thou shalt not covet thy neighbour's house." Maimonides (A.D. 1135), true to the old conception of the family (x. 16), calls the support of adult children, "after one is exempt from supporting them," and the support of a father or mother by a child, "great acts of charity; since kindred are entitled to the first consideration." To relief of the stranger the Decalogue makes no reference, but in the Hebraic laws it is constantly pressed; and the Levitical law (xix. 18) goes further. It first applies a new standard to civic life: "Thou shalt love thy neighbour as thyself." The conception of the "neighbour" is not that of the element which the Jews brought into the work of charity. In Judges and Joshua, the "Homeric" books of the Old Testament, the Hebrews appear as a passionately fierce and cruel people. Subsequently against their oppression of the poor the prophets protested with a vehemence as great as the evil was intense; and their denunciations remained part of the national literature, a standing argument that life without charity is nothing worth. Thus schooled and afterwards tutored into discipline by the tribulation of the exile (587 B.C.), they turned their fierceness into a zeal, which, as their literature shows, was as fervent in ethics as it was in religion and ceremonial. In the services at the synagogues, which supplemented and afterwards took the place of the Temple, the Commandments were constantly repeated and the Law and the Prophets read; and as the Jews of the Dispersion increased in number, and especially after the destruction of Jerusalem, the synagogues became centres of social and charitable co-operation. Thus rightly would a Jewish rabbi say, "On three things the world is stayed: on the Thorah (or the law), and on worship, and on the bestowal of kindness." Also there was on the charitable side an indefinite power of expansion. Rigid in its ceremonial, there it was free. Within the Synagogue, as the Prophets, and after the exile, as the Psalms show, there was the hope of a universal religion, and with it of a universally recognized charity. St Paul accentuated the prohibitive side of the law and protested against it; but, even while he was so doing, stimulated by the Jewish discipline, he was moving unfettered new conceptions of charity and life—
CHARITY AND CHARITIES 889

CHARITY and the central word of the Christian life, and life as a participation in a higher existence—the “body of Christ.” To mark the line of development, we could compare—1. The family among the Jews and in the early Christian church; 2. The sources of relief and the tithes, the treatment of the poor and their aid, and the assistance of special classes of poor; 3. The care of strangers; and, lastly, we would consider the theory of almsgiving, friendship or love, and charity.

1. As elsewhere, property is the basis of the family. Wife and children are the property of the father. But the wife is held in high respect. In the post-exilian period the virtuous wife is represented as laborious as a Roman matron, a “lady bountiful” to the poor, and to her husband wife and friend alike. Monogamy without concubinage is now the rule—is taken for granted as right. There is no “exposure of children.” The slaves are kindly treated, as servants rather than slaves—though in Roman times and afterwards the Jews were great slave-traders. The household is not allowed to eat the bread of idleness. “Six days,” it was said, “must [not mayest] thou work.” “Labour, if poor; but find work, if rich.” Whoever does not teach his son business or work, teaches him idleness. In the third century B.C., when the expression which has been called “an inventory of late Old Testament morality,” we find the family life developed side by side with the life of charity. In turn are mentioned the relief of the widow, the fatherless and the stranger—the classification of dependents in the Christian church; and the whole chapter is a justification of the homely charities of a good family.

“The Jewish religion, more especially in the old and orthodox form, is essentially a family religion” (C. G. Montefiore, Religion of Ancient Hebrews).

In the early documents of the Church the fifth commandment is made the basis of family life (cf. Eph. vi. 1; Apos. Const. ii. 32, iv. 11—if we take the first six books of the Apos. Const. as a composite production before a.d. 300, representing Jewish-Christian or Eastern church thought). But two points are prominent. Duties are insisted on as reciprocal (cf. especially St Paul’s Epistles), as, e.g. between husband and wife, parent and child, master and servant. Charity is mutual; the family is a circle of reciprocal duties and charities. This implies a principle of the greatest importance in relation to the social utility of the family: each member is made to labor. Next the “thou shalt love thy neighbour” is translated from its position as one among many sayings to the chief place as a rule of life. In the Didaché or Teaching of the Twelve Apostles (Jewish-Christian, c. 90-120 A.D.) the first commandment in “the way of life” is adapted from St Matthew’s Gospel thus: “First, thou shalt love God who made thee; secondly, thy neighbour as thyself; and all things whatsoever thou wouldst not have done to thee, neither do thou to another.” A principle is thus applied which touches all social relations in which the “self” can be made the standard of judgment. Of this also later. To touch on other points of comparison: the earlier documents seem to ring with a reiterated cry for a purer family life (cf. the second, the negative, group of commandments in the Didaché, and the judgment of the apocalyptic writings, such as the Revelations of Peter, &c.); and, sharing the Jewish feeling, theiper conscience of the Christian community formulates and accepts the injunction to preserve infant life at every stage. It advocates, indeed, the Jewish practice of infanticide with a certain fervor, and it makes of it a criterion of church membership.

The Jewish rule of labour is enforced (Ap. Const. ii. 63). If a stranger settle (Didaché, xii. 3) among the brotherhood, “let him work and eat.” And the father (Constit. iv. 11) is to teach the children “such trades as are agreeable and suitable to their need.” And the charities to the widow, the fatherless, are organized on Jewish lines.

2. The sources of relief among the Jews were the three gifts of corn: (1) the corners of the field (cf. Lev. xix. &c.), amounting to a sixtieth part of it; (2) the gleanings, a definite minimum dropped in the process of reaping (Maimonides, Laws of the Hebrews relating to the Poor, iv. 1); (3) corn overlooked and left behind. So it was with the grapes and with all crops that were harvested, as opposed, e.g. to figs, that were gathered from time to time. These gifts were divisible three times in the day, so as to suit the convenience of the poor (Maim. ii. 17), and the poor had a right to them. They are indeed a poor-rate paid in kind such as in early times would naturally spring up among an agricultural people. Another gift “out of the seed of the earth,” is the tithe. In the post-exilian period the septennium was in force. Each year a fiftieth part of the produce (Maim. vi. 2, and Deut. xviii. 4) was given to the priest (the class which in the Jewish state was supported by the community). Of the remainder one-tenth went to the Levite, and one-tenth in three years the septennium was retained for pilgrimage to Jerusalem, in two given to the poor. In the seventh year “all things were in common.” Supplementing these gifts were alms to all who asked; “and he who gave less than a tenth of his means was a man of evil eye” (Maim. vii. 5). All were to give alms, even the poor themselves who were in receipt of relief. Refusal might be punished with stripes at the hand of the Sanhedrin. At the Temple alms for distribution to the worthy poor were placed by worshippers in the cell of silence; and it is said that in Palestine at meal times the table was open to all comers. As the great rabbinical work of the period, the Babylonian Talmud (a.d. 70), the collections of alms was further systematized. There were two collections. In each city alms of the box or chest (kupha) were collected for the poor of the city on each Sabbath eve (later, monthly or thrice a year), and distributed in money or food for seven days. Two collected, three distributed. Three others gathered and distributed daily alms of the basket (tamchui). These were for strangers and wayfarers—casual relief “for the poor of the whole world.” In the Jewish synagogal community from early times the president (parrasim) and treasurer were elected annually with seven heads of the congregation (see Abraham’s Jewish Life in the Middle Ages, p. 54), and sometimes special officers for the care of the poor. A staff of almoners was thus forthcoming. In addition to these collections were the pruta given to the poor before prayers (Maim. x. 15), and moneys gathered to help particular cases (cf. Jewish Life, p. 322) by circular letter. There were also gifts at marriages and funerals; and fines imposed for breach of the communal ordinances were reserved for the poor. The distinctive feature of the Jewish charity was the belief that “the poor shall not cease out of the land,” and that therefore on charitable grounds a permanent provision should be made for them—a poor-rate, in fact, subject to stripes and distress, if necessary (Maim. vii. 10; and generally cf. articles on “Alms” and “Charity” in the Jewish Encyclopaedia).

If we compare this with the early church we find the following sources of relief: (1) The Eucharistic offerings, some consumed at the time, some carried home, some reserved for the absent (see also Mt. xxvi. 26; Mk. xiv. 24; Lk. xxii. 19, &c.); and (2) Freewill offerings and first-fruits and voluntary tithes (Ap. Con. ii. 25) brought to the bishop and used for the poor—orphans, widows, the afflicted and strangers (cf. Macc. iv. 21, 67; vi. 40). Moreover and for the collection, and distribution of charity (Maimonides, Baker, 200) in churches on Sundays and week-days, alms-boxes and gifts to the poor by worshippers as they entered church; also collections for special purposes (cf. for Christians at Jerusalem). Apart from the former, the bishop, the council, or the synagogues were the collectors. But in both bodies there is a beneficent system and excommunication (cf. Jewish Life, p. 52), and in both a settlement of disputes within the body (Clem. Rom. iii. 67). In both, too, there is the abundant alms distributed in the body and distributed in the person of the bishop, and in both there is the habit of giving to all who ask. As to administration in the early church (Acts vi. 3) we find seven deacons, the number of the local Jewish council; and later there were in Rome seven ecclesiastical relief officers, each in charge of a deacon. The deacon acted as the minister of the bishop (Epp. Clem. to Jam. xii.), reporting to him and giving as he dictated (Ap. Con. ii. 30, 31). He at first combined disciplinary powers with charitable. The presbyters also (Polycarp, Ad Philad, 13; Ep. 6, v. 69—75), forming (Hatch, p. 69) a kind of bishop’s council, the see, &c. The bishop was president and treasurer. The bishop was thus the trustee of the poor. By reason of the churches’ care of orphans, responsibilities of trustiness also
devolved on him. The temples were in pagan times depositories of money. Probably the churches were also.

3. Great stress is laid by the Jews on the duty of gentleness to the poor (Maim. x. 5). The woman was to have first attention (Maim. vi. 13). If the applicant was hungry he was to be fed, and then examined to see whether he was a deceiver (Maim. vii. 6). Assistance was to be given according to the want—clothes, household things, a wife or a husband—and according to the poor man's station in life. For widows and orphans the “gleanings” were left. Both are the recognized objects of charity (Maim. x. 16, 17). “The poor and the orphan were to be employed in domestic affairs in preference to servants.”

The dower was a constant form of help. The ransoming of slaves took precedence of relief to the poor. The highest degree of alms-deed (Maim. x. 7) was “to yield support to him who is cast down, either by means of gifts, or by loan, or by commerce, or by procuring for him traffic with others. Thus his hand becometh strengthened, exempt from the necessity of soliciting succour from any created thing.”

If we compare the Christian methods we find but slight difference. The absoluteness of “Give to him that asketh” is in the Didache checked by the “Woe to him that receiveth: for if any receives having need, he shall be guiltless, but he that has no need shall give account, . . . and coming into distress. . . . he shall not come out thence till he hath paid the last farthing.” It is the duty of the bishop to know who is most worthy of assistance (Ap. Con. ii. 3, 4); and “if any one is in want by gluttony, drunkenness, or idleness, he does not deserve assistance, or to be esteemed a member of the church.” The widow assumes the position not only of a recipient of alms, but a church worker. Some were a private charge, some were maintained by the church. The recognized “widow” was maintained: she was to be sixty years of age (cf. 1 Tim. v. 9 and Ap. Con. iii. 1), and was sometimes tempted to become a bedeswoman and gossip pauper, if one may judge from the texts. Remarriage was not approved. Orphans were provided for by members of the churches. The virgins formed another class, as, contrary to the earlier feeling, marriage came to be held a state of lesser sanctity. They too seem to have been also, in part, least, church workers. Thus round the churches grew up new groups of recognized dependents; but the older theory of charity was broad and practical—akin to that of Maimonides. “Love all your brethren, performing to orphans the part of parents, to widows that of husbands, affording them sustenance with all kindliness, arranging marriages for those who are in their prime, and for those who are without a profession the means of necessary support through employment: giving work to the artificer and alms to the incapable” (Ep. Clem. to James viii.).

4. The Jews in pre-Christian and Talmudic times supported the stranger or wayfarer by the distribution of food (lammih); the strangers were lodged in private houses, and there were inns provided at which no money was taken (cf. Jewish Life, p. 314). Subsequently, besides these methods, special societies were formed “for the entertainment of the resident poor and of strangers.” There were commendatory letters also. These conditions prevailed in the Christian church also. The Xenodochion, coming by direct succession alike from Jewish and Greek precedents, was the first form of Christian hospital both for strangers and for members of the Christian churches. In the Christian community the endowment charity comes into existence in the 4th century, among the Jews not till the 13th. The charities of the synagogue without separate societies sufficed.

We may now compare the conceptions of Jews and Christians on charity with those of the Greeks. There are two chief exponents of the diverse views—Aristotle and St. Paul; for to simplify the issues we refer to them only. Thoughts such as Aristotle’s, recast by the Stoic Panætius (185–112 B.C.), and used by Cicero in his De Officis, became in the hands of St. Ambrose arguments for the direction of the clergy in the founding of the medieval church; and in the 13th century Aristotle reasserts his influence through such leaders of medieval thought as St. Thomas Aquinas. St. Paul’s chapters on charity, not fully appreciated and understood, one is inclined to think, have perhaps more than any other words prevented an absolute lapse into the materialism of almsgiving. After him we think of St. Francis, the greatest of a group of men who, seeking reality in life, revived charity; but to the theory of charity it might almost be said that since Aristotle and St. Paul nothing has been added until we come to the economic and moral issues which Dr. Chalmers explained and illustrated.

The problem turns on the conception (1) of purpose, (2) of the self, and (3) of charity, love or friendship as an active force in social life. To the Greek, or at least to Greek philosophic thought, purpose was the measure of goodness. To have no purpose was, so far as the particular act was concerned, to be simply irrational; and the less definite the purpose the more irrational the act. This conception of purpose was the touchstone of family and social life, and of the civic life also. In no sphere could goodness be irrational. To say that it was without purpose was to say that it was without reality. So far as the actor was concerned, the main purpose of right action was the good of the soul (psyche); and by the soul was meant the better side, the rational part acting in harmony with every faculty and function of the man. With the self thus brought into focus, a higher life was gradually developed, a higher life was realized.

The issue is whether we will open them and pass in.

Consistent with this is the social purpose. Love or friendship is not conceived by Aristotle except in relation to social life. Society is based on an interchange of services. This interchange in one series of acts we call justice; in another friendship or love. A man cannot be just unless he has acquired a certain character or habit of mind; and hence no just man will act without knowledge, previous deliberation and definite purpose. So also will a friend fulfill these conditions in his acts of love or friendship. In the love existing between good men there is continuance and equality of service; but in the case of benefactor and benefited, in deeds of charity, in fact, there is no such equality. The satisfaction is on one side but often not on the other. The dilemma is one that is pressed, though not satisfactorily, in Cicero and Seneca. The reason for this will be found, Aristotle suggests, in the feeling of satisfaction which men experience in action. We realize ourselves in our deeds—throw ourselves into them, as people say; and this is happiness. What we make we like; it is part of us. On the other hand, in the person benefited there may be no corresponding action, and in so far as there is not, there is no exchange of service or the contentment that arises from it. The self of the recipient is not drawn out. On the contrary, he may be made worse, and feel the uneasiness and discontent that result from this. In truth, to complete Aristotle’s argument, the good deed on one side, as it represents the best self of the benefactor, should on the other side draw out the best self of the person benefited. And where there is not ultimately this result, there is not effective friendship or charity, and consequently there is no personal or social satisfaction. The point may be pushed somewhat further. In recent developments of charitable work the term “friendly visitor” is applied to those who endeavour to help families in distress on the lines of associated charity. It represents the work of charity in one definite light. So far as the relation is mutual, it cannot, at the outset be said to exist. The charitable friend wishes to befriend another; but at first there may be no reciprocal feeling of friendship on the other’s part—indeed, such a feeling may never be created. The effort to reciprocate kindness by becoming what the friend desires may be too painful to make. Or the two may be on different planes, one not really befriending, but giving without intelligence, the other not really endeavouring to change his nature, but receiving help solely with a view to immediate advantage. The would-be befriender may begin “despairing of no man,” expecting nothing in return; but if, in fact, there is never any kind of return, the friendship actually falls of its purpose, and the “friend’s” satisfaction is lost, except in that he may “have loved much.” In any case,
CHARITY AND CHARITIES

According to this theory, friendship, love, and charity represent the mood from which spring social acts, the value of which will depend on the knowledge, deliberation, and purpose with which they are done, and accordingly as they acquire value on this account will they give lasting satisfaction. St Paul's point is different. He seems at first sight to ignore the association of social life. He lays stress on motive force rather than on purpose. He speaks as an outsider to the state, though technically a citizen. His mind assumes towards it the external Judaic position, as though he belonged to a society of settlers (πάροικοι). Also, as he expects the millennium, social life and its needs are not uppermost in his thoughts. He considers charity in relation to a community of fellow-believers—drawn together in congregations. His theory springs from this social base, though it overarches life itself. He is intent on creating a spiritual association. He conceives of the spirit (πνεῦμα) as "an immaterial personality." It transcends the soul (ψυχή), and is the Christ life, the ideal and spiritual life. Christians participate in it, and they thus become part of "the body of Christ," which exists by virtue of love—love akin to the ideal life, ἀγάπη. The word represents the love that is instinct with reverence, and not love (φίλα) which may have in it some quality of passion. This love is the "life of the Christ." Therefore no act done without it is a living act—but, on the contrary, must be dead—an act in which no part of the ideal life is blended. On the individual act or the purpose no stress is laid. It is assumed that love, because it is of this intense and exalted type, will find the true purpose in the particular act. And, when the expectation of the millennium passed away, the theory of the ideal life, charity remained as a motive force available to act whenever new concerns, spiritual or social, might arise. Nevertheless, no sooner does this charity touch social conditions, than the necessity asserts itself of subordinating to the limitations which knowledge, deliberation, and purpose impose. This view had been depreciated or ignored by Christians, who have been content to rely upon the strength of their motives, or perhaps have not realized what the Greeks understood, that society was a natural organism (Arist. Pol. 1253a), which develops, fails or prospers in accordance with definite laws. Hence endless failure in spite of some successes. For love, whether we idealize it as ἀγάπη or consider it a social instinct as φίλα, cannot be love at all unless it quickens the intelligence as much as it animates the will. It cannot, except by some confusion of thought, be held to justify the indulgence of emotion irrespective of moral and social results. Yet, though this fatal error may have dominated thought for a long time, it is hardly possible to attribute it to St Paul's theory of charity when the very practical nature of Judaism and early Christianity is considered. In his view the misunderstanding could not arise. And to create a world or "body" of men and women linked together by love, even though it be outside the normal life of the community, was to create a new form of religious organization, and to achieve for it (so far as it was achieved) what, mutatis mutandis, Aristotle held to be the indispensable condition of social life, friendship (φίλα), "the greatest good." For "Socrates and all the world declared," he wrote, that "the unity of the state" is "created by friendship" (Arist. Pol. ii. 1262 b).

It should, however, be considered to what extent charity in the Christian church was devoid of social purpose. 1) The Jewish conceptions of charity passed, one might almost say, in their completeness into the Christian church. Prayer, the petition and the purging of the mind, the fasting, the humiliation of the body, and, as part of the same discipline, submission of the soul, appeared to be the essential elements of the discipline that was to create the religious mood. Alms henceforth become a definite part of the religious discipline and service. Humility and poverty hereafter appear as yoked virtues, and many problems of charity are raised in regard to them. The first centuries of the Christian church had no less than the Christian world appreciated more and more the need of self-discipline (ἐσώτερα); and it seems as though in the first two centuries A.D. those who may have thought of reinvigorating society searched for the remedy rather in the preaching and practice of temperance than in the application of ideas that were the outcome of the observation of social or economic conditions. Having no object of this kind as its mark, almsgiving took the place of charity, and, as Christianity triumphed, the family life, instead of reviving, continued to decay, while the virtues of the discipline of the body, considered apart from social life, became an end in themselves, and it was desired rather to annihilate instinct than to control it. Possibly this was a necessary phase in a movement of progress, but how that charity, as St Paul understood it, should be practised. 2) But this was not the case. Religious philosophy is not elaborated as a consistent whole by any one writer. It is rather a miscellany of maxims; and again and again, as in many religious thought, side issues assume the principal place. The literature of the first centuries is full of these instances. Man's spiritual values and thoughts and motives are blended. The Jews spoke of the poor as the means of the rich man's salvation. St Chrysostom emphasizes this: "If there were no poor, the greater part of your sins would not be remitted, and the preaching of the crucifixion would be rendered void." (Hom. xiv, Timothy, &c., cf. St Cyprian on works and alms). Alms are the medicine of sin. And the same thought is worked into the penitential system. Augustine speaks of "penance such as fasting, almsgiving, and prayer against the attacks of the devil." (Reichel, Manual of Canon Law, p. 293) and many other writers might be cited. "Pecuniary penances (D. 154), in so far as they were relaxations of, or substitutes for, bodily penances, were permitted because of the greater good thereby accruing to others (and in this sense the Church had preserved the old statute law). The penitential system takes for granted that the almsgiving is good for others and puts a premium on it, even though in fact it was done, not with any definite object, but really for the good of the giver. This almsgiving is not a development from a real concern for charity, and the one side and from social good on the other. Still further is it vulgarized by another confusion of thought. It is considered that the alms are paid to the credit of the giver, and are realized as a benefit. For both the present and the future the prosperity of others may be obtained, or at least evil accident avoided. Thus motives were blended, as indeed they now are, with the result that the gift assumed a greater importance than the charity, by which alone the gift should have been sanctioned, and its actual effect was habitually overlooked or treated as only partially relevant.

(3) The Christian maxim of "loving (ἀγάπη) one's neighbour as one's self" sets a standard of charity. Its relations are idealized according as the "self" is understood; and thus the good self becomes the measure of the almsgiving and its extension to the complete the charity; and the charity of the best men, men who love and understand their neighbours best, having regard to their chief good, is the best, the most effectual charity. Further, if in what we consider "self" we get but a lesser part of the social purpose or even allow it no place at all, our "self" will have no sufficient social aim and our charity little or no social result. For this "self" however, religion has substituted not St Paul's conception of the spirit (πνεῦμα), but a soul, an animal soul, a substantial nature, whose punishment of sins and felicitous advancements in the after-life; and in so far as the safeguard of this soul by good deeds or almsgiving has become a paramount object, the purpose of charitable action has been translated from the actual work to the being understood. The poor were conscious that they had been considered not an object in itself, but as a means by which the almsgiver effects his own ulterior purpose and "makes God his debtor." The problem thus handled raises the question of reward and intoxication of thought and the claims of charity over the claims of personal prosperity or credit. Both are excluded. We may indeed act from a complexity of motives and expect a complexity of rewards, and undoubtedly a good act does refresh the "self," and may as a result, though not as a reward, win approval. But in reality reward, if the word be used at all, is according to purpose; and the only reward of a deed lies in the fulfilment of its purpose. In the theory of almsgiving which we are discussing, however, act and reward are on different planes. The reward is on that of a future life; the act related to a distanced personal interest. We are now in fact in his second part, it is a selflessness in his post-mortal consequences to himself, and not either wholly or chiefly in the act itself. Nor, as the interest ends with the act—the giving—can the intelligence be quickened by it. The question arises, what plan do we put to the world? Will we buy with what result?" receive no detailed consideration at all. Two general results follow. In so far as it is thus practised, almsgiving is out of sympathy with social progress. It is indeed alien to it. Not only will it fail to give relief and does without it, is outside the range of its thought and understanding. On the other hand, this almsgiving is equally incapable of influencing the weak and the vicious; and those who are suffering from illness or trouble it has not the width of vision to make its purpose. Nor can it possibly be believed that this almsgiving will fall out of the ranks of the self-supporting. It believes that the "poor" will not cease out of the land. And indeed, however great might be the economic progress of the people, it is not likely that either in thought or in practice there will be a great amount to affect social conditions seriously one way or the other. When we measure the effects of charity, that inheritance of divided thought and inconsistent counsels must be given its full weight.

The sub-apostolic church was a congregation, like a synagogue, the centre of a system of voluntary and personal relief, connected
with the congregational meals (or διακοσμία) and the Eucharist, and
under the supervision of no single officer or bishop. Out
of this was developed a system of relief controlled by a
bishop, who was assisted chiefly by deacons or
presbyters, while the διακοσμία, consisting of offerings
laid before the altar, still remained. Subsequently
the meal was separated from the sacrament, and
became a dole of food, or poor people’s meal—e.g. in
St Augustine’s time in western Africa—and it was not allowed
to be served in churches (A.D. 391). As religious asceticism
became dominant, the sacrament was taken fasting; it appeared
unseemly that men and women should meet together for such
purposes, and the διακοσμία fell out of repute. Simultaneously
it would seem that the parish (responsa) became from a con-
gregational settlement a geographical area.

The organization of relief at Rome illustrates both a type of
administration and a transition. St Gregory’s reforms (A.D. 590)
largely developed it. The first factor in the transition was the
church fund of the second period of Christianity, about A.D. 150
to about 200 (Tertullian, Apol. 30). It served as a friendly fund,
was supported by voluntary gifts, and was used to purchase
and to bury the poor, to help destitute and orphaned children,
old household slaves and those who suffered for the faith. This
fund is quite different from the collegia tenniorum or funeraria
of the Romans, which were societies to which the members paid
stipulated sums at stated periods, for funeral benefits or for com-
mon meals (J. P. Watzling, Corporations professionnelles chez les Romains, i. 313). It represents the charitable centre round
which the parochial system developed. That system was
adopted probably about the middle of the 3rd century, but in
Rome the diaconate probably remained centralized. At the
end of the 4th century Pope Anastasius had founded deaconries
in Rome, and endowed them largely “to meet the frequent
demands of the diaconate.” Gregory two hundred years later
reorganized the system. He divided the fourteen old “regions”
into seven ecclesiastical districts and thirty “titles” (or parishes).
The parishes were under the charge of sixty-six priests; the
districts were ecleemosynary divisions. Each was placed under
the charge of a deacon, not (Greg. Ep. xi. and xxviii.) under the
priests (presbyteri titularii). Over the deacons was an archdeacon.
It was the duty of the deacons to care for the poor, widows,
orphans, wards, and old people of their several districts. They
inquired in regard to those who were relieved, and drew up
under the guidance of the bishop the register of poor (matricula).
Only these received regular relief. In each district was an
hospital or office for alms, of which the deacon had charge,
assisted by a steward (or oeconomus). Here food was given
and meals were taken, the sick and poor were maintained, and orphan
or foundling children lodged. The churches of Rome and of
other large towns possessed considerable estates, “the patrimony
of the patron saints,” and to Rome belonged estates in Sicily
which had not been ravaged by the invader, and they continued
to pay to it their tenth of corn, as they had done since Sicily
was conquered. Four times a year (Milman, Lat. Christ. ii. 117)
the shares of the churches, clergy and papal officers, (2) churches and
monasteries, and (2) “houses and hospitals, deaconries and.relief
wards for the poor,” were calculated in money and distributed;
and the first day in every month St Gregory distributed to the poor
in kind corn, wine, cheese, vegetables, bacon, meal, fish
and oil. The sick and infern were superintended by persons
appointed to inspect every street. Before the pope sat down to his
own meal a portion was separated and sent out to the hungry
at his door. The Roman plesbs had thus become the poor of Christ
(pawpers Christi), and under that title were being fed by civica
annona and sportula as their ancestors had been; and the deacon-
ries had superseded the “regions” and the “steps” from which
the corn had been distributed. The hospitium was now part of
a common organization of relief, and the sick were visited according
to Jewish and early Christian precedent. How far kindly Romans
visited the sick of their day we do not know. Alms and the
annona were now, it would seem, administered concurrently;
and there was a system of poor relief independent of the churches
and their alms (unless these, organized, as in Scottish towns,
on the ancient ecclesiastical lines, were paid wholly or in part to a
central diaconate fund). Much had changed, but in much Roman
thought still prevailed.

On lines similar to these the organization of poor relief in the
middle ages was developed. In the provinces in the later empire
the senate or ordo decurionum were responsible for the public
provisioning of the towns (Fustel de Coulanges, La Gaule romaine,
p. 251), and no doubt the care of the poor would thus in some
measure devolve on them in times of scarcity or distress. On
the religious side, on the other hand, the churches would probably
be constant centres of almsgiving and relief; and then, further,
when the Roman municipal system had decayed, each citizen
(as in Charlemagne’s time, 742-814) was required to support his
own dependants—a step suggestive of much after-history.

The change in sentiment and method could hardly be more
strongly marked than by a comparison of “the Teaching” with St Ambrose’s (334-397) Duties of the Clergy (De Officis Min-
istris). For the old system was a system. For the old is now
an endeavour to find a reasoned basis for charitable action.
Pauperism is recognized. “Never was the greed of beggars greater
than it is now. . . . They want to empty the purses of the poor,
and not to minister to the need, that they may have their daily
bread which they ask for more. With lies about their lives they ask
for further sums of money.” “A method in giving is necessary.” But
in the suggestions made there is little consistency. Liberality is
unlimited, but prudent; and though a greater severity is implied
it was a mean of quantity, and not that rightly tempered
mean which is the harmony of opposing moods. The poor are not
to be sent away empty. Those rejected by the church are not to be
pressed with “no alms” but “they must be supplied if they are in want.
The method giver is “hard towards none, but is free towards all.”
Consequently none are refused, and no account is taken of the regeneration that may
spring up among the beggars sent from them; and the old doctrine
of the oblongates is only reaffirmed. Even a method is often
true on the other hand, the churches would probably
be constant centres of almsgiving and relief; and then, further,
when the Roman municipal system had decayed, each citizen
(as in Charlemagne’s time, 742-814) was required to support his
own dependants—a step suggestive of much after-history.

In Constantinople the pauperism seems to have been extreme.
The corn supplies of Africa were diverted there in great part
when it became the capital of the empire. This must have
left to Rome a larger scope for the development of the civic-
religious administration of relief. St Chrysostom’s sermons give
no impression of the rise of any new administrative force, alike
sagacious and dominant. The appeal to give alms is constant,
but the positive counsel on charitable work is nil. The people had
the annona civica, and imperial gifts, corn, allowances (salaria) from the treasury granted for the poor and needy,
and an annual gift of 50 gold pounds (rather more than £140)
for funerals. Besides these there were many institutions, and
the begging and the almsgiving at the church doors. “The
land could not support the lazy and valiant beggars.” There
were public works provided for them; if they refused to work
on them they were to be driven away. The sick might visit the
capital, but must be registered and sent back (A.D. 382); the
sturdy beggar was condemned to slavery. So little did alms
CHARITY AND CHARITIES

of Phrygia, I. i. 119) an inscription mentions a bequest (possibly by a Christian) to the council (ἐνδικοστάτου) of the presbyters of the dyers in purple for a ceremonial, on the condition that, if the ceremony be neglected, the legacy shall become the property of the gold for the case of murders; and in the same inscriptions (Orelli 4420) for a more permanent sacrifice, on the condition that it be not performed, double the cost be paid to the treasury of the corn
supply (fisco stationis annonnae). No unauthorized collegia could receive a legacy. "The law recognized no freedom of association."

No other private persons or institutions could acquire property of its own. Property could only be left to an authorized juristic person, being a municipality or a collegium. But while the closing of poverty was considered from a broader standpoint, there was no general deal to ensure that even a small charitable society or a room in a house should have been executed by the annona civilis. The pueri alimentarii (see above) were considered to hold their property as part of the fiscus or property of the state. Plyn (Ep. v. 18), seeking a method of endowment, transferred property in land to the state or to public property, and then took it back again subject to a permanent charge for the aid of children of freemen. By the law of Constantine and subsequent laws no such devices were necessary. Widows or deaconesses, or virgins dedicated to God, or monasteries (a.d. 455), could leave bequests to a charity, or for educational purposes (martyriae monasterii or to a priest or a monk, or to the poor in any shape or form, in writing or without it. Later (a.d. 475) donations of every kind, to the person of any martyr, or apostle, or prophet, or the holy angels, for building an oratory were provided. This widest latitude in the field of charitable works seems to have come to an end. In a.d. 478, the bishop of Rome, the privatisation of monasteries in the empire was forbidden, and the law remains in force down to our days. The law of anti-parochial, or St Gregory, which was scarcely published, even in the field of charitable foundations, was not really suspended; and the same rule applied to infirmaries (πονηρωτείας) and poor-houses (πωρωτείας)—the bishop or steward being competent to appear in behalf of such cases. Later, again (a.d. 528), the law was more solidified (quia sancto, &c.), were made legal, though not registered; while larger sums, if registered, were also legalized. So (a.d. 529) property might be given for churches, hostel, poor-houses, infant and aged, or for some pious personage (consortium), even though not registered, and such property was free from taxation. The next year (530) it was enacted that prescription even for 100 years did not alienate church and charitable property. The broadest terms were thus made legal. "You may take an estate we left," to Christ our Lord," the church of the city or other charity might receive it as heir; "let these, the law says, belong to the holy churches, so that they may become the alimony of the poor." It was sufficient to leave property to the poor (beneficia largiorum); and hence, if a corporation (consortium) or an ecclesiastical institution was by virtue of a general rule of law." On a causa it was not necessary to confer a juristic personality. Other laws preserved or regulated alienation (a.d. 377, a.d. 530), which had been partly sanctioned and regulated by law. Thus the bishop of Rome, the legislator, had thus become the owner of large properties, with the coloni and slaves upon the estates and the allowances of civic corn (annona civilis); and (a.d. 357) it was stipulated that whatever they acquired by right or trading should be used for the service of the poor and charitable, and what was not needed they were not allowed to sell; and thus the law of 530 was a new date in the development of the poor-laws. Their grandparents had been only received from the labour of their slavers in the labour houses (ergastula) or inns (tabernae) might be considered of a profite of religion (religiones lucrum).

Thus grew up the system of endowed charities, which with certain modifications continued through the middle ages, and, though it assumed different forms in connexion with gilds and municipalities, in England it still retains, partially at least, its relation to the church. It remained the system of institutional relief parallel to the more personal almsgiving of the parish.

Monasticism, in acting on men of strong character, endowed them with a double strength of will, and to men like St Gregory it seemed to give back with administrative power the relentless firmness of the Roman. In the East it produced the turbulent soldiery of the church, in the West its missionaries; and each mission-monastery was a centre of relief. But whatever the services monasticism rendered, it can hardly be said to have furthered true charity from the social standpoint, though out of regard for the interests of its institution it may have to some degree justified this judgment. The movement was almost of necessity in large measure anti-parochial, and thus out of sympathy with the charities of the parish, where personal relations with the poor at their homes count for most.

The good and evil of it may be weighed. Monasticism working through St Augustine helped the world to realize the mood of love as the real or eternal life. Of the natural life of the world and its responsibilities, through which that mood would have borne its completest fruit, it took but little heed, except in so far as, by creating a class possessed of leisure, it created able scholars, lawyers

The degrading charities. The hospitium (hospitalium, ἡσυχοσθεία) as a centre for the reception of strangers—a religious ἡσυχοσθεία. Probably the strangers referred to in "the Teaching" were so entertained. The table of the bishop and a room in his house served as the guest-chamber, for which afterwards a separate building was instituted. In the East the Jewish charitable inn first appears, and there took place the earliest extension of institutions. There was probably a demand for an elaboration of institutions as social changes made themselves felt in the churches. We have seen this in the case of the ἅγιαστα. Similar changes would affect other branches of charitable work. The house (hospitalium, ἡσυχοσθεία) is defined as a "house of God in which strangers who lack hospitality are received" (Suicerus, Theaur.), a home separated from the church; and round the church, out of the primitive ἡσυχοσθεία of early Christian times and the entertainment of strangers at the houses of members of the community, would grow up other similar charities. In a.d. 321 licence was given by Constantine to leave property to the Church. The churches were thus placed in the same position as pagan temples, and though subsequently Valentinian (A.D. 379) withdrew the permission on account of the shameless legacy-hunting of the clergy, in that period much was to be done for the religious and charitable use of funds. In the same period grew to its height the passion for monasticism. This affected the parish and the endowed charity alike. Under its influence the deacon as an almoner tends to disappear, except where, as in Rome, there is an elaborate system of relief. Nor does it seem that deaconesses, widows, and virgins continued to occupy their old position as church workers and alms-receivers. Naturally when marriage was considered in itself an evil, perhaps to be tolerated, but still degrading to human nature, and (A.D. 385) the marriage of the clergy was prohibited, men, except those in charge of parishes, and women would join regular monastic bodies; the deacon, as almoner, would disappear, and the "widows" and virgins would become nuns. Thus there would grow up a large body of men and women living segregated in institutions, and forming a leisure class able to superintend institutional charities. And now two new officers appear, the λειμοσνώριος or almoner and the ἐκονομός or steward (already an assistant treasurer to the bishop), who superintend and distribute the alms and manage the property of the institution. (In the first six books of the Apost. Constit., A.D. 300, these officers are not mentioned.) In these circumstances the hospitalium or hospital (ἐσχοστήματα, καραγωγίς) assumes a new character. It becomes in St Basil's hands (A.D. 330-379) a resort not only for those who "visited the house time to time as they pass by, but also for those who need some treatment in illness." And round St Basil at Caesarea there springs up a colony of institutions. Four kinds principally are mentioned in the Theodosian code: (1) the guest-houses (ἐσχοστήματα); (2) the poor-houses (πωρωτείας), where the poor (mendici) were housed and maintained (the πωρωτεία was a general term also applied to all houses for the poor, the aged, orphans and sick); (3) there were orphanages (δορυφοροφεία) for orphans and wards; and (4) there were houses for infant children (βρεφοπροφεία). Thus a large number of endowed charities had grown up. This new movement it is necessary to consider in connexion with the law relating to religious property and bequests, in its bearing on the rule of the monasteries, and in its effect on the family.

The sanctified property (res sacra) of Roman law consisted of things dedicated to the gods by the pontiff with the approval of the civil authority, in turn, the people, the senate and the emperor. Things so constituted were inalienable. Apart from this in the empire, the municipalities as they grew up were considered "juristic persons," who were entitled to receive and hold property. In a similar position were authorized collegia, amongst which were the mutual aid societies referred to above. Christians associated in these societies would leave legacies to them. Thus (W. M. Ramsey, Cities and Bishops
and administrators, and disciplined the will of strong men. It had no power to stay the social evils of the day. Unlike the friars, at their best the monks were a class apart, not a class mixed up with the people. So were their charities. The belief in poverty as a fixed condition—inviolable and ever to be alleviated without any regard to science or observation, subjected charity to a perpetual stagnation. Charity requires belief in growth, in the sharing of life, in the utility and nobility of what is done here and now for the betterment of the race. If the Church had any belief in this, it had no thought of this. It was based on a belief in the evil of man which was a basis on which that root could spring no social charity. Economic difficulties also fostered monasticism. Gold was appreciated in value, and necessities were expensive, and the cost of maintaining a family was great. It was no easy feat for a woman to bring up children when the population was decreasing; and in spite of church feeling Marjorian (A.D. 461) had to forbid women from taking the veil before forty, and to require the remarriage of widows, subject to a large forfeit of property. Belief, which was not so prepared for this situation, and which religious belief, could alone. The church that with so fine an intensity of purpose had fostered charity and marriage was betraying its trust. It was out of touch with the prudential unit of social life, the child-school of dawning habits and ever-moving economy of the home. It preserved the breadth and beauty in the outer Greek sense of the word. The home and its associations no longer retained their prominence. In the extreme advocacy of the celibate state, the honourable development of the married life and its duties were deprecated and sometimes, one would almost say, despised. Then, if any, religious belief, could alone. The church that with so fine an intensity of purpose had fostered charity and marriage was betraying its trust. It was out of touch with the prudential unit of social life, the child-school of dawning habits and ever-moving economy of the home. It preserved the breadth and beauty in the outer Greek sense of the word. The home and its associations no longer retained their prominence. In the extreme advocacy of the celibate state, the honourable development of the married life and its duties were deprecated and sometimes, one would almost say, despised. Then, if any, religious belief, could alone. The church that with so fine an intensity of purpose had fostered charity and marriage was betraying its trust. It was out of touch with the prudential unit of social life, the child-school of dawning habits and ever-moving economy of the home. It preserved the breadth and beauty in the outer Greek sense of the word. The home and its associations no longer retained their prominence.

We may ask then, What were the results of charity at the close of the period which ends with St Gregory and the founding of the medieval church?—for if the charity is reflected in the social good the results should be manifest. Economic and social conditions were adverse. With lessened trade the middle class was decaying (Dill, Roman Society in the Last Century of the Western Empire, p. 264) and a selfish aristocracy rising up. Municipal responsibility had been taxed to extinction. The public service was corrupt. The rich evaded taxation, the poor were oppressed by it. There were laws upon laws, endeavours to underpin the framework of a decaying society. Society was bankrupt of skill—and the skill of a generation has a close bearing on its charitable administration. While hospitals increased, medicine was unprogressive. There were miserable years of famine and pestilence, and constant wars. The care of the poor, the classical (Roman, and poor, the Chrisitan) church. The church strengthened the feeling of kindness for those in want, widows, orphans and the sick. It lessened the degradation of the "actresses," and, co-operating with Stoic opinion, abolished the slaughter of the gladiatorial shows. It created a popular "dogmatic system and moral discipline," which paganism failed to do; but it produced no prophet of charity, such as enlarged the moral imagination of the Jews. It ransomed slaves, as did paganism also, but it did not abolish slavery. Large economic causes produced that great reform. The serf attached to the soil took the place of the slave. The almsgiving of the church by degrees took the place of anona and spolita, and it may have created pauperism. But dependence on almsgiving was at least an advance on dependence founded on a civic and hereditary right to relief. As the colonus stood higher than the slave, so did the pauper, socially at any rate, free to support himself, exceed the colonus. Bad economic conditions and traditions, and a bad system of almsgiving, might enthrall him. But the way, at least, was open; and thus it became possible that charity, working in alliance with good economic traditions, should in the end accomplish the self-support of society, the independence of the whole people.

Part V.—Medieval Charity and its Development

It remains to trace the history of thought and administration in relation to (1) the development of charitable responsibility in the parish, and the use of title and church property for poor relief; and (2) the revision of the theory of charity, with which are associated the names of St Augustine (354–409), St Benedict (480–547), St Bernard (1091–1153), St Francis (1182–1226), and St Thomas Aquinas (1225–1274). (1) There followed in reference chiefly to England, a sketch of the development of the charity under feudalism, the charities of the parish, the monastery and hospital—the medieval system of endowed charity; the rise of guild and municipal charities; the decadence at the close of the 15th century, and the statutory endeavours to cope with economic difficulties which, in the 16th century, led to the establishment of statutory seidom and the poor-laws. New elements affect the problem of charity in the 17th and 18th centuries; but it is not too much to say that almost all these headings represent phases of thought or institutions which in later forms are interwoven with the charitable thought and endeavours of the present day.

Naturally, two methods of relief have usually been prominent: relief administered locally, chiefly to residents in their own homes, and relief administered in an institution. At the time of Charlemagne (742–814) the system of parochial charity was parochial, consisting principally of assistance at the home. After that time, except probably in England, the institutional method appears to have predominated, and the monastery or hospital in one form or another gradually encroched on the parish.

The system of parochial charity was the outcome, apparently, of the influence of the Church on the local lord, the ecclesiastical nature of the church fund, and the existence of a responsible organization of relief. It resulted in what might almost be called an ecclesiastical poor-law. The affairs of a local church or monastery were administered by a bishop. To deal with the outlying districts he delegated the function and the wealth of the church to the parish. Church property was the patrimony of the poor. In the 4th century (IV. Council of Carthage, 398) the names of the clergy were entered on a list (matricula or caxum), as were also the names of the poor, and both were relieved from the church their daily portion (cf. Ratzinger, Geschichfe der kirchlichen Armenpflege, p. 117). There were no expenses for building. Before the reign of Constantine (306) very few churches were built (Ratzinger, p. 120). Thus the early church as has been said, was chiefly a charitable society. By degrees the property of the church was very largely increased by gifts and bequests, and in the West before St Gregory's time the division of it for four separate purposes—the support of the bishop, of the clergy, and of the poor, and the church and for the next two centuries, further promotion and decentralization. Apart from any special gifts, there was thus created a separate fund for almsgiving, supervised by the bishop, consisting of a fourth of the church property, the oblations (mostly used for the poor), and the tithe, which at first was used only for the poor. The organization of the church's charge was extended. The church once established in the chief city of a district would become in turn the mother church of other neighbourhoods, and the bishop or priest of the mother church would come to exercise supervision over them and give them all dependent on him—all that is, upon his freehold estate (ailidium), and no one was to presume to give...
To this Augustinian thought led the way. "Christianity was asceticism and the city of God" (Harnack vi. 6). A new religious feeling took possession of the general mind, a regard and adoration of the Eternal, the historic Christ. Of this St Bernard was the expositor. "Beside the sacramental Christ the image of the historical took its place,—majesty in humility, innocence in penal suffering, life in death." The spiritual and the sensuous were intermingled. Dogmatic formulæ fell into the background. The picture of the historic Christ led to the realization of the Christ according to the spirit (sæculæ rævæa). Thus St Bernard carried forward Augustinian thought; and the historic Christ became the "sinless man, approved by suffering, to whom the divine grace, by which He lives, has lent such power that His image takes shape in other men and incites them to corresponding humility and love."

Humility and poverty represented the conditions under which alone this spirit could be realized; and the poverty must be spiritual, and therefore self-imposed ('wilful,' as it was afterwards called). This led to practical results. Poverty was not a social state, but a spiritual; and consequently the poor generally were not the tertiarii of the pauperes Christi, but those who, like the men who had taken penance, had not committed their promises followed later the doctrine that gifts to the church were not gifts to the poor, as once they had been, but to the religious bodies. The church was not the church of the poor, but of the poor in spirit. But the immediate effect was the belief for a time, apparently almost universal, that the salvation of society would come from the monastic orders. By their aid, backed by the general opinion, the secular clergy were brought back to celibacy and the monasteries newly disciplined. But charity could not thus regain its touch of life and become the means of raising the standard of social duty.

Next, one amongst many who were stirred by a kindled inspiration, St Francis turned back to actual life and gave a new reality to religious idealism. For him the poor were once again the pauperes Christi. To follow Christ was to adopt the life of "evangelical poverty," and this was to live among the poor the life of a poor man. The follower was to work with his hands (as the poor clergy of the early church had done and the clergy of the early English church were exorted to do); he was to receive no money; he was to earn the actual necessities of life, though what he could not earn he might beg. To ask for this was a right, so long as he was bringing a better life into the world. All in excess of this he gave to the poor. He would possess no property, buildings or endowments, nor was his order to do so. The fulness of his life was in the complete realization of it now, without the cares of property and without any fear of the future. Having a definite aim and mission, he was ready to accept the want that might come upon him, and his life was a discipline to enable him to suffer it if it came. To him humility was the soul making itself fit to love; and poverty was humility expanded from a mood to a life, a life not guarded by seclusion, but spent amongst those who were actually poor. The object of life was to console the poor—those outside all monasteries and institutions—the poor as they lived and worked. The movement was practically a lay movement, and its force consisted in its simplicity and its moral effect on those around it. Soon, as was paraphrased: Life was to be the teacher. The brothers thus become men of action, and afterwards indeed learned, and their learning had the same characteristics. Their power lay in their practical sagacity, in their treatment of life, outside the cloister and the hospital, at first hand. They knew the people because they settled amongst them, living just as they did. This was their method of charity.

The inspiration that drew St Francis to this method was the contemplation of the life of Christ. But it was more than this. The Christ was to him, as to St Bernard, an ideal, whose nature passed into that of the contemplating and adoring beholder, so that, as he said, "having lost its individuality, of itself the creature could no longer act." He had no impulse but the Christ impulse. He was changed. His identity was merged in that of Christ. And with this came the conception of a...
CHARITY AND CHARITIES

Gracious and finely ordered charity, moving like the natural world in a constant harmonious development towards a definite end. The mysticism was intense, but it was practical because it was intense. In that lay the strength of the movement of the true Franciscans, and in those orders that, whether called heretical or not, followed them—Lollards and others. Religion thus became a personal and original possession. It became individual. It was inspired by a social endeavour, and for the world at large it made of charity a new thing.

St Thomas Aquinas took up St Bernard's position. Re-nunciation of property, voluntary poverty, was in his view also a necessary means of reaching the perfect life; and the feeling that was akin to this renunciation and prompted it was charity. "All perfection of the Christian life was to be attained according to charity," and charity united us to God.

In his system elaborated by St Thomas Aquinas two lines of thought are carried on, and to hand it is argued that the good act is an act which, in relation to its object, wholly serves its purpose; and thus the measure of goodness (Prima Secundae Summae Theolog. Q. xviii. 2) is the proportion between the end and the means. On the other hand, it is argued that the twofold law, human reason and eternal reason. From the point of view of the former the cardinal factor is desire, which, made proportionate to an end, is love (amor); and, seeking the good of others, it lessens the desire of itself, by a cause of satisfaction. Thus, the twofold law, human reason and eternal reason.

Thus, the twofold law, human reason and eternal reason. From the point of view of the former the cardinal factor is desire, which, made proportionate to an end, is love (amor); and, seeking the good of others, it lessens the desire of itself, by a cause of satisfaction.

It is this twofold law which is applicable to Aristotle and nature, the other for Christian tradition and theology. We have thus a duplicate theory of thought and action throughout, both rational and theologic virtues, and a duplicate beatitude or state of happiness corresponding to the two. But although there are two principles, the chief and root of the theologic virtues of faith and hope, and on the other side participative. As wood ignited participates in the natural fire, so does the individual in these virtues (I. II. xxxli. 1). Charity is a kind of friendship toward all, and this is fixed by another act, the spiritual reigns, the chief and root of the theologic virtues of faith and hope, and the rational virtues depend.

They are not degrees of charity as they are of (amor) love, but charity gives purpose, order and quality to the whole life of the person. This is the case in virtue, for instance, beneficence. The counterpart of charity in life is pity (misericoria), the compassion that moves us to supply another's want (summa religiosis Christianae in misericordia consituit quantum ad exteriores opera). It is, however, emotion, not a virtue, and must be regulated like any other emotion (c. passim et non virtus. Hier actum motus potest esse secundum rationem regulaturas, II. II. xxxi. 3). Thus we pass to alms, which are the instrument of pity, and which move the charity of the heart, and the alms are given in the name of the recipient (vestio, misericordia), the chief and root of the theologic virtues of faith and hope, and the rational virtues depend.

An extreme abstraction is required to bring us to the alms of charity. Charity, that is, alms, is of two kinds in social life: the charitable and the charitable givers. The charitable are those who do not distribute alms to all, but only to those who are in need. The charitable givers are those who give not merely what they have, but the very means of life, and not merely goods, but even their own person. Thus, the charitable and the charitable givers.

The charitable give in need, not only to the poor, but also to those who are not poor, but who have had their means taken from them, and whose means are insufficient for their wants. The charitable givers are those who give not merely what they have, but the very means of life. This is the case in the charitable and the charitable givers. Thus, the charitable and the charitable givers.

Endowments. The charitable and the charitable givers. Thus, the charitable and the charitable givers. Thus, the charitable and the charitable givers. Thus, the charitable and the charitable givers.

On this foundation was built up the classification of acts of charity, which in one shape or another has a long social tradition, and which St Thomas quotes in an elaborated form—the seven spiritual acts (consule, carpe, doce, solare, remotile, fer, ora), counsel, sustain, teach, console, save, pardon; but the seven corporals (vestio, pote, cibo, redimio, teto, colligo, condo) I clothe, I give drink to, I feed, I free from prison, I shelter, I assist in sickness, I bury (II. II. xxvii. 2). These in subsequent thought became "good works," and availed for the after-life, bringing with them definite boons. Thus charity was linked to the system of indulgences. The bias of the act of charity is made up of the act of charity. Primarily the benefit is to the one who gives the charity. The benefit is to the one who gives the charity. The benefit is to the one who gives the charity.

The simplicity of the definition of charity, as which, from as which, a well-considered art, its freshness springs out and its good effects result, is falsified at the outset. The thought that should be wholly concerned in the fulfilment of a definite purpose is diverted from it. The deed itself, apart from the outcome of the deed, is highly considered. An extreme abstraction is required to bring us to the alms of charity. Charity, that is, alms, is of two kinds in social life: the charitable and the charitable givers.

There are, then, these three lines of thought. That of St Bernard, who invigorated the monastic movement, and helped to make the monastery or hospital the centre of charitable relief. That of St Francis, who, by regular and secular clergy alike, revived and reinvigorated the conception of charity, and gave it once more the reality of a social force, knowing that it would find a freer scope and larger usefulness in the life of the people than in the religious aristocracy of monasteries. And that of St Thomas Aquinas, who, analyzing the problem of charity and almsgiving, and associating it with definite groups of works, led to its taking, in the common thought, certain stereotyped forms, so that its social aim and purpose were ignored and its power for good was neutralized.

We have now to turn to the conditions of social life in which these thoughts fermented and took practical shape. The population of England from the Conquest to the 14th century is estimated at between 1½ and 2½ millions. London, it is believed, had a population of about 40,000. Other towns were small. Two or three of the larger had 4000 or 5000 inhabitants. The only substantial body of a village, apart perhaps from the manor-house, was the church, used for many secular as well as religious purposes. In the towns the mud or wooden huts sheltered a people who, accepting a common poverty, traded in little more than the necessaries of life (Green, Town Life in the 15th Century, i 13). The population was stationary. Famine and pestilence were of frequent occurrence (Creighton, Epidemics in Britain, p 19), and for the careless there was waste at harvest-time and want in winter. Hunger was the drill-sergeant of society. Owing to the hardship and penury of life infant mortality was probably very great (Blashill, Sutton in Holderness, p 123). The 15th century was, however, "the golden age of the labourer." Our problem is to ascertain what was the service of charity to this people till the end of that century. In order to estimate this we have to apply tests similar to those we
applied before to Greece and Rome and the pre-medieval church.

The Family.—Largely Germanic in its origins, we may perhaps see in it an element in the English race which is of Germanic origin. They had the home virtues. They had a high regard for chastity, and respected and enforced the family tie. The wife was honoured. The men were poor, but when the actual pressure of necessity came, they fought, and against the odds or by means of gamblers. Much toll fell upon the wife; but slavery was rather a form of tenure than a Roman bondage. As elsewhere, there was in England the joint family or household. (Pollock and Maitland, English Land Law, p. 30.) In 1107, the community was, or should be, under some lord; for the lordless man, was, like the wanderer in Homer, who belonged to no phratry, suspected and dangerous, and his kinsfolk might be required to find a protector against the person of the community. But it had a certain complexion; there were grades amongst the unfree, and the general advance to freedom was continuous. By the 9th century the larger amount of the slavery was bondage by tenure. In the reign of Edward I., although the large half of the population was unfree, ‘yet the serf, notwithstanding the fact that he was his lord’s chattel, was free against all save his lord. A century later (1381) villenage—that is payment for tenancy by service, instead of by quit-rent—had been extinguished.

The Manor.—In social importance, next to the family, comes the manor, and its control over the individual was for one side. It was “an economic unit,” the estate of a lord on which there were associated the lord with his demesne, tenants free of service, and villeins and others, tenants by service. All had the use of land, even the villeins. The estate was regulated by a moral code. The king, as the superior of the lord of the manor, had the right of representation and the right to be consulted. The value of the estate depended on the labour available for its cultivation, and the cultivators were the unfree tenants. Hence the lord, through the manor court, required an income or a find, and the now or then left the manor; and similarly, if a villein died, his wife might have to remarry or pay a fine. Thus the lord reacquired a servant and the widow and her family were maintained. The courts, too, fixed personal rights and economic rights. A villein could not leave the greater part of his farm to his wife, without the lord’s consent. Hence, villeins were able to equalize them in a measure and neutralize some of the effects of scarcity. In this way, till the reign of Edward I., and, where the manors remained active, till much later, a self-supporting social condition made any systematic public or charitable relief unnecessary.

The Parish and the Tithe.—The conversion of England in the 7th century was effected by bishops, accompanied by itinerant priests, who made use of conventual houses as the centres of their work. The parochial system was not firmly established till the 10th century (970). Then, by a law of Edgar, a man who had a church on his own land was allowed to pay a third of his tithe to the lord of the land. A century later, a portion of the gift was to go to the poor with any surplus; and in order to have larger means of helping them, the priests were urged to work themselves, according to the ancient canons of the church (cf. Labbeus, IV. Concil. and Acts, 1267). The tithes were used by the Poor Clares, the Poor Premonstratensians, and the rest of the clergy, as is shown by acts of Richard II. and Henry IV., by which it was enacted that, if parochial tithes were appropriated to a monastery, a portion of them should be assigned to the poor of the parish. At a very early date (1267) quasi-compulsory charges in the nature of a rate were imposed on parishioners for various church purposes (Pollock and Maitland, i. 604), though in the 14th and 15th centuries a compulsory church rate was seldom made. Collections were made by the parish clerks, by clergymen, and by the sheriffs for the poor. The idea of the Poor Law is clearly shown by acts of Richard II. and Henry IV., by which it was enacted that, if parochial tithes were appropriated to a monastery, a portion of them should be assigned to the poor of the parish. At a very early date (1267) quasi-compulsory charges in the nature of a rate were imposed on parishioners for various church purposes.

The Monasteries.—As Christianity spread monasteries spread, and each monastery was a centre of relief. Sometimes they were established, like St Albans (970), for a hundred Benedictine monks; sometimes they were assigned to the regular clergy of the monastery, as the Augustinians (1147); sometimes they were granted such special purpose, like the abbey of Croyland (reorganized 946), which, becoming exceeding rich from its divorum parvum, or almonry, relieved the whole country round so that prodigious sums were available. Reliefs were, however, required, and the sum of £140 16s. 8d. was given away in doles. But documents seem to prove (Denton, England in Fifteenth Century, p. 245) that the relief generally given by monasteries was much less than is usually supposed.

The general system may be described (cf. Rule, St Dunstan. Cont. Archp. p. 42, Dugdale: J. B. Clark, The Observances, Augustinian Priory, Barnwell; Abbot Gasquet, English Monastic Life). The monasteries were housed men of the third estate, were still in charge. He was to be prudent and discreet in the distribution of his doles (portiones) and to relieve travellers, palmer’s, chaplains and mendicants (mendicantes, apparently the beggars recognized by Numbers by being fed), as they had been in the age of chivalry when the pilgrim was a knight. He had a store of goods and other articles to give away as presents to widows, orphans and poor clerks. He also provided the Maundy gifts and selected the poor for the washing of feet. He was thus a social, economic, and religious factor, not merely a giver of comfort and warm to the sick. In the almoner’s office was a standing protest against the moral sufficiency of the family life. On the other hand, amongst them were the brothers and sisters who visited the poor in their homes, who were allowed more or less to be self-supporting, who visited the hospitals and perhaps to the leper hospital, and thus performed the charitable offices not only in the monasteries, but in the hospitals, as well. The hospitals, however, mainly performed secular charitable offices, and were not the places for the religious life. The religious life was more monastic, and the patient was cared for by the religious, whether a monk or a nun, who did the work of relieving the poor and the sick.

The hospitals were mostly in the towns, and their purpose was the relief of the poor and the sick. They were the centres of relief, chiefly casual relief. They were mostly "magnificent hosteries." (3) They stood outside the parish, and they weakened the organization and hampered its development.

By the 16th century, the hospitals had become more important than the monasteries, and the monasteries had become more important to the religious life than the hospitals. The hospitals led to a large increase in the number of hospitals and hospital orders. To show how far they covered the field in England two instances may be quoted. At Canterbury (Creighton, Epidemics, p. 87) there were hospitals for lepers, and there were hospitals for the poor for lepers and for the poor, in 1537. At London (Hoskin, pp. 81 and 82), there were hospitals for the poor, but not for the lepers. The word "leper" is often used to indicate another class of diseases applied to many diseases other than leprosy. There were hospitals for the lepers and the leprous, and the disease was not considered contagious. The hospitals in its modern sense was but slowly created. Thus St Bartholomew’s in London was founded (1123) for a master and brethren, and the entertainment of poor diseased persons till they got well; of distressed women big with child till they were able to go abroad; and for the maintenance, until the age...
of seven, of all such children whose mothers died in the house. St Thomas's (rebuilt 1228) had a master and brethren and three lay sisters, and 40 beds for poor, infirm and impotent people, who had also victual andiring. There were hospitals for many special purposes—as for the blind, for instance. There were hospitals of St Nicholas for the leprous, the conditions of admission were: promise or vow of continence, participation in prayer, the abandonment of all business, the inmate's property at death to go to the house. This may serve as an example. The master was usually one of the regular clergy. (9) Decline of the Hospitallers. In addition to 64 monasteries and 90 "colleges" and many charities, Henry V, 1348 re-established 110 hospitals (Speed's Chronicle, p. 778). The numbers seem small. In the economic decline at the end of the 15th and beginning of the 16th centuries many hospitals may have lapsed.

In the 15th century the towns grew in importance. First the wool trade and then the cloth trade flourished, and the English developed a large shipping trade. The towns grew up like "little principalities"; and for the advancement of trade, gilds, consisting alike of masters and workmen, were formed, which endeavoured to regulate and then to monopolize the market. By degrees the corporations of the towns were worked in their interests, and the whole commercial system became restrictive and inadaptable. Meanwhile the towns attracted newcomers; freedom from feudal obligations was gained with comparative ease; and a new gilds was congregating, a population of inhabitants not qualified as burgurers or gild members, women, sons living with their fathers, menial servants and apprentices. There was thus an increasing restriction imposed on trade, coupled with a growing gilds. Naturally, then, lay charities sprang up for members of gilds, and for burgurers and for the commonalty. Men left estates to their gilds to maintain decayed members in hospitals, almshouses or otherwise, to educate their children, portion their daughters, and to assist their widows. The middle-class trader was thus in great measure insured against the risks of life. The gilds were one sign of the new temper and wants of burgurers freed from feudalism. Another sign was a new standard of manners. Rules and saws, Hesiodic in their tone, became popular—in regard, for instance, to such a question as "how to enable a man to live on his means, and to keep himself and those belonging to him." The boroughs established other charities also, hospitals and almshouses for the people, a movement which, like that of the gilds, began very early—in Italy as early as the 4th century. They sometimes gave outdoor relief also to registered poor (see below, p. 41), and they had in large towns (and in the larger boroughs) houses set up by the mayor and aldermen, thus taking over a duty that previously had been one of conspicuous importance in the church. As early as 1357 in Westphalian towns there was a rough-and-ready system of Easter relief of the poor; and in Frankfort in 1437 there was a town council of almshouses with a systematic programme of relief (Ratzinger, p. 352). Thus at the close of the middle ages the towns were gradually assuming what had been charitable functions of the church.

While a new freedom was being attained by the labourer in the country and the burgurer in the town, the difficulty of obtaining a sufficient supply of labour for agriculture must have been constant, especially at every visitation of plague and famine. In accordance with a general policy of state regulation which was to control and supervise the industry, agriculture and poor relief and to repress vagrancy by gilds and houses of correction, the state stepped in as arbiter and organizer. By Statutes of Labourers beginning in 1351 (25 Edw. III. 135), it aimed at enforcing a settled wage and restraining migration. From 1351 it endeavoured to suppress mendicancy, and in part to systematize it in the interest of informal and aged mendicants. Each series of enactments is the natural complement of the other. In the main their signification, from the point of view of charity, lies in the fact that they represented a persistent endeavour to present special unsettlement and in part the distress which unsettlement causes, and which vagrancy in some measure indicates, by keeping the people within the ranks of recognized dependence, the settled industry of the crafts and of agriculture, or forcing them back into it by fear of the gaol or the stocks. The extreme point of this policy was
reached when by the laws of Edward VI. and Elizabeth the "rogue, vagabond or sturdy beggar" was branded with an R on the shoulder and hanged over as a public warning for a period to any one who would take him. On the other hand, it was desired that relief should be a means of preventing migration. In any time of general pressure there is a desire to organize mendicity, to prevent the wandering of beggars, to create a kind of settled poor, distinguished from the rest as infirm and not able-bodied, and to keep these at least at home sufficiently supported by local and parochial relief; and this, in its simpler form all the world over, has in the past been by response to public begging. The argument may be summed up thus: We cannot have begging, which implies that the beggar is cared for by no one, belongs to no one, and therefore throws himself on the world at large. Therefore, if he is able-bodied he must be punished as unsocial, for it is his fault that he belongs to no one; or we must make him some one's dependant, and so keep him; or if he is infirm, and therefore of no service to any one—if no one will keep him—we must organize his mendicity, for such mendicity is justified. If he cannot dig for the man to whom he does or should belong, he must beg. Then out of the failure to organize mendicity for relief of itself is all charitable relief. A new law springs up in which, afterwards associated with the provision of employment, will, it is hoped, make relief in some measure remedial by increasing its quantity by means of compulsory levies. This argument, which combined statutory wage control and statutory poor relief, seems to have been firmly hedged in the English legislative mind for more than two centuries, from 1351 till after 1600; and until 1834 these two series of laws effectively reduced the English labourer to a new industrial dependence. To people imbued with ideas of feudalism the way of escape from villegaignon seemed to be not independence, but a new reversion to it.

Many elements produced the social and economic catastrophe of the 16th century, for the condition into which the country fell can hardly be considered less than a catastrophe.

The decay of Mendicity. With the growing independence of the people there was created after the 15th century an unsettled "masterless" class, a residue of failure resulting from social changes, which was large and important enough to call for legislation. In the 15th century, the gold of the English exchequer, the towns increased and flourished. Both town and country did well. At the end of the century came the decay. The measure of the strain, when perhaps it had reached its lowest level, is indicated by the following comparison: "The cost of a peasant's family of four in the early part of the 14th century was £3 4s. 9d.; after 1540 it was £8" (Rogers, Hist. of Agric. and Prices, iv. 756).

The cause of this has now been fairly investigated. The value of land in the 13th century generally depended chiefly on "the head of labour" retained upon it. Its fertility depended on mainœuvre (manure). To keep labour upon it was therefore the aim of the lord or owner. The enclosing of lands for sheep began early, and in the time of Edward III., in the great days of the woolsloppe, must have been extensive. So long as the demand for the exportation of wool, and then for its consumption at home in the cloth trade, continued, every acre was brought into production, and the surplus produced was the more to be considered as a grievance. Even before the reign of Henry VII., with the decay of trade, the towns decayed, and their population in some cases diminished extraordinarily. This reacted on the country, where the ground that had been ploughed up had been abandoned, and was no longer ploughed, to support their retainers. In Henry VIII.'s time the lands of the religious houses were confiscated. Worked on old lines, the custom of tillage remained in force on them. Accordingly, when these lands fell into private hands there was a tendency to get back to the condition that they should be tilled as heretofore. The condition was evaded by the new owners, and the disbandment of farm labourers went on apace. In England and Wales these changes, it is supposed, took centuries, but a shorter time in Ireland. Between 1490 and 1520 the estimates be correct, or rather a third of the best land in the kingdom. With towns decaying, the effect of this must have been terrible. "What were really "iatuendi" were created, "great lands", "or "interventures", losses of a mile or two elsewhere, destroying thereby not only the farms and cottages within the same circuits, but also the towns and villages adjoining." A herdsmen and his wife took the place of eighteen to twenty-four farm hands. The people thus set wandering could only join the wanderers from the decaying towns. At the same time the economic difficulty was aggravated by a new patron or commercial greed; and once more the land question—the absorption of property into a few hands instead of its free exchange—led to lasting social demoralization. Eight years after the execution of the Somerset, the 13th (1543) act for the first time raised the wages. In this the prices were arbitrarily raised, and wages were increased nominally; but nevertheless the price of necessaries was "so enhanced" that neither "the poor labourers could live with their wages that is limited by your grace's laws, nor the poor labourer can rid himself of the old immoral price" (Lamond, The Communistw of this Realm of England, p. xlvii.).

No social reformation, such as the charitable instincts of Wycliffe, More, Hales, Latimer and other men suggested, was attempted, or if attempted, it had already been stopped. In towns the organization of the poor had become restrictive, exclusive and inadaptable, or, judged from the moral standpoint, uncharitable. There had been a time of plenty and extravagance, of which in high quarters the famous "Golden Age" is the residue; the gold of the English labourer was at the same time the frequently observed law of social economics, as the advance in wages and their purchasing power in the earlier part of the 15th century had not been accompanied by a simultaneous advance in self-sufficing and intelligent expenditure, it resulted in a lessened competence and industrial ability on the part of the workmen, and thus in the end produced pauperism.

The poverty of the country was very great in the reigns of Edward VI. and Elizabeth. Adversity then taught the people new manners, and households became more simple and thrifty. In the reign of James I., with enforced economy and thrift, a "slow but substantial improvement in agriculture" took place, and a new growth of commercial enterprise. The vigour of the municipalities had abated, so that in Henry VIII.'s time they had become the very humble servants of the government; and the government, on the other hand, had become strongly centralized—in itself a sign of the general withdrawal of self-sustaining activity in all administration, in the administration of charitable relief no less than in other departments. A system of endowed charities had been built up, supported chiefly by rents from landed property. These now had disappeared, and thus the means of relief, which Edward VI. and Queen Elizabeth might have utilized at a time of general distress, had been supplanted by the acts of their predecessors. The civil independence of the monasteries and religious houses might have been justified, possibly, when they were engaged in missionary work and were instilling into the people the precepts of a higher moral law than that which was in force around them. But afterwards, as the ability and intelligence of the community increased, their privileges became more and more antagonistic to charity, and tended to create a non-social and even anti-social ecclesiastical democracy actuated by aims and interests in which the general good of the people had little or no place. There was a growing alienation between religious tradition and secular opinion, as Lollardism slowly permeated the thought of the people and led the way to the Reformation. While this alienation existed no national system of charity, civic and yet religious, could be created. But worse than all, the ideal of charity had been degraded. A self-regarding system of relief had superseded charity, and it was productive of nothing but alms, large or small, isolated and unmethodic, given with a wrong bias, and thus almost inevitably the "artificial charity", the guild, and the "adverumparum" relief—"charity"—not relief—indeed seemed to have left the world. The larger issues were overlooked. Then the property of the hospitals and the gilds was wantonly confiscated, though the poor had already lost that share in the revenues of the church to which at one time they were admitted to have a just claim. A new beginning had to be made. The obligations of charity had to be revived. A new organization of charitable relief had to be created, and that with an empty exchequer and after a vast waste of charitable resources. There were signs of a new congregational and parochial energy, yet the task could not be entrusted to the religious bodies, divided and disunited as they were. In their stead it could be imposed only on some authority which represented the general community, such as municipalities; and in spite of the centralization of the government there seemed some hope of creating a system of relief in connexion with them. They were tried, and, very naturally, failed. In the poverty of the time it seemed that the poor could be relieved only by a
compulsory rate, and the administration of statutory relief naturally devolved on the central government—the only vigorous administration was left in the central control. The government might indeed have adopted the alternative of letting the industrial difficulties of the country work themselves out, but they had inherited a policy of minute legislative control, and they continued it. Revising previous statutes, they enacted the Poor Law, which still remains on the statute book. It could be no remedy for social offences against charity and the community. But in part at least it was successful. It helped to conceal the failure to find a remedy.

PART VI.—AFTER THE REFORMATION

During the Reformation, which extended, it should be understood, from the middle of the 14th century to the reign of James I., the groundwork of the theory of charity was being recast. The old system and the narrow theory on which it had come to depend were discarded. The recognition of charity is startling. To a very large extent charitable administration had been in the hands of men and women who, as an indispensable condition to their participation in it, took the vows of obedience, charity, and "Wilful" poverty. Now this was all entirely set aside. It was felt (see Homilies on Faith and Good Works, E&c., A.D. 1547) that socially and morally the method had been a failure. The vow of obedience, it was argued, led to a general disregard of the duties of civil and family life. Those who bound themselves by it were outside the state and did not serve it. In regard to charity the Homily states the common opinion: "How the profession of charity was kept, it is more honesty to pass over in silence and let the world judge of what is well known." As to Wilful poverty, the regulars, it is urged, were not poor, but rich, for they were in possession of much wealth. Their property, it is true, was held in communi, and not personally, but nevertheless it was practically theirs, and they used it for their personal enjoyment; and "for all their riches they might never help father nor mother, nor sisters, though they had the license of their father a brother or other head." This was the negative position. The positive was found in the doctrine of justification—the central point in the discussions of the time, a plant from the garden of St Augustine. Justification was the personal conviction of a lively (or living) faith, and was defined as "a true trust and confidence of the mercy of God through our Lord Jesus Christ, and a steadfast hope of all good things to be received at His hands." Without this justification there could be no good works. They were the signs of a lively faith and grew out of it. Apart from it, what seemed to be "good works" were of the nature of sin, phantom acts productive of nothing, "birds that were lost, unreal." So were the works of pagans and heathens. The relation of almsgiving to religion was thus entirely altered. The personal reward here or hereafter to the actor was eliminated. The deed was good only in the same sense in which the doer was good; it had in itself no merit. This was a great gain, quite apart from any question as to the sufficiency or insufficiency of the outward show of obedience to the outward scheme of salvation. The deed, it was realized, was only the outcome of the doer, the expression of himself, what he was as a whole, neither better nor worse. Logically this led to the discipline of the intelligence and the emotions, and undoubtedly "justification" to very many was only consistent both with such discipline and implied it. Thus under a new guise the old position of charity reasserted itself. But there were other differences.

The relation of charity to prayer, fasting, almsgiving and penance was altered. The prayerful contemplation of the Christ was preserved in the mysticism of Protestantism; but it was dissociated from the "historic Christ," from the fervent idealization of whom St Francis drew his inspiration and his active charitable endeavor. The tradition did not die out, however. It remained with many, notably with George Herbert, of whom it made, not unlike St Francis, a poet as well as a practical religious priest; but the absence of it indicated in much post-Reformation endeavor a want, if not of devotion, yet of intensity of feeling which may in part account for the fact that sectarianism in relief has since proved itself stronger than charity, instead of yielding to charity as its superior and its organizer. Fasting was parted from prayer and almsgiving. It was "a thing not of its own proper nature good as the love of father or mother or neighbour, but according to its end." Almsgiving also as a "work" disappeared and with it a whole series of inducements that the state should have for the sake of the charity and the nobility of the charitable act. It was no wonder that the preachers advocated it in vain, and reproached their hearers with their diminution of bounty to the poor; the old personal incentive had gone, and coupled with it a desire to induce individuals into acts of personal religion very slowly wedging itself into true views of social duty and purpose. Penance, once so closely related to almsgiving, passed out of sight. Charity, the love of God and our neighbour, had two offices, it was said, "to cherish good and harmful and to correct and punish vice without regard to persons." Correction as a means of discipline takes the place of penance, and it becomes judicial, regulating and controlling church membership by the authority of the church, a conception of the ideal of the public charitable institution. It became a thing of the municipality or state, in connexion with what now first appear, not prisons, but houses of correction.

The religious life was to be democratic—not in religious bodies, but in the whole people; and in a new sense—in relation to family and social life—it was to be moral. That was the significance of the Reformation for charity. It landed directly with a movement of religious activity towards a complete fulfillment of the duties of civic life, the older classical social theory, fostered by the Renaissance, assumed a new influence—the great conception of the state as a community bound together by charity and friendship.

"We be not born to ourselves," it was said, "but partly to the use of our country, of our parents, of our kinsfolk, and partly of our friends and neighbors; and therefore all good virtues are grafted on us naturally, whose effects be to do good to others, when it sheweth forth the image of God in man, whose property is ever to do good to others" (Lamond, p. 14). Economic theory also changed. Instead of the medieval opinion of the "theologian or social preacher," that "to trade could only be defended on the ground that honestly conducted it made no profit" (Green, li. 71), we have a recognition of the advantages resulting from exchange, and individual interests, it is argued, are not necessarily inconsistent with those of the state, but are, on the contrary, a source of solid good to the whole community.

Municipal laws for the suppression of the mendicity of the able-bodied and the organization of relief on behalf of the infirm were common in England and on the continent (Colmar, 1362; Nuremberg, 1478; Strassburg, 1523; London, 1514). Vives (Ehrle, Beiträge zur Gesch. des Mönch und der Familie, 1868) has gone, at the court of Henry VIII., in a book translated into several languages and widely read, seems to have summed up the thought of the time in regard to the management of the poor. He sets forth the view that: "All poorhouses, the public homeless beggars and the poor at home. He would have a census taken of the number of each class in the town, and information obtained as to the causes of their distress. Then he shall establish a system of relief—public, municipals, charitable. Work was to be supplied for all, while begging was strictly forbidden. Non-settled poor who were able-bodied were to be sent to their homes. Able-bodied settled poor who knew no craft were to be put on public work—the undeserving being set to hard labour. For other work was to be found, or they were to be assisted to become self-supporting. The hospitals provided with medical advice and necessary were to be classified to meet the needs of the sick, old, and lunatics. The poor living at home were to work with a view to their self-support. What they earned, if insufficient, might be supplemented. If a citizen found a case of distress he was not to help it, but to send it for inquiry to the magistrate. Children were to be taught a trade or taught to read and write. The funds of endowed charities were to be the chief source of income; if more was wanted, bequests and church collections would suffice. The scheme was put in force in Ypres in 1524. The Sorbonne approved the plan, and it, and similar plans in other public works—the undeserving being set to hard labour. It is in connexion with the scheme of London city charity promoted by Edward VI., by which the poor were classified. St Bartholomew's and St Thomas's hospitals appropriated for the sick, Christ's hospital for the children of the poor, and Bridewell for the correction of the able-bodied. More and more, and beyond the compulsory rate, the hospitals are those of the Poor Relief Act of Queen Elizabeth of 1601. At first the attempt had been made to introduce state relief in reliance on voluntary alms (Mary 13, ø. 1562–1563), subject to the right of assessment, others refused. But the position was anomalous. Charity is voluntary, and spontaneously meets the demands of distress. Such demands have always a tendency to increase with the supply. Hence the very
limitations of charitable finance are in the nature of a safeguard. At most economic trouble can only be assuaged by relief, and it can only be met or prevented by economic and social reforms. If a compulsory rate be not enforced, as in Scotland and formerly in some parishes in England, a voluntary rate may be made in supplement-ation of the local charities. In Scotland, where the compulsory clauses of the Poor Relief Act of James I., were not put in force, the country weathered the storm without them, and the compulsory rate was not introduced until the year 1844, came in very slowly in the 18th and 19th centuries. In France (1566) a similar act was passed and set aside. If a compulsory rate be enforced, it is inevitable that the resources of charity, under the weight of poor relief, administration costs, and poor rates, diminishes. On the other hand, much of the public distress is due, more than that of the poor 

of English Industry and Commerce: Modern Times, i. 168). It was not repealed till 1844.

From 1583 to 1624 there was, it is said, a slight increase in labourers' wages, which fluctuated from 2s. 4d. to 3s. 8d. a week, with a declining standard of comfort and at times great distress. Then there was a marked increase of wage till 1652 and "a very marked improvement; the rate of increase being very nearly double that of the earlier periods," and reaching 9s. "as the highest weekly rate for the whole period." Then from 1652 to 1702 there was "a slight improvement" (Hewins, p. 89). It would seem indeed that the stir of the times between 1622 and 1662 may have caused a great demand for labour. But with the Restoration, when the assessment system was falling into desuetude, came the Poor Relief Act of 1662 (13 & 14 Car. II. cap. 62), which brought in the law of settlement, and a settlement relief for a very strict nature was added to the industrial settlement of the Artificers and Labourers Act. Thus, if the influence of that act, which had so long controlled labour, was waning, its place was now taken by an act which, though it had nothing to do with the assessment of wage, yet so settled the labourer within the bounds of his parish that he had practically removed all control over the justices, yet upon a customary wage limited and restricted so as to prevent the settlement. And the assessment by the justices, in so far as it may have continued, would therefore be of little or no consequence. Settlement also, like the Artificers and Labourers Act, would prevent the country labourer from passing to the towns, or the townsman passing to other towns. At least they would do so at the risk of forfeiting their right to relief if they lost their settlement without acquiring a new one. Hence the industrial control, though under another name and other conditions, remained in force to a large extent in practice.

By the Artificers and Labourers Act then, in conjunction with other measures, the labouring classes were finally committed to a new bondage, when they had freed themselves from the serfdom of feudalism, and when the control exercised over them by the guild and municipality was relaxed. The statute was so enforced that to earn a year's livelihood would have taken a labourer not 52 weeks, but sometimes two years, or 58 weeks, or 80 weeks, or 72 weeks; sometimes, however, less—48 or 35. It followed that on such a system the country could only with the utmost good fortune free itself from the economic difficulties of the century, and that the need of a poor-law was felt the more as these difficulties persisted. A voluntary or a municipal system could not suffice, even as a palliative, while such statutes as these were in force to render labour immobile and unprogressive. Also, while wages were fixed by statute or order, whether chiefly in the interest of the employers or not, obviously any shortage on the wages had to be made good by the community. The community, by fixing the wages to be earned in a livelihood, made itself responsible for their sufficiency. And it is suggestive to find that in the year in which the Artificers and Labourers Act (1563) was passed, the act for the enforcement of assessments of poor-rate (5 Eliz. cap. 3) was also enacted. The Law of 'Settlement, to which we have referred, passed in the reign of Charles II., was due, it is said, to a migration of labourers southward from counties where less favourable statutory wages were fixed, and it was in fact, out a corollary of the Artificers and Labourers Act of 1563, and the Poor Relief Act of 1600. These laws, it may be said, were the means of making the English labourer, until the poor-law reform of 1834, a settled but landless serf, supported by a fixed wage and a state bounty. By the poor-law it was possible to continue this state of things till, in consequence of an absolute economic breakdown, there was no alternative but reform.

The philanthropic nature of the poor-law is indicated by its antecedents: once enacted, its bounty became a right; its philanthropy disappeared in a quasi-legal claim. Its object was to relieve the poor by home industries, apprentice children, and provide necessary relief to the poor unable to work. The act was commonly interpreted so as to include the whole of that indeterminate class, the "poor"; by a better and more rigid interpretation it
was, at least in the 19th century, held to apply only to the “desti-
tute,” that is, to those who required “necessary relief” — accord-
ing to the actual wording of the statute. The economic fallacy
of home industries founded on rate-supplied capital was clearly
declared itself, and the method could only have continued as long as it did
because it formed part of a general system of industrial control.
When in the 18th century workhouses were established, the same
industrial fallacy, as records show, repeated itself under new
conditions. Within the parish it resulted in the farmer paying
the labourer as small a wage as possible, and leaving the parish
in order to provide whatever he might require in addition during
his working life and in his old age. Thus, indeed, a gigantic ex-
periment in civic employment was made for at least two centuries on
a vast scale throughout the country—and failed. As was natural,
the lack of economic independence reacted on the morals of the
people. With pauperism came want of energy, idleness and
and a disregard for charity and the obligations of marriage. The law,
it is true, recognized the mutual obligations of parents and grand-
parents, children and grandchildren; but in the general poverty
which it was itself a means of perpetuating such obligations
became practically obsolete, while at all times they are difficul
to enforce. Still, the fact that they were recognized implies a
great advance. But the operation of the law from year to year, was very slowly put in
force. Even before it was passed the poor-rate first assessed under the act of 1563
was felt to be “a greater tax than some subsidies,” and in the time
of Charles II. it amounted to a third of the revenue of England
and Wales (Rogers, v. 81).

The service of villain and cottar was, as we have now seen, 
in part superseded by what we have called a statutory wage-control,
found on a basis of wage supplemented by relief, provided by a
rate-supported poor-law. But it follows that with the decay of
this system the poor-law itself should have disappeared, or should
have taken some new and very limited form. Unfortunately,
as in Roman times, state relief proved to be a popular and
vigorous parasite that outlived the tree on which it was rooted:
assessments of wage under the Statute of Labourers fell into
disuse after the Restoration, it is said, and the statute was
finally repealed in 1814, and sixty years later the act against
illegal combinations of working men; but the serfdom of the
poor-law, the decemseria cistica, remained, to work the gravest evil
that was responsible for, and even after the Reformation, it greatly impeded their
independent assertion. Nevertheless, by a new law of state alms for the aged, or by statutory
outdoor relief, as some would wish, a regulated wage, it is now
proposed to bring them once again under a thrall similar to
that from which they have so slowly emancipated themselves.

The policy adopted by Queen Elizabeth for the relief of the
poor (1561) included a scheme for the reorganization of voluntary
charity as well as plans for the extension of rate-aided
relief. During the century, as we have seen, endeavours
had been made to create a system of voluntary charity.

This it was proposed to safeguard and promote con-
currently with the extension of the poor-rate. Accordingly,
in the poor-law it was arranged that the overseers, the new civic
authority, and the churchwardens, the old parochial and chari-
table authority, should act in conjunction, and, subject to magis-
terial approval, together “raise weekly or otherwise” the
necessary means “by taxation of every inhabitant.” The old
charitable organization was based on endowment, and the church-
wardens were caretakers, and even as such formed the
foundations of many endowments. What was not available from these and other
sources was to be raised “by taxation.” The object of the new
act was to encourage charitable gifts.

Towards the end of the 18th century, when the administration
of poor relief fell into confusion, many charities were lost, or were
in danger of being lost, and many were mismanaged. In 1786
and 1788 a committee of the House of Commons reported on the
subject. In 1818, chiefly through the instrumentality of Lord
Brougham, a commission of inquiry on educational charities
was appointed, and in 1819 another commission to investigate (with
some exceptions) all the charities for the poor in England and
Wales. These and subsequent commissions continued their
inquiries till 1835, when a select committee of the House of
Commons was appointed, to the establishment of a permanent and independent board, to inquire, to compel
the production of accounts, to secure the safe custody of charity
property, to adapt it to new uses on cy-près lines, &c. A
commission followed in 1849, and eventually in 1853 the first
Charitable Trusts Act was passed, under which “The Charity
Commissioners of England and Wales” were appointed.

The following are details of importance—(1) Definition.—The defini-
tion of the act of 1601 (Charitable Uses, 43 Eliz. 4) still holds
good. It enumerates as charitable objects all that was once called
“alms”:(a) The relief of aged, impotent and poor people
(4); (b) he poor: “the relief of soldiers and mariners”—the poor chiefly by reason of war, some time a class of
privileged mendicants; (c) education, “schools of learning, free
schools and scholars in universities”; and (e) a group of
objects which include general civic and religious purposes, and the
charities of gilds and corporations: “the repair of bridges, ports,
havens, causeways, churches, sea-banks and highways; the
education and prefection of orphans; the relief, stock, or maintenance for
soldiers, and, in general, the advance of natural
morals.”—(2) Charitable Gifts.—A public trust and a charitable trust are, as this definition shows, synonymous. Public trust is a trust which relates to
charities, and is not held for the benefit of private persons, e.g. relations, but for
the common good, and, subject to the instructions of the founder,
by trustees responsible to the community. Gifts for charitable
purposes, therefore, have always been viewed with favour. Where a charitable bequest is
causal of two constructions, one of which would make it void
and the other would make it effectual, the latter will be adopted by the
courts. (Rogers, v. 74, p. 183.) The same was held by the
Court of Chancery in the case of D. v. D. (7) (Burdett, p. 167). Gifts to the poor, or widows, or orphans, in
definitely, or in a particular parish, were valid under the act
for any purpose or institution for the aid of the poor.” Thus
practically the only cases of rejection of the whole or of the parts of
wards it was decided that, “as a rule, persons receiving parochial
relief were not entitled to the benefit of a charity intended for the poor” (Tudor, p. 167).

(3) Religious Differences.—In the admin-
istration of charities which make for the poor the broadest view is
taken of religious differences. (4) Superstitions Uses.—The superstitions
use is one that has for its object the propagation of the rights of
a religion not tolerated by the law (Tudor, p. 4). Consequently,
so far as this is concerned, the use of a charity is
required, the purpose of the charity is illegal, or became legal only as toleration was extended.
Thus by degrees, since the Toleration Act of 1668, all charities to dis-
senters have become legal—that is, trusts for schools, places for reli-
gious instruction, education and charitable purposes generally. But
becoming for purposes for the soul, those objects, if the
ordain, are still void. (5) Administration.—The duty of admin-
ing charitable trusts falls upon trustees or corporations, and under the term “eleemosynary corporations” are included endowed hospitals
and endowed academic, ecclesiastical and charitable
charities have been remodelled, besides trustees elected by corpora-
tions, there are now usually appointed ex-officio trustees who repre-
sent some office or institution of importance in connexion with the
charity. (6) Jurisdiction.—The jurisdiction of the Court of Chancery has jurisdiction over charities, under the old
principle that “charities are trusts of a public nature, in regard to
which no one is entitled by an immediate and peculiar interest to
prosecute against the trustees or to enforce the carrying out of
their obligations.” The court, accordingly, represents the crown
as parents patriae. Now, by the Charitable Trusts Act 1853,
and subsequent acts, a charity commission has been formed which is
the representative of the crown in the judicial and administra-
tion of charities. (7) Jurisdiction by Visitor.—A further jurisdiction is by the “visitor,” a right inherent in the founder of any eleemos-
ynary corporation, and his heirs, or those whom he appoints, or in their absence, by a board of visitors. The object of the
visitor is “the advancement of the purposes of the
charity, or to compose differences among members of the
charity.” Formerly the bishop’s ordinary was the recognized
visitor (2 Henry V. 1, 1414) of hospitals, apart from the
founder. Subsequently the power was limited (14 Eliz. c. 5, 1572)
so far as concerns the use of the charitable income, with the
appointment of visitors. Then (1601) by the Charitable
Uses Act commissions were issued for inquiry by county juries. Now, apart from the duty of visitors,
inquiry is conducted by the charity commissioners and the assistant
commissioners; but multitudinous and eleemosynary charities have been still further separated and defined.
(8) Advice.—“Trustees, or other persons concerned in the management
of a charity, may apply to the charity commissioners for their opinion, advice or direction; and any person acting under such advice is indemnified, unless he has been guilty of misrepresentation in obtaining it." (9) Limitation of Charity Commissioners' Powers.—The commissioners have power to make a removal of trustees, or of any officer, and for the transfer, payment, and vesting of any real or personal estate, "or for the establishment of any scheme for the administration of the charity. (11) Schemes and Votes.—(1) The schemes of charity must be remodeled, and small and miscellaneous charities put into one fund and applied to new purposes. The cy-près doctrine is applied, by which if a testator leaves directions that are only indefinite, or if the object for which a charity was founded is obsolete, the charity is apportioned to the widest use; or, if it is apportioned to a charitable intention of the founder. This doctrine probably received its widest application in the City of London Parochial Charities Act of 1835. Under other acts doles have been applied to existing charitable purposes, and the remodelling of charities, the course of a year. (12) Objects adopted in remodelling Charities. In the remodelling of charities for the general benefit of the poor some one or more of thirteen objects are usually included in the scheme of the commissioners, to wit, education; religious charity; club or co-operative clothing societies, to a friendly society; for nurses, for annuities, for out-door service, &c.; for emigration; for recreation, grounds, clubs, reading-rooms, museums, lectures, for temporary removal; for the use of clothing houses, for medical aid, food, &c., or in money "in cases of unexpected loss or sudden destitution"; for pensions. (13) Parochial Charities.—By the Local Government Act of 1832, local ecclesiastical charities, i.e. endowments or bequests of lands, of money, of income for spiritual persons, church and other buildings, for spiritual uses, &c., are separated from parochial charities, "the benefits of which are, or the separate distribution of the benefits of which is, confined to individuals of a particular family, tribe, or place, or to persons of a particular parish, or not more than five neighbouring parishes." These charities, since the Local Government Act 1834, are under the supervision of the parish councils, who appoint trustees for their management, and who take action in the event of failure. The vestry also acts as an additional guardian under certain conditions, "additional trustees." The accounts have to be submitted to the parish meeting, and the names of the beneficiaries of dole charities published. (14) Official Trustees.—There is also "an official trustee of charity lands," who as "bare trustee" may hold the land or stock of the charity managed by the trustees or administrators. In 1905 the stock transferred to the official trustees amounted to £24,800,945. (15) Audit.—The charitable company or corporation must, on or before the 1st August in every year, prepare a statement of accounts, and transmit it to the commissioners. The accounts have to be "certified under the hand of one or more of the trustees and by the auditor of the charity," and the accounts must be kept in "some safe place, and belonging to hospitals or almshouses, or vested in trustees for charitable purposes, allowances are made in diminution of income-tax (56 Vict. 35 § 61). From the inhabited house duty any hospice charity school, or house provided for the reception or relief of poor persons out of hospital charity, or holding gift or bequest must pay no duty. In addition, there is an exemption from the land-tax in regard to land rents, &c., in possession of hospitals before 1603. (17) The Digest.—A digest of endowed charities in England and Wales was compiled in the years 1811-1848. A digest of reports and financial particulars has since been completed.

The income of endowed charities in 1876 was returned at £1,935,465. It is now, no doubt, considerably larger than it was in 1876. Partial evidence of the regular diminution in the income in England and Wales for the assistance of the aged poor and for doles. Between the poor-law, which, as it is at present administered, is a permanent endowment provided from the rates for the support of a class of persons included in that scheme, and endowed charities, there is a demonstrable difference in the income of successive generations, there is no great difference. But in their resources and administration the difference is marked. Local endowed charities were constantly founded after Queen Elizabeth: the year 1639 was the centenary of the foundation of the majority of the local charities. When corn and fuel were dear and clothes very expensive, what now seem trivial endowments for food, fuel, coal and clothes were important assets in the thriftiness management. Most of these endowed charities were supported from the tenements of dependants entitled by law to relief from the community, the rate increased out of all proportion to the charities. A distinction then made itself felt between the 'parish' poor and the 'second' poor, or the poor who were not relieved from the rates, and relief from the rates altogether overshadowed the charitable aid. Charitable endowments were ignored, ill-administered, and often were lost. After 1834 the poor-law was brought under the control of the central government. Poor relief was placed in the hands of boards of guardians in unions of parishes. The method of co-operation between poor-law and charity suggested by the acts of Queen Elizabeth was set aside, and, as a responsible partner in the public work of charitable administration, the endowed charities remained in general a disorganized medley of separate trusts, jealously guarded by incompetent administrators. To give unity to this mass of units, so long as the principles of charity are maintained, would be an important task, and one that is certainly an unpopular task. So far as it has been achieved, it has been accomplished by the piecemeal legislation of schemes cautiously elaborated to meet local prejudices. Active reform has been resisted, and the present system of administration by select committees, which is to be replaced by a charity board, which will be elected by a limited number of local charities, and chosen in such a way as to select those trustees who show a disposition to co-operate most effectually with the Poor Law Board, in a system of public notice to be published in the 'London Gazette' or the 'Fortnightly Review.' The number of charity commissioners will be reduced to one or two, and the appointment of a superintendent of charities is left to be regulated by the regulations of the Poor Law Board. The idea of a charity board, which includes members of the Poor Law Board, is taken from the example of the trustees of the Foundling Hospital. The charitable trusts may then be administered in connection with the Poor Law, and the system proposed is to make the combined control an advantage to the charities.
that it outstripped all financial expenditers. The lesson of the experiment is the same as that of the poor-law catastrophe before 1854; only, instead of the abjured poor of another age, infants were made the object of a compassionate but undiscerning philanthropy. With widespread relief there came widespread abandonment of duty and economic bankruptcy. Had the poor-rates instead of charitable relief been used in the same way, the moral injury would have been as great, but the annual draft from the rates would have concealed the moral and postponed the economic disaster. To amend the evil, changes were made by which the relation between child and mother was kept alive, and a personal application on her part was required; the character of the mother and her circumstances were investigated, and assistance was only given when it would be "the means of replacing the mother in the course of virtue and the way of an honest livelihood." General reforms were also made, especially through the instrumentality of Jonas Hanway, to check infant mortality, and metropolitan parishes were required to provide for their children outside London. A kindred movement led to the establishment of penitentiaries (1758), of lock hospitals and lying-in hospitals (1749-1753), etc. In London alone, there were new educational movements—"the charity school," to teach poor children the alphabet and the principles of religion," followed by the Sunday-school movement (1780), and about the same time (1788) by "the school of industry"—to employ children and teach them to be industrious. In 1844 the Ragged School Union was established, and until the Education Act of 1870 continued its voluntary educational work. As an outcome of these movements, through the efforts of Miss Mary Carpenter and many others, in 1854-1855 industrial and reformatory schools were established, to prevent crime and reform child criminals. The orphanage movement, beginning in 1758, when the Orphan Working Home was established, has been continued to the present day on a vastly extended scale. In 1772 a society for the discharge of persons imprisoned for small debts was established, and in 1773 Howard began his prison reforms. This raised the standard of work in institutional charities generally. After the civil wars the old hospital foundations of St Bartholomew's, endowed by the will of the physician Sir John Baste, were re-established; and in 1762 Sir Montagu Mulates, the public-spirited lord mayor, founded the Foundling Hospital, which, by its example, has led many others to adopt its plan of rearing children apart from their parents. In the 18th century the charitable movement was developed—a system of local dispensaries with fairly definite districts and home visiting, a substitute for attendance at a hospital, where "hospital fever" was dreaded, and an alternative to what then was a very ill-administered system of poor-law medical relief. After 1840 the provident dispensary was introduced, in order that the patients by small contributions in the time of health might provide themselves with means to meet large doctor bills, and the doctor might receive some sufficient remuneration for his attendance on poor patients. This movement was largely extended after 1860. Three hospital funds for collecting contributions for hospitals and making them grants, a movement that originated in Birmingham in 1859, were established in London in 1873 and 1897.

Since 1868 the poor-law medical system of Great Britain has been immensely improved and extended, while at the same time the number of medical charities receiving grants of the medical relief in most of the larger towns has greatly increased. The following figures refer to London: at hospitals, 97 in number, in-patients (1904) during the year, 118,536; out-patients and casualty cases, 1,858,800; patients at free, part-pay, or provided dispensaries, about 280,000; orders issued for attendance at poor-law dispensaries and at home, 114,758. The number of beds in poor-law infirmaries (1904) was 16,976. There were in London 12 general hospitals with, 18 without, medical schools, and 67 special hospitals. Thus the population in receipt of public and voluntary medical relief is very large, indeed altogether excessive.

Each religious movement has brought with it several charities. The Society of Friends, the Wesleyans, the Baptists have large charities. With the extension of the High Church movement there have been established many sisterhoods which support penitentiaries, convalescent homes and hospitals, schools, missions, etc.

The magnitude of this accumulating provision of charitable relief is evident, though it cannot be summed up in any single total. At the beginning of the 19th century anti-mendicacy societies were established; and later, about 1869, in England and Scotland a movement began for the organization of charitable relief, in connexion with which there are now societies and committees in most of the larger towns in Great Britain, in the colonies, and in the United States of America. More recently the movement for the establishment of settlements in poor districts, initiated by Canon Barnett at Toynbee Hall—"to educate citizens in the knowledge of one another, and to provide them with teaching and recreations"—has spread to many towns in England and America.

These notes of charitable movements suggest an altogether new development of thought. On behalf of the charity school of Queen Anne's time were preached very formal sermons, which showed but little sympathy with child life. After the first half of the century a new humanism with which we connect the name of Rousseau, slowly superseded this formal beneficence. Rousseau made the world open its eyes and see nature in the child, the family and the community. He analysed social life, intent on explaining it and discovering on what its well being depended; and he stimulated that desire to meet definite social needs which is apparent in the charities of the century. Little as it may appear to be so at first sight, it was a period of charitable reformation. Law revised the religious conception of charity, though he was himself so strangely devoid of social instinct that, like some of his successors, he linked the utmost earnestness in belief to that form of almsgiving which most effectually fostered beggary. Howard introduced the era of inspection, the apostolic apostle of a new social sagacity; and Bentham, no less sagacious, propounded opinions, plans and suggestions which, perhaps it may be said, in due course moulded the principles and methods of the poor-law of 1834. In the broader sense the turn of thought is religious, for while usually stress is laid on the religious scepticism of the century, the deeper, fervent, conscientious and evangelical charity in which Nonconformists, and especially "the Friends," took so large a part, is often forgotten. Sometimes, indeed, as often happens now, the feeling of charity passed into the merest sentimentality. This is evident, for instance, from so ill-considered a measure as Pitt's Bill for the relief of the poor. On the other hand, during the 18th century the poor-law was the object of constant criticism, though so long as the labour statutes and the old law of settlement were in force, and the relief of the labouring population as state "poor" prevailed, it was impossible to reform it. Indeed, the criticism itself was generally vitiated by a tactless acceptance of the poor as a class, a permanent and irrevocable characteristic of the system; and at the end of the 18th century, when the labour statutes were abrogated, but the conditions under which poor relief was administered remained the same, serfdom in its later stage, the serfdom of the poor-law, asserted itself in its extremest form in times of dearth and difficulty during the Napoleonic War. In 1802-1803 it was calculated (Marshall's Digest) that 28% of the population were in receipt of permanent or occasional relief. Those in receipt of the former numbered 734,817, including children—so real had this serfdom of the poor become.

In 1832 the expenditure on pauperism in England and Wales was £7,036,668. In the early years of the 19th century the mendicacy societies, established in some of the larger towns, were a sign of the general content with existing methods of administration. The Society for Bettering the Condition of the
CHARITY AND CHARITIES

Poor—representing a group of men such as Patrick Colquhoun, Sir I. Bernard, Dr Lettsom, Dr Haygarth, James Neald, Count Rumford and others—took a more positive line and issued many useful publications (1796). After 1833 the very atmosphere of thought seems changed. There was a general desire to be quit of the serfdom of pauperism. The Poor-law Amendment Act was passed in 1834, and since then male able-bodied pauperism has dwindled to a minimum. The bad years of 1860–1870 revived the problem in England and Scotland, and the old spirit of reform for a time prevailed. Improved administration working with economic progress effected still further reductions of pauperism, till on the 1st of January 1905 (exclusive of lunatics in county asylums and casual paupers) the mean number of paupers stood at 764,589, or 22·6 per thousand of the population, instead of 41·8 per thousand as in 1859 (see Poor-Law).

Charity organization societies were formed after 1869, with the object of improving the condition of the poor, or, in other words, to promote independence by an ordered and co-operative charity; and the Association for Befriending Young Servants, and workhouse aid committees, in order to prevent relapse into pauperism on the part of those who as children or young women received relief from the poor-law. The Local Government Board adopted a restricted out-door relief policy, and a new interest was felt in all the chief problems of local administration. The movement was general. The results of the Elberfeld system of municipal relief administered by unpaid almoners, each dealing with but one or two cases, influenced thought both in England and America. The experience gained by Mr Joseph Tuckerman of Boston of the utility of registering applications for relief, and the teaching of Miss Octavia Hill, led to the foundation of the system of friendly visiting and associated charity at Boston (1886) and elsewhere. Since that time the influence of Arnold Toynbee and the investigations of Charles Booth have led to a better appreciation of the conditions of labour; and to some extent, in London and elsewhere, the spirit of charity has assumed the form of a new devotion to the duties of citizenship. But perhaps, in regard to charity in Great Britain, the most important change has been the revival of the teaching of Dr Chalmers (1780–1847), who (1819) introduced a system of parochial charity at St John’s, Glasgow, on independent lines, consistent with the best traditions of the Scottish church. In the development of the theory of charitable relief on the economic side this has been a main factor. His view, which he tested by experience, may be summed up as follows: Society is a growing self-supporting organism. Property passes on from rich to rich, from brother to brother, from neighbour and neighbour, master and employee, endless links of sympathy and self-support. Poverty is not an absolute, but a relative term. Naturally the members of one class help one another; the poor help the poor. There is thus a large invisible fund available and constantly used by those who, by their proximity to one another, know best how to help. The philanthropist is an alien to this life around him. Moved by a sense of contrast between his own lot, as he understands it, and the lot of those about him, whom he but little understands, he concludes that he should relieve them. But his gift, unless it be given in such a way as to promote this self-support, instead of weakening it, is really injurious. In the first place, by his interference he puts a check on the charitable resources of another class and lessens their social energy. What he gives they do not want, though they might do so. But next, he does more harm than this. He stimulates expectation, so that by a false arithmetic his gift of a few shillings seems to those who receive it and to those who hear of it a possible source of help in any difficulty. To them it represents a large command of means; and where one has received what, though it be little, is yet, relative to wage, a large sum to be acquired without labour, many will seek more, and with that object will waste their time and be put off their work, or even be tempted to lie and cheat. So social energy is diverted from its proper use. Alms thus given weakens social ties, diminishes the natural relief funds of mutual help, and beggars a neighbour instead of benefiting him. By this argument a clear and well-defined purpose is placed before charity. Charity becomes a science based on social principles and observation. Not to give aims, but to keep alive the saving health of the family, becomes its problem: relief becomes altogether subordinate to this, and institutions or societies are serviceable or the reverse according as they serve or fail to serve this purpose. Not poverty, but distress is the plea for help; not almsgiving, but charity the means. To charity is given a definite social aim, and a desire to use consistently with this aim every method that increasing knowledge and trained ability can devise.

Under such influences as these, joined with better economic conditions, a great reform has been made. The poor-law, however, remains—the modern eleemosyna civica. It now, indeed, absorbs a proportionately less amount of the largely increased national income, but, excluding the maintenance of lunatics, it costs Great Britain more than twelve millions a year; and among the lower classes of the poor, directly or indirectly, it serves as a bounty on dependence and is a permanent obstacle to thrift and self-reliance. The number of those who are within the circle of its more immediate attraction is now perhaps, in different parts of the country or different districts in a town, not more than, say, 20% of the population. Upon that population the statistics of a city census would show a pauperism not of 2·63, the percentage of the mean day pauperism on the population in 1906, but of 13·15%; and the percentage would be much greater—twice as large, perhaps—if the total number of those who in some way received poor relief in the course of a year were taken into account. The English poor-law is thus among the lower classes, those most tempted to dependence—say some six or seven millions of the people—a very potent influence definitely antagonistic to the good development of family life, unless it be limited to very narrow proportions, as, for instance, to restricted individual or institutional relief for the sick, for the aged and infirm, who in extreme old age require special care and nursing, and for the afflicted, for whom no sufficient charitable provision is procurable. As ample experience shows, only on these conditions can poor-law relief be justified from the point of view of charity and the common good. In marked contrast to this opinion is the English movement for Old Age pensions, which came to its first fruition in 1906—a huge charity started on the credit of the state, the extension of which might ultimately involve a cost comparable with that of the army or the navy. Schemes of the kind have been adopted in the Australasian colonies with limitations and safeguards; and they seem likely to develop into a new type of poor-relief organization for the aged and infirm (Report: Royal Commission on Old Age Pensions, Minutes, 13th Report, 1906). In England, partly to meet the demand for better state provision for the aged, the Local Government Board in 1906 urged the boards of guardians to give more adequate outdoor relief to aged deserving people, and laid no stress on the test of destitution, or, in other words, the limitation of relief to what was actually "necessary," the neglect of which has led to new difficulties. History has proved that demoralization results from the wholesale relief whether of the mass of the citizens, or of the able-bodied, or of the children, and the proposal to limit the endowment to the aged makes no substantial difference. The social results must be similar; but social forces work slowly, and usually only the unanswerable argument of financial bankruptcy suffices to convert a people habituated to dependence, though the inward decay of vitality and character may long before be manifest. Ultimately the distribution of pensions by way of out-door relief, corrupting a far more independent people, is calculated to work a far greater injury than the annona civica. Such an endowment of old age might indeed be justified as part of a system of regulated labour, which, as in earlier times, could not be enforced without some such extraneous help, but it could not be justified otherwise. It is naturally associated, therefore, with socialist proposals for the regulation of wage.

In the light of the principles of charity, which we have considered historically, we have now to turn to two questions: charity and economics, and charity and socialism.

The object of charity is to render to our neighbour the services and duties of goodwill, friendship and love. To prevent distress
The economy of charity.

Charity has for its further object to preserve and develop the manhood and womanhood of individuals and their self-maintenance in and through the family; and, as a form of state intervention is approved or disapproved by the same standard. By self-maintenance is meant self-sufficiency throughout life in its ordinary contingencies—sickness, widowhood, old age, &c. Political economy would define as the science of exchange and exchange value. Here it has to be considered in relation to the purposes of charity. By way of illustration we take, accordingly, three points: distribution and use, supplementation of wage, and the standard of well-being or comfort in relation to wage.

(1) Distribution and Use.—Economy in the Greek sense begins at this point—the administration and the use of means and resources. Political economy generally ignores this part of the problem. Yet from the point of view of charity it is cardinal to the whole of the question. The distribution of wage may or may not be largely influenced by trade unions; but the variation of wage, as is generally the case, by the increase or decrease of a few pence is of less importance than its use. Comparing a careful and an unwise user, the former in use may be as much as a third on the total wage. More abstention from alcohol may make, in a normal family, a difference of 6s. in a wage of 25s. On the other hand, membership of a friendly society is at a time of sickness or accident, the compensating stock of capital is by that means placed at the disposal of each individual who has a share in it. Further, even a small amount saved may place the holder in a position to get a better market for his labor; he can have an advantage in the market, but by cooperation that advantage may be reduced. Other points are obvious and need not be mentioned. It is evident that while the amount of wage is important, still more important is its use. If use has a larger expense of distribution than distribution itself, the exchange between skill and wage must be free if it is to be valid. The less the skill the greater is the temptation to philanthropists to supplement the lesser wage; and the more important is non-supplementation, for the individual cannot look to the labor market for any of its own interests in the market, while the less skilled, because their labor is less marketable, have to make the greater effort to avoid dependence. But the role of endowed charities, outdoor relief, and any constant giving, tend to reduce wage, and to do two things at the expense of the means of independence. The employer is pressed by competition himself, and in return he presses for profit through a reduced wage, if circumstances make it possible for the workman to take it. And thus a few individuals may lower the wage of a large class of only skilled, or unskilled, labor. In these conditions unionism, even if it were likely to be advantageous, is not feasible. Unionism can only create a coherent unit of workers where there is a limited market and a definite saleable skill. Except for the time, unionism will have the indispensable effect of preventing the supplementation in any form—doles, clothes, or other kinds of relief; and in that case, too, the relief will probably produce lessened energy after a short time, or in other words lesserened ability to live. An insufficient wage may be a relief to the individual in the market, but, as a class, they then have the advantage of a better series of economic exchanges, but hardly otherwise. If the supplementation be not immediate, but postponed, as in the case of old-age pensions, its effect will be similar. To the extent of the prospective advantageous gain the attraction to the friendly society and to mutual help and saving will grow less. Necessity has been the inventor of these; and where wage is small, a little that would otherwise be saved is quickly spent if the necessity for saving it is removed. Only necessity, or else the will, to which it makes most difference ultimately, whether they are thrifty or whether or not they save for the future in any way. (3) The Standard of Well-being or Comfort in Relation to Wage.—With an increase of income, there generally results an increase in wants to be realized intelligently. Whatever is not so used reverts on the family to its undoing. Constantly when the wife can earn a few shillings a week, the husband will every week id for two or three days; so also if the husband finds that in a few days his wage has been diminished. This is a consideration to be his need may be removed. Thus, with a view to the prevention of distress in good times, where there is the less poverty there is the more need of charity, rightly understood; for charity would strive to promote the right use of wage, as the best means of preventing distress and preserving the economic family.

The theory of charity separates it entirely from socialism, as that word is commonly used. Strictly socialism means, in questions affecting the community, a dominant regard for the common or social good in so far as it is contrary to private or individual advantage. But even so the antithesis is misleading, for the two need not be inconsistent. On the contrary, the common good is really and ultimately only individual good (not advantage) harmonized to a common end. The issue, indeed, is that of old Greek days, and the conditions of a settlement of it are not substantially different. Using modern terms one may say that charity is an "interventionist." It has sought to transform the world by the transformation of the will and the inward life in the individual and in society. It would intensify the spirit and feeling of membership in society and would aim at improving social conditions, as science makes clear what the lines of reform should be. So it has constantly intervened in all kinds of ways, and, in the 19th century for instance, it has initiated many movements afterwards taken up by public authorities—such as prison reform, industrial schools, child protection, housing, food reform, &c., and it has been a friendly ally in many reforms that affect industry very closely, as, for instance, in the introduction of the factory acts. But it has never aimed at recasting society itself on a new economic plan, as does socialism. Socialism indeed offers the people a new state of social security. It recognizes that the annona civica and the old poor-law may have been bad, but it would meet the occasion made against them by insisting on the greater necessity for a state charity. In the one wage would be regulated and all would be supported, some by wage in adult life, some by allowance in old age, and others by maintenance in childhood. Accordingly for all schemes for the state maintenance of school children, old age pensions, or state provision for the unemployed are, like municipal trading, steps towards a final stage, in which none shall want because all shall be supported by society or be dependent on it industrially. To charity this position seems to exclude the ethical element in life and to treat the people primarily or chiefly as human animals. It seems also to exclude the motives for energy and endurance that come from self-maintenance. Against it, on the other hand, socialism would urge, that only by close regulation and penalty will the lowest classes be improved, and that only the society that maintains them can control them. Charity from its experience doubts the possibility of such control without a fatal loss of initiative on the part of those controlled, and it believes both that there is constant improvement on the present conditions of society and that there will be constantly more as science grows and its conclusions are put in force. Thus charity and socialism, in the usual meaning of the word, imply ultimately two quite different theories of social life. The first, practiced industrially, is already in existence, the other would develop it and allow it to develop.

The springs of charity lie in sympathy and religion, and, we shall now add, in science. To organize it is to give it the "ordered nature" of an organic whole, to give it a definite social purpose, and to associate the members of the community for the fulfilment of that purpose. The organization of charity.

This in turn depends on the recognition of common principles, the adoption of a common method, self-discipline and training, and co-operation. In a mass of people there may be a large variation in motives coincident with much unity in action. Thus there may be acceptance of a common social purpose in charity, while in one the impulse is similar to that which moved St Francis or George Herbert, in another to that which moved Howard or Dr Chalmers, or a modern poor-law reformer like Sir G. Nichols or E. Denison. Accepting, then, the principles of charity, we pass to the method in relation to assistance and relief. Details may vary, but on the following points there is general agreement among students and workers:—(1) A system of charity, which is to say two kinds of local relief: the public or poor-law relief, and relief connected with religious agencies. Besides, there is the relief of endowments, societies and charitable persons. Therefore, as a condition precedent to relief there must be some kind of investigation. One kind of investigation is for information and common help. A town should be divided for this purpose into manageable areas coincident with parishes or poor-law divisions, or other districts. Subject to an acceptance of general principles, those engaged in charity should be members of a local conference or committee, or allied to it. The conference would be the rallying-point of a large and somewhat loosely knit
association of friends and workers. (2) Inquiry and Registration. —The object of inquiry is to ascertain the actual causes of distress or dependency, and to carry on the work there must usually be a staff of several honorary and one or two paid workers. Two methods may be adopted: (1) a systematic inquiry in which the facts are covered, taking into consideration the character and habits of the persons concerned; and (2) a plan of inquiry in which the facts are covered by the facts of the case. If this is done in a methodical manner, it will lead to the ultimate self-support of the family and its members. If, however, the facts are not sufficiently covered, it may be necessary to take the facts partly or altogether, by degrees, and then to form and carry out some plan of relief, or to continue the family in need of help, in the hope of bringing them to conditions of self-support, leaving the family in the fullest degree of the opinions of the committee. A committee that is not sufficiently careful in considering the facts may be a relief-committee itself a direct source of relief. On the other method it has usually no relief fund, but it raises funds from relations, employers, charities, and charitable persons the relief required according to the plan of relief agreed upon. This method is better not to interfere with the facts than to give to the poor-law. The committee thus makes itself responsible for endeavours to the best of its ability to raise the necessary relief, and acts as trustee for those who do co-operate without it, in such a way as to keep intact and to give place to the natural obligations that lie within the inner circles of a self-supporting community. On the latter method the work of relief is left to general charity, or to private persons, or to the poor-law; and the special of self-supporting relief is the method of self-supporting relief, which is that adopted by the associated charities in Boston, Mass., and other similar societies in America and elsewhere. It is akin to that adopted in the municipal system of relief in Elberfeld and other German cities, where relief is given in cash. The method of associated help, combined with personal work, represents the usual practice of charity organization societies. Mutatis mutandis, the plan can be adapted to that of American self-supporting relief in which the family is not subject to the safeguards of sufficient training and settled method. The inquiry should cover the following points: names and address, and ages of family, previous addresses, past employment and wages, previous appearance, character, and errors, in order to help to identify the family, and savings, relations help (any help if any) from any source. These points should be verified, and reference should be made to the clergy, the poor-law authorities, and others, to ascertain if they know the family and the case. If the inquiry shows the family has been living, and what are the sources of possible help, and also what is his character. The problem, however, is not whether the person is "deserving" or "undeserving," but whether the facts are such as will require the support of the poor-law. The help can be given privately from within the circle of the family, so much the better. Often it may be best to advise, but not to interfere. In some cases but little help may be necessary; in others again the friendly relation between applicant and friend may last for months and years. Usually in charitable work the question of the kind of relief available—money, tickets, clothes, &c.,—governs the decision as to what should be done and what it should provide. Cases are overwhelming in number, as at the out-patient and casualty departments of a hospital, where the attendance is without restriction and there is no limit to the amount of relief, but when there is inquiry, and each case is seriously considered and aided with a view to self-support, the numbers will seldom be overwhelming. On this plan appeal is made to the private charity, as it has been an appeal to the self-interest, and the self-interest is realized; the self-interest of the poor-law, on the other hand, attracts the applicant, by an appeal to his weakness, and it requires of him no effort. Hence, apart even from the differing effect of inquiry, one method makes applicants, and the other limits their number, and in the latter plan much more strenuous endeavours be made to assist the lesser number of claimants. For the routine work of the office an extremely simple system of records with card index, &c., has been devised. There is a central registration of cases, notified by individual charities, poor-relief authorities and private persons. The system of charity organization or associated charity, it will be seen, allows of the personal to which the case is reduced. He requires the help of the family in the case and the remedial advice, and the utmost scope for personal work. (3) Training—If charitable work is an art, those who undertake it must needs be trained both in practice and method and in judgment. It requires, too, that the person train himself or herself in intelligence with care, and that he or she work to mastery of the purpose. In times of distress a reserve of trained workers is of the utmost service. At all times they do more and produce, socially, better results; but when there is general distress of any kind the greater their numbers, at least some of the mischief that comes of the panic which takes possession of a community, when distress is apprehended, and leads to the wildest distribution of relief. Also trained workers make the most fruitful poor-law workers, and the members of the secretaries of charitable societies and district visitors. All clergy and ministers and all medical men who have to be engaged in the administration of medical relief should learn the art of charity.

Poor-law guardians are usually elected on political or general grounds, and have no special knowledge of good methods of charity; and trustees are seldom appointed on the score of their qualifications on this head. To provide the necessary education in charity there must be an independent and disinterested committee of experts—those guardians with no political connection with the hospital, and who, at all events, are not to be discharged until their work is done. It would be better not to interfere with the facts than to give to the poor-law. The committee thus makes itself responsible for endeavours to the best of its ability to raise the necessary relief, and acts as trustee for those who do co-operate without it, in such a way as to keep intact and to give place to the natural obligations that lie within the inner circles of a self-supporting community. On the latter method the work of relief is left to general charity, or to private persons, or to the poor-law; and the special of self-supporting relief is the method of self-supporting relief, which is that adopted by the associated charities in Boston, Mass., and other similar societies in America and elsewhere. It is akin to that adopted in the municipal system of relief in Elberfeld and other German cities, where relief is given in cash. The method of associated help, combined with personal work, represents the usual practice of charity organization societies. Mutatis mutandis, the plan can be adapted to that of American self-supporting relief in which the family is not subject to the safeguards of sufficient training and settled method. The inquiry should cover the following points: names and address, and ages of family, previous addresses, past employment and wages, previous appearance, character, and errors, in order to help to identify the family, and savings, relations help (any help if any) from any source. These points should be verified, and reference should be made to the clergy, the poor-law authorities, and others, to ascertain if they know the family and the case. If the inquiry shows the family has been living, and what are the sources of possible help, and also what is his character. The problem, however, is not whether the person is "deserving" or "undeserving," but whether the facts are such as will require the support of the poor-law. The help can be given privately from within the circle of the family, so much the better. Often it may be best to advise, but not to interfere. In some cases but little help may be necessary; in others again the friendly relation between applicant and friend may last for months and years. Usually in charitable work the question of the kind of relief available—money, tickets, clothes, &c.,—governs the decision as to what should be done and what it should provide. Cases are overwhelming in number, as at the out-patient and casualty departments of a hospital, where the attendance is without restriction and there is no limit to the amount of relief, but when there is inquiry, and each case is seriously considered and aided with a view to self-support, the numbers will seldom be overwhelming. On this plan appeal is made to the private charity, as it has been an appeal to the self-interest, and the self-interest is realized; the self-interest of the poor-law, on the other hand, attracts the applicant, by an appeal to his weakness, and it requires of him no effort. Hence, apart even from the differing effect of inquiry, one method makes applicants, and the other limits their number, and in the latter plan much more strenuous endeavours be made to assist the lesser number of claimants. For the routine work of the office an extremely simple system of records with card index, &c., has been devised. There is a central registration of cases, notified by individual charities, poor-relief authorities and private persons. The system of charity organization or associated charity, it will be seen, allows of the personal to which the case is reduced. He requires the help of the family in the case and the remedial advice, and the utmost scope for personal work. (3) Training—If charitable work is an art, those who undertake it must needs be trained both in practice and method and in judgment. It requires, too, that the person train himself or herself in intelligence with care, and that he or she work to mastery of the purpose. In times of distress a reserve of trained workers is of the utmost service. At all times they do more and produce, socially, better results; but when there is general distress of any kind the greater their numbers, at least some of the mischief that comes of the panic which takes possession of a community, when distress is apprehended, and leads to the wildest distribution of relief. Also trained workers make the most fruitful poor-law workers, and the members of the secretaries of charitable societies and district visitors. All clergy and ministers and all medical men who have to be engaged in the administration of medical relief should learn the art of charity.
practitioners are still further injured. The doctors, as a medical staff, are not only medical men, but whether they recognize the fact or not, they are also administrators or almoners; what they give is relief. Yet few or none of them have ever been trained for that work, and consequently they do not realize how very advantageous, even for the cure of their own patients, would be a thorough treatment of each case both at the hospital and outside it. Nor can they understand how their methods at present protract sickness and promote habitual dependence. Where this side of their work studied by them in any way they would be the first, probably, to press upon the governors of their hospitals the necessity for a change. Unfortunately, at present the governors are themselves untrained, and to finance the hospital and to make it a good institution is their sole object. Hospitals, however, are, after all, only a part of the general administration of charity; much as they are now managed they have seldom any systematic connexion with that administration. Nor is there any co-ordination between the several hospitals and dispensaries. If one rightly refuses further treatment to certain applicants, they have only to wander to some other hospital, there to be admitted with little or no scrutiny. For usually outpatients and casualty patients are not even registered, nor can they be identified if they apply again. Practically they come and go at will. The definite limit of cases, according to some standard of effectual work, association with general charity, trained almonership and inquiry, and a just regard for the interests of general practitioners, are stepping-stones to reform. In towns where medical charities are numerous a representative board would promote mutual help and organization.

Like the poor-law, endowed charities may be permanent institutions established to meet what should be passing and decreasing needs (cf. the arguments in The State and Charity, by T. Mackay). Administered as they usually are in isolation—apart from the living voluntary charities of the generation, and consisting often of small trusts difficult to utilize satisfactorily, they tend to create a permanent demand which they meet by fixed quantities of relief. Also, as a rule, they make no systematic inquiries with a view to the verification of the statements of the applicants, for they have no staff for these purposes; nor have they the assistance of almoners or friendly visitors. Nor does the relief which they give form part of any plan of help in conjunction with other aid from without; nor is the administration subject to frequent inspection, as in the case of the poor-law. All these conditions have led to a want of progress in the actual administration of endowed charities, in regard to which it is often very difficult to prevent the exercise of an undue patronage. But there is no reason why these charities should not become a responsible part of the country's administration, aiding it to reduce outdoor pauperism.

It was never intended that the poor-law should extinguish the endowed charities, still less, as statistics now prove, that where endowments abound the rate of pauperism should be considerably above the average of the rest of the country. This shows that these charities often foster pauperism instead of preventing it. As a step towards altering this ratio a partial return to the verification of endowed charities in England and Wales is greatly needed. The consolidating schemes of the charity commissioners have done much good; still more may be done in some counties by extending to the county the benefits of the charities of well-endowed towns, as has been accomplished by the extension of the eleemosynary endowments of the city of London to the metropolitan police area. Nor, again, until quite lately, and that as yet only in a few schemes, has the principle been adopted that pensions or other relief should be given only in supplementation of the relief of relations, former employers and friends, and not in substitution of it. This, coupled with good methods of inquiry and supervision, has proved very beneficial. Hitherto, however, to a large extent, endowed charities, it must be admitted, have tended to weaken the family and to pauperize.

In many places funds are raised for the relief of school children by the supply of meals during the winter and spring; and an act has now been passed in England (1906) enabling the cost to be put upon the rates. Usually a very large number of children are said to be underfed, but inquiry shows that such statements may be taken as altogether excessive. They are sometimes based on information drawn from the children at school; or sometimes on general deductions; they are seldom founded on any systematic and competent inquiry at the homes. When this has been made, the numbers dwindle to very small proportions. Teachers of experience have noted the effect of the meals in weakening the independence of the family. While they are forthcoming women sometimes give up cooking meals at home, use their money for other things, and tell the child he can get his meal at school. Great temptations are put before a parent to neglect her family, and very much distress is due to this. The meals—just at a time when, owing to the age of her children, the mother's care is most needed, and just in those families where the temptation is greatest, and where the family instinct should be strengthened—stimulate this neglect. Considered from the point of view of meeting by eleemosynary provision a normal economic demand for food, intervention can only have one result. The demand must tend to outstrip the supply, so long as there are resources available on the one side, and until on the other side the desire of the social class that is chiefly exposed to the temptations of dependence in relation to such relief has been satisfied. If the provision be made from the resources of local or general taxation the largeness of the fund available will allow practically of an unlimited expansion of the supply of food. If the provision be made from voluntary sources, in some measure limited therefore and less certain, this very fact will tend to circumscribe demand and limit the offer of relief. It is indeed the problem of poor-law relief in 1832 over again. The relief provided by local taxation practically unlimited will create a mass of constant claimants, with a kind of assumed right to aid based on the payment of rates; while voluntary relief, whatever its shortcomings, will be less injurious because it is less amply endowed.

In Paris the municipal subvention for meals rose from 543,000 francs in 1892 to 1,000,000 in 1904. Between 1894 and 1904 there was an increase of 0.9% in the school population; and an increase of 28% in the municipal grant. In that period the contributions from the local school funds (caisses d'écoles) decreased 36%; while the voluntary contributions otherwise received were insignificant; and the payments for meals increased 2%.

The subject has been lately considered from a somewhat different standpoint (cf. the reports of the Scottish Royal Commission on Physical Education, 1903; of the Inter-departmental committees on Physical Deterioration, 1905, and on Medical Inspection and the Feeding of School Children, 1905; also the report of the special committee of the Charity Organization Society on "the assistance of school children," 1893). After careful investigations medical officers especially have drawn attention to the low physical condition of children in schools in the poorer parts of large English towns, their low stature, their physical defects, the improper food supplied to them at home, their uncleanliness, and their want of decent bringing-up, together with the physical defects of the young people entering the professions and higher education. The reports of the medical officers have shown that, as women more usually become breadwinners, they receive less attention, and the home and its duties are neglected, while in the lowest sections of the poorer classes social irresponsibility reaches its maximum. Cheap but often quite improper food is provided, and infant mortality, which is largely preventable, remains as high as ever, though adult life is longer. This with a marked decrease in the birth-rate in recent years, has. It may be said, opened out a new field for charitable effort and social work. Science is at each revision of the problem making its task more definite. Actually the mere demand for meals stands for less; the reform of home conditions for more. So it was hoped that instead of making school meals a charge on taxation, as parliament has done, it would be content to leave it a voluntary charge, while the medical inspection of elementary schools will be made universal; representative relief committees formed for schools or groups of schools; the cases of want or distress among the school children dealt with individually in
connection with their families, and, where necessary, day schools established on the lines of day industrial schools.

At a time of exceptional distress the following suggestions founded on much English experience may be of service (cf. Report of special committee of the Charity Organization Society on the best means of dealing with exceptional distress, 1886). Usually at such a time proposals are made to establish special funds, and to provide employment to men and women out of work. But it is best, if possible and as long as possible, to rely on existing agencies, and to strengthen them. Round them there are usually workers more or less trained. A new fund usually draws to it new people, many of whom may not have had any special experience at all. If a new fund is inevitable, it is best that it should make its grants to existing agencies after consultation with them. In any case, a clear policy should be adopted, and people should keep their heads. The exaggeration of feeling at a time of apprehended or actual distress is sometimes extraordinary, and the unwise action which it prompts is often a cause of continuing pauperism afterwards. Where there is public or poor-law relief the following plan may be adopted—in any large town there are usually three or four poor-law charitable committees or other areas. The local people already at work in these matters should be brought into local committees. In each case a quick inquiry should be made, and the relieving officer communicated with, some central facts verified, and the home visited. Roughly, cases may be divided into three classes: the irresponsible casual labouring class, a middle class of men with decent homes, who have made no provision for the future, and are not members of either friendly society or trades union; and a third class, who have made some provision. These usually are affected last of all; at all hazards they should be kept from receiving public relief, and should be helped, as far as possible, privately and personally. If there are public works, the second class might be referred to them; if there are not, probably some should be left to the poor-law, some assisted in the same way as members of class three. Much would turn upon the family and the home. The first class should be left to the poor-law. If there is no poor-law system at work they should be put on public works. Working men of independent position, not the creatures of any political club, but such as are responsible members of a friendly society, or are otherwise well qualified for the task, should be employed under the direction of each case, but if the pressure is great, at first at least it may be necessary to make grants according to some generally sufficient scale. There should be as constant a revision of cases as time permits. Great care should be taken to stop the relief as soon as possible, and to do nothing to make it the stepping-stone to permanent dependence.

If employment be provided it should be within the skill of all; it should be fairly remunerated, so that at least the scantiness of the pay may not be an excuse for neglect; and it should be paid for according to measured or piece work. The discipline should be strict, though due regard should be paid at first to those unaccustomed to digging or piece work. In England and Wales the guardians have power to open labour yards. These, like charities which provide work, tend to attract and keep in employment a low class of labourer or workman, who finds it pays him to use the institution as a convenience. It is best, therefore, to avoid the opening of a labour yard if possible. If it is opened, the discipline should be very strict, and when there is less or no compensation, relief in the workhouse should at once be offered. The difficulty of furnishing work for men employed in a labour yard, of which in England at least half has been to given in kind, should, it has been said, be dealt out from day to day. This leads to the men giving up the work sooner than they otherwise would. They have less to spend.

In Great Britain a great change has taken place in regard to the provision of employment in connexion with the state.

Since about 1890 there has been a feeling that men in distress from want of employment should not be dealt with by the poor-law. A circular letter issued by the Local Government Board in 1886, and subsequently in 1895, coincided with this feeling. It was addressed to town councils and other local authorities, asking them to provide work (1) which will not involve the stigma of pauperism, (2) which all can perform whatever may have been their previous avocations, and (3) which does not compete with that of other labourers at present in employment. This circular led to the vestries and subsequently the borough councils in many districts becoming partially recognized relief authorities for the unemployed, concurrently with the poor-law. Much confusion resulted. The local authorities had seldom any suitable organization for the investigation of applications. It was difficult to supply work on the terms required; and the work was often ill-done and costly. Also it was found that the same set of people would apply year after year, unskilled labourers usually out of work part of the winter, or men habitually "unemployed." As on other occasions when public work was provided, very few of the applicants were found to be artisans, or members of trades unions or of friendly societies. In 1904 Mr Long, then president of the Local Government Board, proposed that local voluntary distress committees should be established in London consisting of poor-law guardians and town councillors and others, more or less supervised by a central committee and ultimately by the Local Government Board. This organization was set on foot and a large sum was subscribed for its work. The report on the result of the work was somewhat doubtful (Report, London Unemployed Fund, 1904-1905), but in 1905 the Unemployed Workmen's Act was passed, and in London and elsewhere distress committees like the voluntary committees of the previous year were established by statute. It was enacted that for establishment expenses, emigration and removal, labour exchanges, and the acquisition of land a halfpenny rate might be levied, but that the rate would not be available for the re-employment of men employed. For this purpose (1905-1909) a large charitable fund was raised. A training farm at Hollesley Bay was acquired, and it was hoped to train Londoners there to become fit for agricultural work. It is impossible to judge this experiment properly, on the evidence available up to 1908. But one or two points are important: (1) something very like the "right to labour" has been granted by the legislature; (2) this has been done apart from the conditions required by the poor-laws and orders of the Local Government Board on poor relief and without imposing disfranchisement on the men concerned; (3) a labour rate has not been levied, but a rate has been levied in aid of the provision of employment; (4) if the line of development that the act suggests should be followed (as the renewed Labour agitation in 1908-1909 made probably it must), then it may tend to create a class of "unemployed," unskilled labourers of varying grades of industry who may become the dependent and state-supported proletariat of modern urban life. Thus, unless the administration be extremely rigorous, once more will a kind of serfdom be established, to be, as some would say, taken over hereafter by the socialist state.

In some of the English colonies Homeric hospitality still prevails, but by degrees the station-house or some refuge is established in the towns as they grow more populous. Vagrancy. Finally, some system of labour in exchange for relief is evolved. At first this is voluntary, afterwards it is officially recognized, and finally it may become part of the system of public relief. As bad years come, these changes are made step by step. In England the vagrant or wayfarer is tolerated and discouraged, but not kept employed. He should be under greater pressure to maintain himself, it is thought. The provision made for him in different parts of the country is far from uniform, and now, usually, at least in the larger towns, after he has had a bath and food, he is admitted to a separate room or cell in a casual ward. Before he leaves he has to do a task of work, and, subject to the discretion of the master, he is detained two nights. This plan has reduced vagrancy, and if it were universally adopted clean accommodation would everywhere be provided for the vagrant without the attractions of a common or "associated" ward; and probably vagrancy would diminish still further. It seems almost needless to say that, in these circumstances at any
CHARITY AND CHARITIES

rate, casual alms should not be given to vagrants. They know much better how to provide for themselves than the almsgiver imagines, for vagrancy is in the main a mode of life not the result of any casual difficulty. Vagrancy and criminality are also nearly allied. The magistrate, therefore, rather than the almsgiver, should usually interfere; and, as a rule, where the magistrates are strict, vagrancy in a county diminishes. An inter-departmental committee (1906) taking generally this line, reported in favour of vagrants being placed entirely under police control, and it recommended a system of wayfarers' tickets for men on the roads who are not habitual vagrants, and the committal of men likely to become habitual vagrants to certified labour colonies for not less than six months. Still undoubtedly vagrancy has its economic side. In a bad year the number of tramps is increased by the addition of unskilled and irresponsible labourers, who are soonest discharged when work is slack. As a part voluntary system under official recognition the German Arbeiterkolonien are of interest. This in a measure has led to the introduction of labour homes in England, the justification of which should be that they recruit the energy of the men who find their way to them, and enable them to earn a living which they could not do otherwise, a fact recently demonstrated to society by the Royal Commission achieved. Charitable refuges or philanthropic common lodging houses, usually established in districts where this class already congregate, only aggravate the difficulty. They give additional attractions to a vagrant and casual life, and make it more endurable. They also make a comfortable avoidance of the responsibilities of family life comparatively easy, and in so far as they do this they are clearly injurious to the community.

The English colonists of the New England states and Pennsylvania introduced the disciplinary religious and relief system of Protestantism and the Elizabethan poor-law. To the former reference has already been made. With an appreciation of the fact that the cause of distress is not usually poverty, but weakness of character and want of judgment, and that relief is in itself no remedy, those who have inherited the old Puritan traditions have, in the light of toleration and a larger social experience, organized the method of friendly visiting, the object of which is illustrated by the motto, "Not alms, but a friend." To the friendship of charity is thus given a disciplinary force, capable of immense expansion and usefulness, if the friendship on the side of those who would help is sincere and guided by practical knowledge and sagacity, and if on the side of those in distress there is awakened a reciprocal regard and a willingness to change their way of life by degrees. Visiting by "districts" is set aside, for "friendliness" is not a quality easily diffused over a wide area. To be real it must be limited as time and ability allow. Consequently, a friendly visitor usually befriends but one or two, or in any case only a few, families. The friendly visitor is the outcome of the movement for "associated charities," but in America charity organization societies have also adopted the term, and to a certain extent the method. Between the two movements there is the closest affinity. The registration of applicants for relief is much more complete in American cities than in England, where the plan meets with comparatively little support. At the office of the associated charities in Boston there is a central and practically a complete register of all the applications made to the public authority for poor relief, to the associated charities, and to many other voluntary bodies.

The Elizabethan poor-law system, with the machinery of overseers, poor-houses and out-door relief, is still maintained in New England, New York state and Pennsylvania, but with many modifications, especially in New York. A chief factor in these changes has been immigration. While the county or town remained the administrative area for local poor relief, the large number of immigrant and "unsettled" poor, and the business connected with their removal from the state, entailed the establishment of a secondary or state system of administration and aid, with special classes of institutions to which the counties or towns could send their poor, as, for instance, state reform schools, farms, almshouses, &c. For the oversight of these institutions, and often of prisons also and lunatic asylums, in many states there have been established state boards of "charity or corrections and charity." The members of these boards are selected by the state for a term of years, and give their services honorably. There are state boards in Massachusetts, New York, Pennsylvania, Ohio, Illinois, Minnesota, Michigan, Wisconsin, Iowa, Colorado, North Carolina and elsewhere. There is also a district board of charities in the district of Columbia. These boards publish most useful and detailed reports. Besides the state board there is sometimes also, as in New York, a State Charities Aid Association, whose members, in the counties in which they reside, have a legal right of entry to visit and inspect any public or charitable institution owned by the state, and any county and other poor-house. A large association of visitors accustomed to inspect and report on institutions has thus been created.

Further, the counties and towns in New York state, for instance, and Massachusetts, and the almshouse districts in Pennsylvania, are under boards of supervision. Usually the overseers give outdoor relief, and the pauperism of some areas is as high as that in some English unions, 3, 4 and 5%. On the whole population of the United States, however, and of individual states, consisting usually of comparatively young and energetic immigrants, the pauperism is less. Pennsylvania, for instance, had by 1890 a population of 5 million, of which 625,000 were classed as paupers; the almshouse admissions were 16,000 and the entries 7,800. It has been the general policy of the state to order the removal to the state almshouse of unsettled residents of the several cities and towns in need of temporary aid, thus avoiding some of the abuses incident to out-door relief." In New York state, in the city of New York, including Brooklyn, the distribution of outdoor relief by the department of charities is forbidden, except for purposes of transportation and for the adult blind. Most counties in the state have an almshouse, and the county superintendents and overseers of the poor "furnish necessary relief to such of the county poor as may require only temporary assistance, or are so disabled that they cannot be safely removed to the almshouse." Public attention is in many cases being drawn to the inutility and injury of out-door relief.

In some states and cities the system of subsidizing voluntary institutions is in full force, and it is in force also in many English colonies. At first sight it has the advantage of providing relief for public purposes without the creation of a new staff or establishment. There is then an apparent economy. But the evils are many. Political partisanship and favour may influence the amount and disposition of the grants. The grants act as a bounty on the establishment and continuance of charitable institutions, homes for children, hospitals, &c., but not on the expansion of the voluntary charitable funds and efforts that should maintain them; and thus charitable homes exist in which charity in its truer sense may have little part, but in which the chief motive of the administration may be to support sectarian interests by public subsidies. Claimants for relief have little scruple in turning such institutions to their own account; and the institutions, being financially irresponsible, are not in these circumstances scrupulous on their side to prevent a misdirection of their bounties. "Parents unload their children upon the community more recklessly when they know that such children will be provided for in private orphan asylums and protectories, where the religious training that the parents prefer will be given them." (Amos G. Warner, in International Congress: Charities and Correction, 1890.) In New York city illustrates the same evil. The admission was entirely in the hands of the managers. They admitted; the city paid. In New York city the population between 1870 and 1890 increased about 80%; the subsidies for prisoners and public paupers increased by 43%; but those for paupers in private institutions increased from $334,828 to $1,845,872, or about 461%. The total was at that time $3,794,072; in 1898 it was rather less, $3,132,786. The alternative to this system is either the establishment of state or municipal institutions, and possibly in special cases payments to voluntary homes for the maintenance of inmates admitted at the request of a state authority, as at certified and other homes in England, with grants made conditional on the work being conducted on specified lines, and subject to a certain increasing
amount of voluntary financial support; or a close general and
financial inspection of charitable institutions—the method of
reform adopted in New York; or payment for only those inmates
who are sent by public authorities and admitted on their request.

The enormous extent to which children's aid societies have been
increased in the United States, sometimes with the help of the
considerable public grants, suggests the greatest need for caution
from the point of the preservation of the family as the central
element of social strength in the community. The problem of
charity in relation to medical relief in the large towns of the
United States is similar to that of England; its difficulties are
alike.

LITERATURE.—As good translations of the classics become ac-
cessible it is easy for the general reader or student to combine a
study of the principles of charity in relation to the community with
a study of history. Thus, and in connexion with special investi-
gations and the conditions of practical charity, social economics
may best be studied. In N. Masterman, Chalmer's on Charity (1900);
T. Mackay, Methods of Social Reform (1896); B. Bosanquet and
others, Some Aspects of the Social Problem (1894); and C. S. Loch,
Methods of Social Advance (1904), this point of view is generally
assumed. Special investigations of importance may be found in the
reports of medical officers of health. See Report of Committee
on Physical Deterioration referred to above, and, for instance, the New
York State Sanitary and Labor Commission in 1894. For
the history of charity there is no good single work.

On details there are many good articles in Darmen's Dictionary of
Classical Antiquities, and similar works. Modern Methods of
Charity, in the series Charles (1901, vol. vii), is a,
general information in regard to poor relief and charity in different
countries. Apart from books and official documents mentioned in
the text as indicating the present state of charitable and public
relief, the following aids to practical work, the following may be of service.
England:—Annual Charities' Register and Digest, with Introduction on "How to help Cases of Distress"; the Charity Organisation Review; Occasional Papers (3 vols.), published by the London Charity Organisation Society, 1888-89; Reports of Proceedings of Conferences of Poor-Law Guardians; The Strength of the People, by Helen Bosanquet; Homes of the London Poor and Our Common Land, by Miss Octavia Hill; The Queen's Poor, by M. Louise. United States:—The Proceedings of the International Conferences
Charities and Correction (1894), and the proceedings of the annual conferences; Friendly Visiting among the Poor, by Mary E. Rich-
mon (1893); American Charities, by Amos G. Warner (1898); The Practice of Charity, by E. T. Underwood; Reports of Proceedings of
State Legislatures, by Dr. J. Condon, &c., vol. ii; Das Armeewesen
in den Vereinigten Staaten von America, by Dr Francis G. Peabody
(1897); the Charities Review, published monthly by the New York
Charity Organisation Society; by the Consumers' Union, reports of
the Consumers' Union, and works by authorities on the subject of charity. France:—La Bibliographie charitable, by Camille Granier (1891); La Charité avant et depuis 1789, by P.
Hubert Valleroux; Fascicules of the Conseil superior de l'assistance publique, and the Société des amis de l'humanité, for the study of the questions of assistance. Germany:—Reports and Proceed-
ing of the Deutsche Verein für Armenpflege und Wohltätigkeit; Die Armenpflege, a practical handbook by Dr E. Münsterberg (1892).
Austria:—Österreichs Wohlfahrtsrecht, 1848-1898, by Dr. Ernest Mischler (1899). (C. S. L.)

CHARIVARI, a French term of uncertain origin, but probably
onomatopeic, for a mock serenade "rough music," made by
beating on kettles, fire-irons, tea-trays or what not. The
charivari was anciently in France a regular wedding custom, all
bridal couples being thus serenaded. Later it was reserved for
ill-assorted and unpopular marriages, for widows or widowers
who married secondly, or for those who only married for
money; and they were unpopular. At the beginning of the 17th century, wedding
charivaris were forbidden by the Council of Tours under pain of
excommunication, but the custom still lingers in rural districts.
The French of Louisiana and Canada introduced the charivari
into America, where it became known under the corrupted name of
"shivarv.

CHARKHARI, a native state in the Bundelkhand agency of
Central India. Area, 745 sq. m.; pop. (1901) 123,504; estimated
revenue £3,000. It is surrounded on all sides by other states of
Central India, except near Charakhir, where it meets the
United Provinces. It was founded by Bijai Bahadur (vikrama-
ditya), a son being granted him in 1804 and another in 1811.
The chief, whose title is maharaja, is a Rajput of the Bundel
clan, descended from Chhattar Si, the champion of the inde-
pendence of Bundelkhand in the 18th century. In 1857 Raja
Ratan Singh received a hereditary salute of 11 guns, a khilat and a perpetual jagir of £400 a year in recognition of his services
during the Mutiny. The town of Charkhari (locally Maharaj-
agani) is 40 m. W. of Banda; pop. (1901) 11,718.

CHARLATAN (Ital. ciarlalano, from ciarlare, to chatter), originally one who "patters" to a crowd to sell his wares, like a
"cheap-jack" or "quack" doctor—"quack" being similarly
derived from the noise made by a duck; so an impostor who
pretends to have some special skill or knowledge.

CHARLEMAGNE [Charles the Great] (c. 742-814), Roman
emperor, and king of the Franks, was the elder son of Pippin the
Short, king of the Franks, and Bertha, or Bertrada, daughter of
Charibert, count of Laon. The place of his birth is unknown
and its date uncertain, although some authorities give it as the 2nd
of April 742; doubts have been cast upon his legitimacy, and it is
just possible that the marriage of Pippin and Bertha took place
subsequent to the birth of their elder son. When Pippin was
crowned king of the Franks at St Denis on the 26th of July 754
by Pope Stephen II, Charles, and his brother Carloman, were
enointed by the pope as a sign of their kingly rank. The rough
survivals of the Frankish court were unfavorable to the
acquisition of learning, and Charles grew up almost ignorant of
letters, but hardly in body and skilled in the use of weapons.

In 761 he accompanied his father on a campaign in Aquitaine,
and in 763 undertook the government of several counties. In
768 Pippin divided his dominions between his two sons, and on
his death soon afterwards Charles became the ruler of the northern
portion of the Frankish kingdom, and was crowned at Noyon on
the 9th of October 768. Bad feeling had existed for some time
between Charles and Carloman, and when Charles early in 769
was called upon to suppress a rising in Aquitaine, his brother
refused to afford him any assistance. This rebellion, however,
was easily crushed, its leader, the Aquitanian duke Hunold, was
made prisoner, and his territory more closely attached to the
Frankish kingdom. About this time Bertha, having effected a
temporary reconciliation between her sons, overcame the
revenge with which Pope Stephen III. regarded an alliance
between Frank and Lombard, and brought about a marriage
between her daughter, who afterwards became queen of the
Lombards. Charles had previously contracted a union, probably
of an irregular nature, with a Frankish lady named Himiltrude,
who had borne him a son Pippin, the "Hunchback." The peace
with the Lombards, in which the Bavarians as allies of Desiderius
joined, was, however, soon broken. Charles thereupon repudi-
ated his Lombard wife (Bertha or Desiderata) and married in
771 a princess of the Alaman named Hildegarde. Carloman
died in December 771, and Charles was at once recognized at
Corbeny as sole king of the Franks. Carloman's widow Gerberga
had fled to the protection of the Lombard king, who espoused her
cause and requested the new pope, Adrian I., to recognize her two
sons as the lawful Frankish kings. Adrian, between whom and
the Lombards other causes of quarrel existed, refused to assent
to this demand, and when Desiderius invaded the papal terri-
tories he appealed to the Frankish king for help. Charles,
who was at the moment engaged in his first Saxon campaign,
expostulated with Desiderius; but when the latter proved useless he led his forces across the Alps in 773. Gerberga and
her children were delivered up and disappear from history;
the siege of Pavia was undertaken; and at Easter 774 the king
left the seat of war and visited Rome, where he was received
with great respect.

During his stay in the city Charles renewed the donation which
his father Pippin had made to the papacy in 754 or 756. This
transaction has given rise to much discussion as to its trust-
worthiness and the extent of its operation. Our only authority,
a passage in the Liber Pontificalis, describes the gift as including
the whole of Italy and Corsica, except the lands north of the Po,
Calabria and the city of Naples. The vast extent of this donation,
which, moreover, included territories not owning Charles's
authority, and the fact that the king did not execute, or
apparently attempt to execute, its provisions, has caused many
scholars to look upon the passage as a forgery; but the better
opinion would appear to be that it is genuine, or at least has a genuine basis. Various explanations have been suggested. The area of the grant may have been enlarged by later interpolations; or it may have dealt with property rather than with sovereignty, and have only referred to estates claimed by the pope in the territories named; or it is possible that Charles may have actually intended to establish an extensive papal kingdom in Italy, but was released from his promise by Adrian when the pope saw no chance of its fulfilment. Another supposition is that the author of the Liber Pontificalis gives the papal interpretation of a grant that had been expressed by Pippin in ambiguous terms; and this view is supported by the history of the subsequent controversy between king and pope.

Returning to the scene of hostilities, Charles witnessed the capitulation of Pavia in June 774, and the capture of Desiderius, who was sent into a monastery. He now took the title of "king of the Lombards," to which he added the dignity of "Patrician of the Romans," which had been granted to his father. Adalgis, the son of Desiderius, who was residing at Constantinople, hoped the emperor Leo IV. would assist him in recovering his father's kingdom; but a coalition formed for this purpose was inefficient, and, after a battle by his ally Rothgard, duke of Friuli, was easily crushed by Charles in 776. In 777 the king was visited at Paderborn by three Saracen chiefs who implored his aid against Abd-ar-Rahman, the caliph of Cordova, and promised some Spanish cities in return for help. Seizing this opportunity to extend his influence Charles marched into Spain in 778 and took Pamplena, but meeting with some checks decided to return. As the Frankish forces were defiling through the passes of the Pyrenees they were attacked by the Wascons (probably Basques), and the rear-guard of the army was almost annihilated. It was useless to attempt to avenge this disaster, which occurred on the 13th of August 778, for the enemy disappeared as quickly as he came; the incident has passed from the domain of history into that of legend and romance, being associated by tradition with the pass of Roncesvales. Among the slain was one Hruodland, or Roland, margrave of the Breton march, whose death gave rise to the Chanson de Roland (see Roland, Legend 07).

Charles now sought to increase his authority in Italy, where Frankish counts were set over various districts, and where Hildegarde, duke of Spoleto, appears to have recognized his overlordship. In 780 he was again in the peninsula, and at Mantua issued an important capitulary which increased the authority of the Lombard bishops, relieved freemen who under stress of famine had sold themselves into servitude, and condemned abuses of the system of vassalage. At the same time commerce was encouraged by the abolition of unauthorized tolls and by an improvement of the coigne; while the sale of arms to hostile peoples, and the trade in Christian slaves were forbidden. Proceeding to Rome, the king appears to have come to some arrangement with Adrian about the donation of 774. At Easter 811, Carlotan, his second son by Hildegarde, was renamed Pippin and crowned king of Italy by Pope Adrian, and his youngest son Louis was crowned king of Aquitaine; but no mention was made at the time of his eldest son Charles, who was doubtless intended to be king of the Franks. In 783 the king, having lost his wife Hildegarde, married Fastrada, the daughter of a Frankish count named Bostard, in the same year his mother Bertha died. The emperor Constantine VI. was at this time exhibiting some interest in Italian affairs, and Adalgis the Lombard was still residing at his court; so Charles sought to avert danger from this quarter by consenting in 781 to a marriage between Constantine and his own daughter Rothrude. In 786 the entreaties of the pope and the hostile attitude of Arichis II., duke of Benevento, a son-in-law of Desiderius, called the king again into Italy. Arichis submitted without a struggle, though the basis of Frankish authority in his duchy was far from secure; but in conjunction with Adalgis he sought aid from Constantinople. His plans were ended by his death in 787, and although the empress Irene, the real ruler of the eastern empire, broke off the projected marriage between her son and Rothrude, she appears to have given very little assistance to Adalgis, whose attack on Italy was easily repulsed. During this visit Charles had presented certain towns to Adrian, but an estrangement soon arose between king and pope over the claim of Charles to confirm the election to the archbishopric of Ravenna, and it was accentuated by Adrian's objection to the establishment by Charles of Grimoald III. as duke of Benevento, in succession to his father Archibis.

These journeys and campaigns, however, were but interludes in the long and stubborn struggle between Charles and the Saxons, which began in 772 and ended in 804 with the incorporation of Saxony in the Carolingian empire (see SAXONY). This contest, in which the king himself took a very active part, brought the Franks into collision with the Wiltz, a tribe dwelling east of the Elbe, who in 789 was reduced to dependence. A similar sequence of events took place in southern Germany. Tassilo III., duke of the Bavarians, who had on several occasions adopted a line of conduct inconsistent with his allegiance to Charles, was deposed in 788 and his duchy placed under the rule of Gerold, a brother-in-law of Charles, to be governed on the Frankish system (see BAVARIA). Having thus taken upon himself the control of Bavaria, Charles felt himself responsible for protecting its eastern frontier, which had long been open, to a people inhabiting the region now known as Hungary. He accordingly ravaged their country in 791 at the head of an army containing Saxion, Frisian, Bavarian and Alamannian warriors, which penetrated as far as the Raab; and he spent the following year in Bavaria preparing for a second campaign against them, the conduct of which, however, he was compelled by further trouble in Saxony to entrust to his son king Pippin, and to Eric, margrave of Friuli. These deputies succeeded in 792 and 796 in taking possession of the vast treasures of the Avars, which were distributed by the king with lavish generosity to churches, courtiers and friends. A conspiracy against Charles, which his friend and biographer Einhard alleges was provoked by the cruelties of Queen Fastrada, was suppressed without difficulty in 792, and its leader, the king's illegitimate son Pippin, was confined in a monastery till his death in 811. Fastrada died in August 794, when Charles took for his fourth wife an Alamannian lady named Litgarda.

The continuous interest taken by the king in ecclesiastical affairs was shown at the synod of Frankfurt, over which he presided in 794. It was on his initiative that this synod condemned the heresy of adoptionism and the worship of images, which had been restored in 787 by the second council of Nicaea; and at the same time that council was declared to have been superfluous. This policy caused a further breach with Pope Adrian; but when Adrian died in December 795, his successor, Leo III., in notifying his elevation to the king, sent him the keys of St Peter's grave and the banner of the city, and asked Charles to send an envoy to receive his oath of fidelity. There is no doubt that Leo recognized Charles as sovereign of Rome. He was the first pope to date his acts according to the years of the Frankish monarchy, and a mosaic of the time in the Lateran palace represents St Peter bestowing the banns upon Charles as a token of temporal supremacy, while the coinage issued by the pope bears witness to the same idea. Leo soon had occasion to invoke the aid of his protector. In 797 when Charles had been attacked and maltreated in the streets of Rome during a procession, he escaped to the king at Paderborn, and Charles sent him back to Italy escorted by some of his most trusted servants. Taking the same journey himself shortly afterwards, the king reached Rome in 800 for the purpose (as he declared) of restoring discipline in the church. His authority was undisputed; and after Leo had cleared himself by an oath of certain charges made against him, Charles restored the pope and banished his leading opponents.

The great event of this visit took place on the succeeding Christmas Day, when Charles on rising from prayer in St Peter's was crowned by Leo and proclaimed emperor and augustus amid the acclamations of the crowd. This act can hardly have been unpremeditated, and some doubt has been cast upon the statement which Einhard attributes to Charles, that he would not
have entered the building had he known of the intention of Leo. He accepted the dignity at any rate without demur, and there seems little doubt that the question of assuming, or obtaining, this title had previously been discussed. His policy had been steadily leading up to this position, which was rather the emblem of the power he already held than an extension of the area of his authority. It is probable therefore that Charles either considered the coronation premature, as he was hoping to obtain the assent of the eastern empire to this step, or that, from fear of evils which he foresaw from the claim of the pope to crown the emperor, he wished to crown himself. All the evidence tends to show that it was the time or manner of the act rather than the act itself which aroused his temporary displeasure. Contemporary accounts lay stress upon the fact that as there was then no emperor, Constantinople being under the rule of Irene, it seemed good to Leo and his counsellors and the "rest of the Christian people" to choose Charles, already ruler of Rome, to fill the vacant office. However, doubtfully such conjectures concerning his intentions may be, it is certain that immediately after his coronation Charles sought to establish friendly relations with Constantinople, and even suggested a marriage between himself and Irene, as he had again become a widower in 800. The death of Irene and the deposition of her successor followed this plan; and after a desultory warfare in Italy between the two empires, negotiations were recommenced which in 810 led to an arrangement between Charles and the eastern emperor, Nicephorus I. The death of Nicephorus and the accession of Michael I. did not interfere with the relations, and in 812 an embassy from Constantinople arrived at Aix-la-Chapelle, when Charles was acknowledged as emperor, and in return agreed to cede Venice and Dalmatia to Michael.

Increasing years and accumulating responsibilities now caused the emperor to alter somewhat his manner of life. No longer leading his armies in person he enlisted the direction of campaigns in various parts of his empire to his sons and other lieutenants, and from his favourite residence at Aix watched their progress with a keen and sustained interest. In 802 he ordered that a new oath of fidelity to him as emperor should be taken by all his subjects over twelve years of age. In 804 he was visited by Pope Leo, who returned to Rome laden with gifts. Before his coronation as emperor, Charles had entered into communications with El-Hakem, the Caliph of Bagdad, who had been himself deposed by his predecessor, and through these negotiations he bestowed gifts and honours upon the emperor, and made him an offer of alliance. In 805 he made a treaty of amity with the Saracens, and in 807 placed an embassy in the hands of the Saracen prince, who was to protect the Christians in Spain, and in 808 he received an ambassador and presents from Harun. In the same year the patriarch of Jerusalem sent him the keys of the Holy Sepulchre; and in 807 Harun not only sent further gifts, but appears to have confirmed the emperor's rights in Jerusalem, which, however, probably amounted to no more than an undefined protectorate over the Christians in that part of the world. While thus extending his influence even into Asia, there was scarcely any part of Europe where the power of Charles did not make itself felt. He had not visited Spain since the disaster of Roncevalles, but he continued to take a lively interest in the affairs of that country. In 798 he had concluded an alliance with Alphonso II., king of the Asturias, and a series of campaigns mainly under the leadership of King Louis resulted in the establishment of the "Spanish march," a district between the Pyrenees and the Ebro stretching from Pamplona to Barcelona, as a defence against the Saracens. In 790 the Balearic Islands had been handed over to Charles, and a long warfare was carried on by land and sea between Frankland and Saracen until the last was driven between the emperor and El-Hakem, the emir of Cordova. Italy was equally the scene of continuous fighting. Grimoald of Benevento rebelled against his lord; the possession of Venice and Dalmatia was disputed by the two empires; and Istria was brought into subjection.

With England the emperor had already entered into relations, and at one time a marriage was proposed between his son Charles and a daughter of Offa, king of the Mercians. English exiles were welcomed at his court; he was mainly instrumental in restoring Eardulf to the throne of Northumbria in 809; and Einhard includes the Scots within the sphere of his influence. In eastern Europe the Avars had owned themselves completely under his power in 805; campaigns against the Czechs in 805 and 806 had met with some success, and at about the same time the land of the Sorbs was ravaged; while at the western extremity of the continent the Breton nobles had done homage to Charles at Tours in 800. Thus the emperor's dominions now stretched from the Eider to the Ebro, and from the Atlantic to the Elbe, the Saale and the Raab, and they also included the greater part of Italy; while even beyond these bounds he exercised an acknowledged but shadowy authority. In 806 Charles arranged a division of his territories among his three legitimate sons, but this arrangement came to nothing owing to the death of Pippin in 810, and of the younger Charles in the following year. Charles then named his remaining son Louis as his successor; and at his father's command Louis took the crown from the altar and placed it upon his own head. This ceremony took place at Aix on the 11th of September 813. In 808 the Frankish authority over the Obotrites was interfered with by Gudrod (Godfrey), king of the Danes, who ravaged the Frisian coasts and spoke boastfully of leading his troops to Aix. To ward off these attacks Charles took a warm interest in the building of a fleet, which he reviewed in 811; but by this time Gudrod had been killed, and his successor Hemming made peace with the emperor.

In 812 Charles made his will, which shows that he contemplated the possibility of abdication. The bulk of his possessions were left to the twenty-one metropolitan churches of his dominions, and the remainder to his children, his servants and the poor. In his last years he passed most of his days at Aix, though he had sufficient energy to take the field for a short time during the Danish War. Early in 814 he was attacked by a fever which he sought to subdue by fasting; but pleurisy supervened, and after partaking of the communion, he died on the 28th of January 814, and on the same day his body was buried in the church of St Mary at Aix. In the year 1000 his tomb was opened by the emperor Otto III., but the account that Otto found the body upright upon a throne with a golden crown on the head and holding a golden sceptre in the hands, is generally regarded as legendary. The tomb was again opened by the emperor Frederick I. in 1165, when the remains were removed from a marble sarcophagus and placed in a wooden coffin. Fifty years later they were discovered by the emperor Frederick II. to a splendid shrine, in which the relics are still exhibited once a year.

The sarcophagus in which the body originally lay may still be seen at Aix, and other relics of the great emperor are in the imperial treasury at Vienna. In 1163 Charles was canonized by the antipope Paschal III. at the instance of the emperor Frederick I, and Louis XI. of France gave strict orders that the feast of the saint should be observed.

The personal appearance of Charles is thus described by Einhard:—"Big and robust in frame, he was tall, but not excessively so, measuring about seven of his own feet in height. His eyes were large and lustrous, his nose rather long and his countenance bright and cheerful." He had a commanding presence, a clear but somewhat feeble voice, and in later life became rather corpulent. His health was uniformly good, owing perhaps to his moderation in eating and drinking, and to his love for hunting and swimming. He was an affectionate father, and loved to pass his time in the company of his children, to whose education he paid the closest attention. His sons were trained in war and the chase, and his daughters instructed in the playing of instruments and in the exercises of sexual morality were primitive. Many concubines are spoken of, he had several illegitimate children, and the morals of his daughters were very loose. He was a regular observer of religious rites, took great pains to secure decorum in the services of the church, and was generous in almsgiving both within his empire and without. He reformed the Frankish liturgy, and brought singers from Rome to improve the services of the church. He had considerable knowledge of theology, took a prominent part in the theological controversies of the time, and was responsible for the addition of the clause filioque to the Nicene Creed. The most
CHARLEMAGNE

attractive feature of his character, however, was his love of learning. In addition to his native tongue he could read Latin and understood Greek, but he was unable to write, and Einhard gives an account of his futile efforts to learn this art in later life. He loved the reading of histories and astronomy, and by questioning travellers gained some knowledge of distant parts of the earth. He attended lectures on grammar, and his favourite work was St Augustine's De civitate Dei. He caused Frankish sagas to be collected, began a grammar of his native tongue, and spent some of his last hours in correcting a text of the Vulgate. He delighted in the society of scholars—Alcuin, Angilbert, Paul the Lombard, Peter of Pisa and others, and in this company the trappings of rank were laid aside and the emperor was known simply as David. Under his patronage Alcuin organized the school of the palace, where the royal children were taught in the company of others, and founded a school at Tours which became the model for many other establishments. Charles was unwearying in his efforts to improve the education of clergy and laity, and in 789 ordered that schools should be established in every diocese. The atmosphere of these schools was strictly ecclesiastical and the questions discussed by the scholars were often puerile, but the greatness of the educational work of Charles will not be doubted when one considers the rude condition of Frankish society half a century before. The main object of the Carolingian renaissance was to restore Latin to its position as a literary language, and to reintroduce a correct system of spelling and an improved handwriting. The manuscripts of the time are accurate and artistic, copies of valuable books were made and by careful collation the texts were purified.

Charles was not a great warrior. His victories were won rather by the power of organization, which he possessed in a marked degree, and he was eager to seize ideas and prompt in their execution. He erected a stone bridge with wooden piers across the Rhine at Mainz, and began a canal between the Altmühl and the Rednitz to connect the Rhine and the Danube, but this work was not finished. He built palaces at Aix (his favourite residence), Nijmegen and Ingelheim, and erected the church of St Mary at Aix, modelled on that of St Vitalis at Ravenna and adorned with columns and mosaics brought from the same city. He loved the simple dress and manners of the Franks, and on two occasions only did he assume the more stately attire of a Roman noble. The administrative system of Charles in church and state was largely personal, and he brought to the work an untiring industry, and a marvellous grasp of detail. He administered the pope, appointed the bishops, watched over the morals and work of the clergy, and took an active part in the deliberations of church synods; he founded bishoprics and monasteries, was lavish in his gifts to ecclesiastical foundations, and chose bishops and abbots for administrative work. As the real founder of the ecclesiastical state, he must be held much responsible for the evils which resulted from the policy of the church in exalting the ecclesiastical over the secular authority.

In secular affairs Charles abolished the office of duke, placed counts over districts smaller than the former duchies, and supervised their government by means of missi dominici, officials responsible to himself alone. Marches were formed on all the borders of the empire, and the exigencies of military service led to the growth of a system of land-tenure which contained the germ of feudalism. The assemblies of the people gradually changed their character under his rule. No longer did the nation come together to direct and govern, but the emperor summoned his people to assent to his acts. Taking a lively interest in commerce and agriculture, Charles issued various regulations for the organization of the land and the improvement of the other. He introduced a new system of weights and measures, which he ordered should be used throughout his kingdom, and took steps to reform the coinage. He was a voluminous lawgiver. Without abolishing the customary law of the German tribes, which is said to have been committed to writing by his orders, he added to it by means of capitularies, and thus introduced certain Christian principles and customs, and some degree of uniformity.

The extent and glamour of his empire exercised a potent spell on western Europe. The aim of the greatest of his successors was to restore it to its pristine position and influence, while many of the French rulers made its re-establishment the goal of their policy. Otto the Great to a considerable extent succeeded; Louis XIV. referred frequently to the empire of Charlemagne; and Napoleon regarded him as his prototype and predecessor. The empire of Charles, however, was not lasting. In spite of his own wonderful genius the seeds of weakness were sown in his lifetime. The church was too powerful, an incipient feudalism was present, and there was no real bond of union between the different races that acknowledged his authority. All the vigour of the emperor could not restrain the dishonesty and the cupidity of his servants, and no sooner was the strong hand of their ruler removed than they began to acquire territorial power for themselves.

AUTHORITIES.—The chief authorities for the life and times of Charlemagne are Einhard's Vita Karoli Magni, the Annales Lorschenses majores, the Annales Fuldenses, and other annals, which are published in the Monumenta Germaniae historica. Scriptores, Band 1, edited by Pertz and W. Dehio (Hanover and Berlin, 1860-1882). For the capitularies see Capitularia Regum Francorum edited by A. Boretius in the Monumenta, Leges. Many of the songs of the period appear in the Poetae Latini aevi Carolini, edited by E. Dümmler (Berlin, 1863-1868). The thirteenth-century annals are in the De rebus gestis Caroli Magni of the Chronicarum rerum Germaniarum, tome iv., edited by Ph. Jaffe (Berlin, 1871-1873), contains some of the emperor's correspondence, and Hinemar's De ordine palatii, edited by M. Prou (Paris, 1874), is also valuable.

The best modern authorities are S. Abel and B. Simon, Jahrbücher des fränkischen Reiches, (Cöln, 1885-1888); G. Richter und H. Kohl, Annalen des fränkischen Reichs im Zeitalter der Karolinger (Halle, 1885-1887); E. Mühlbacher, Denkmäler der Geschichtsquellen der Karolingerzeit (Stuttgart, 1886); H. Brosius, Karl der Grosse (Leipzig and Prague, 1886); J. I. Mombert, Geschichte des Grossreichs (London, 1888); M. Lipp, Das fränkische Großreich, (Breslau, 1892); J. von Döllner, Die Kaiserlisten der Karls des Großen und seiner Nachfolger (Munich, 1864); F. v. Wyss, Karl der Große und der strenge Staat (Berlin, 1869); Th. Sickel, Lehre von den Urkunden der ersten Karolinger (Vienna, 1867); E. Dümmler in the Allgemeine deutsche Biographie, Band 10, Th. Eichenauer, Die Erbfürsten der Kaiserzeit (Aix-la-Chapelle, 1864); J. A. Ketterer, Karl der Grosse und die Kirche (Munich and Leipzig, 1898); and J. B. Mullinger, Die Kaiser und die Kirche in der Ersten Kaiserzeit (Leipzig, 1897). The work of the monk of St Gall is found in the Monumenta, Band ii.; an edition of the Historia vita Karoli Magni et Roldani, edited by F. Castets, has been published (Paris, 1880), and an edition of the Vita Karoli by A. E. Pertz (Hanover, 1885), and also see P. Clemen, Die Fürsturkronik Karls des Grossen, (Leipzig, 1896). (A. W. H.)

THE CHARLEMAGNE LEGENDS

Innumerable legends soon gathered round the memory of the great emperor. He was represented as a warrior performing human feats, as a ruler dispensing perfect justice, and even as a martyr suffering for the faith. It was confidently believed towards the close of the tenth century that he had made a pilgrimage to Jerusalem; and, like many other Christian rulers, it was reported that he was only sleeping to awake in the lifetime of his country's need. We know from Einhard (Vita Karoli, cap. xxii.) that the Frankish heroic ballads were drawn up in writing by Charlemagne's order, and it may be accepted as certain that he was himself the subject of many such during his lifetime. The legendary element crept even into the Latin panegyrics produced by the court poets. Before the end of the 9th century a monk of St Gall drew up a chronicle De gestis Karoli Magni, which was based partly on oral tradition, received from an old soldier named Adalbert, who had served in Charlemagne's army. This recital contains various fabulous incidents. The author relates a conversation between Otkar the Frank (Ogier the Dane) and the Lombard king Desiderius (Didier) on the walls of Pavia in view of Charlemagne's advancing army. To Didier's repeated question "Is this the emperor?" Otkar continues to answer "Not yet," adding at last "When thou shalt see the fields bristling with an iron harvest, and the Po and the Ticino swollen with sea-flows, inundating the walls of the city
with iron billows, then shall Karl be nigh at hand." This episode, which bears the marks of popular heroic poetry, may well be the substance of a lost Carolingian cantilene.1

The legendary Charlemagne and his warriors were endowed with the great deeds of the early kings and heroes of the Frankish kingdom, for the romancers were not troubled by considerations of chronology. National traditions extending over centuries were grouped round Charlemagne, his father Pippin, and his son Louis. The history of Charles Martel especially was absorbed in the Charlemagne legend. But if Charles's name was associated with the heroism of his predecessors he was credited with equal readiness with the weaknesses of his successors. In the earlier chansons de geste he is invariably a majestic figure and represents within limitations the.grandeur of the historic Charles. But in the histories of the wars with his vassals he is often little more than a tyrannical dotard, who is made to submit to gross insult. This picture of affairs is drawn from later times, and the sympathies of the poet are generally with the rebels against the monarchy. Historical tradition was already dim when the hypothetical and much discussed cantilene, which may be taken to have formed the repository of the national legends from the 8th to the 10th century, were succeeded in the 11th and the early 12th centuries by the chansons de geste. The early poems of the cycle sometimes contain curious information on the Frankish court, and many of the judicial tales which had no parallels in contemporary institutions. The account in the Chanson de Roland of the trial of Ganelon after the battle of Roncesvalles has been adopted almost intact from earlier poets, and provides a striking example of the value of the chansons de geste to the historian of manners and customs. In general, however, the trouvère depicted the feeling and manners of his own time.

Charlemagne's wars in Italy, Spain and Saxony formed part of the common epic material, and there are references to his wars against the Slavs; but especially he remained in the popular mind as the great champion of Christianity against the creed of Mahomet, and even his Norman and Saxain enemies became Saracens in current legend. He is the Christian emperor directly inspired by angels; his sword Joyeuse contained the point of the lance used in the Passion; his standard was Romaine, the banner of St. Peter, which, as the oriflamme of Saint Denis, was later to be borne in battle before the kings of France; and in 1164 Charles was canonized at the desire of the emperor Frederick I. Barbarossa by the anti-pope Pascal III. This gave him no real claim to sainthood, but his festival was observed in some places until comparatively recent times, for the emperor was endowed with both the lavish and beauteous qualities of the epic king, and as in the case of Agamemnon and Arthur, his exploits paled beside those of his chief warriors. These were not originally known as the twelve peers2 famous in later Carolingian romance. The twelve peers were in the first instance the companions in arms of Roland in the Teutonic sense.3 The idea of the paladins forming an association corresponding to the Arthurian Round Table first appears in the romance of Fierabras. The lists of them are very various, but all include the names of Roland and Oliver. The chief heroes who fought Charlemagne's battles were Roland; Ganelon, afterwards the traitor; Turpin, the fighting archbishop of Reims; Duke Naimes of Bavaria, the wise counsellor who is always on the side of justice; Ogier the Dane, the hero of a whole series of romances; and Guillaume of Toulouse, the defender of Narbonne. Gradually most of the chansons de geste were attached to the name of Charlemagne, whose poetical history falls into three cycles—the geste du roi, relating his wars and the personal history of himself and his family; the southern cycle, of which Guillaume de Toulouse is the central figure; and the feudal epic, dealing with the revolts of the barons against the emperor, the rebels being invariably connected by the trouvères with the family of Doon de Mayence (q.v.).

The earliest poems of the cycle are naturally the closest to historical truth. The central point of the geste du roi is the 11th-century Chanson de Roland (see Roland, LEGEND OF), one of the greatest of medieval poems. Strangely enough the defeat of Roncesvalles, which so deeply impressed the popular mind, has not a corresponding importance in real history. But it chanced to find as its exponent a poet whose genius established a model for his successors, and definitely fixed the type of later heroic poems. The other early chansons to which reference is made are Roland—Epitomes the decisor, whereupon Balian relating to Charlemagne's wars in Italy and Saxony—are not preserved in their original form, and only the first in an early recension. Basin or Carl et Éléagast (preserved in Dutch and Icelandic), the Voyage de Charlemagne à Jerusalem and Le Couronnement Loys also belong to the heroic period. The purely fictitious and romantic tales added to the personal history of Charlemagne and his warriors in the 13th century are inferior in manner, and belong to the decadence of romance. The old tales, very much distorted in the 15th-century prose versions, were to undergo still further degradation in 18th-century compilations.

According to Berte aus grands priés, in the 13th-century reman- ment of the Brabantine trouvère Adené de Li Rois, Charlemagne was the son of Pippin and of Berte, the daughter of Flore and Blanchelle, king and queen of Hungary. The tale bears marks of high antiquity, and presents one of the few incidents in the French cycle which may be referred to a mythic origin. On the night of Berte's marriage a slave, Margist, is substituted for her, and reigns in her place for nine years, at the expiration of which Blanchelle exposes the deceiver; whereupon Berte is rescued from her reign in the forest to her rightful place as queen. Mainie (12th century) and the kindred poems in German and Italian are perhaps based on the adventures of Charles Martel, who after his father's death had to flee to the Ardennes. They relate that, after the death of his parents, Charles was driven by the machinations of the two sons of Margist to take refuge in Spain, where he accomplished his enfances (youthful exploits) with the Mussulman king Galafre under the feigned name of Mainet. He delivered Rome from the besieging Saracens, and returned to France in triumph. But his wife Galienne, daughter of Galafre, whom he had converted to the Christian faith, died on her way to regain him. Charlemagne then made an expedition to Italy (Enfances Ogier in the Venetian Charlesmane, and the first part of the Chevalerie Ogier de Dannemarche by Rainbert of Paris, 12th century) to raise the siege of Rome, which was besieged by the Saracen King Cosbrue. He crossed the Alps under the guidance of a white hart, miraculously sent to assist the passage of the army. Aspremoni (12th century) describes a fictitious campaign against the Saracen King Alagant in Calabria, and is chiefly devoted to the enfances of Roland. The wars of Charlemagne with his vassals are described in Giraldi de Roussillon, Renoux de Montauban, recounting the deeds of the four sons of Aymon, Hues de Bordeaux, and in the latter part of the Chevalerie Ogier, which belong properly to the cycle connected with Doon of Mayence.

The account of the pilgrimage of Charlemagne and his twelve paladins to the Holy Sepulchre must in its first form have been earlier than the Crusades, as the patriarch asks the emperor to

---

1 A remnant of the popular poetry contemporary with Charlemagne, called the carolinian, has been thought to be discernible under its Latin translation in the description of a siege during Charlemagne's war against the Saracens, known as the "Fragment from the Hagne" (Pertz, Script. iii. pp. 708-710).

2 The words douze pairs were anglicized in a variety of forms ranging from douzepeers to dospeers. The word even occurred in a singular in the metrical romance of Octavian: "First they sent out a dospeer." At the beginning of the 13th century there existed a widely diffused judicial function and dated possibly from the 11th century, but their prerogatives at the beginning of the 14th century appear to have been mainly ceremonial and decorative.

3 In 1257 the twelve peers were the chiefs of the great feudal provinces, the dukes of Normandy, Burgundy and Aquitaine, the counts of Toulouse, Champagne and Flanders, and six spiritual peers, the archbishop of Reims, the bishops of Laon, Châlons-sur-Marne, Beauvais, Langres and Noyon. (See Du Cange, Glossarium, s.v. "Par").

free Spain, not the Holy Land, from the Saracens. The legend probably originated in a desire to authenticate the relics in the abbey of Saint Denis, supposed to have been brought fictitiously by Charlemagne, and is preserved in a 12th-century romance, "Le Voyage de Charlemagne à Jérusalem et à Constantinople." This journey forms the subject of a window in the cathedral of Chartres, and there was originally a similar one at Saint-Denis. On the way home Charles and his paladins visited the emperor Hugo at Constantinople, where they indulged in a series of gags which they were made to carry out. Galien, a favourite 15th-century romance, was attached to this episode, for Galien was the son of the amours of Olivier with Jacqueline, Hugo's daughter. The traditions of Charlemagne's fights with the Norsemen (Norois, Noriens) are preserved in "Aiquin (12th century), which describes the emperor's reconquest of Armorica from the "Saracen" king Aiquin, and a disaster at Cézembre as terrible in its way as those of Roncesvalles and Alacian. La destruction de Rome is a 15th-century version of the older chanson of the emir Balan, who collected an army in Spain and sailed to France. The defenders were overpowered and the city destroyed before the advent of Charlemagne, who, however, avenged the disaster by a great battle in Spain. The romance of "Fierabras" (13th century), based upon the poem of the 15th century, is expanded by further additions, and it is therefore more plausibly pretended to be a complete history of Charlemagne. The first part represents an episode in Spain three years before Roncesvalles, in which Oliver defeats the Saracen giant Fierabras in single combat, and converts him. The hero of the second part is Gui de Bourgogne, who recovers the relics of the Passion, lost in the siege of Rome. Othinel (12th century) is also pure fiction. L'Entrée en Espagne, preserved in a 14th-century Italian compilation, relates the beginning of the Spanish War, the siege of Pamplona, and the legendary combat of Roland with Ferragus. Charlemagne's march on Saragossa, and the capture of Huesca, Barcelona and Girona, gave rise to La Prise de Pamplune (14th century), based on a lost chanson; and Gui de Bourgogne (12th century) tells how the children of the barons, after appointing Gui as king of France, set out to find and rescue their fathers, who are represented as having been fighting in Spain for twenty-seven years. The Chanson de Roland relates the historic defeat of Roncesvalles on the 15th of August 778, and forms the very crown of the whole Carolingian legend. The two 15th-century romances, Gaidon, by Herbert Luduc de Dammartin, and Amis de Carthage, contain pure poetic additions, and in their narrative, of Spain, and of the establishment of a Frankish kingdom under the rule of Anséis. Charlemagne was recalled from Spain by the news of the outbreak of the Saxons. The contest between Charlemagne and Widukind (Guiteclin) offered abundant epic material. Unfortunately the original Guiteclin is lost, but the legend is preserved in Les Saismes (c. 1300) of Jehan Bodel, which largely occupied the loves of Baudouin and Sibille, the wife of Guiteclin. The adventures of Blanchefleur, wife of Charlemagne, form a variation of the common tale of the innocent wife falsely accused, and are told in Maceaire and in the extant fragments of La Reine Sibille (14th century). After the conquest of the Saracens and the Saxons, the defeat of the Northmen, and the suppression of the feudal revolts, the emperor abdicated in favour of his son Louis (Le Couronnement Loys, 12th century). Charles's harangue to his son is in the best tradition of epic romance. The memory of Roncesvalles haunts him on his death-bed, and at the moment of death he has a vision of Roland.

The mythic element is practically lacking in the French legends, but in Germany some part of the Odin myth was assimilated, as in Charlemagne's story of the constellation of the Great Bear, generally associated with Odin, is Karlswagen in German, and Charles's Wain in English. According to tradition in Hesse, he awaits resurrection, probably symbolic of the triumph of the sun over winter, within the Gudensberg (Hill of Odin). Bavarian tradition asserts that he is seated in the Untersberg in a chair, as in his tomb at Aix-la-Chapelle. His white beard goes on growing, and when it has thrice encircled the stone table before him the end of the world will come; or, according to another version, Charles will arise and after fighting a great battle on the plain of Wals will reign over a new Germany. There were medieval chroniclers who did not fear to assert that Charles rose from the dead to take part in the Crusades. In the MS. Annales S. Stephani Frisingenses (15th century), which formerly belonged to the abbey of Weihenstephan, and is now at Munich, the childhood of Charlemagne is practically the same as that of many mythic heroes. This work, generally known as the chronicle of Weihenstephan, gives among other legends a curious history of the emperor's passion for a dead woman, caused by a charm given to Charles by a serpent to whom he had rendered justice. The charm was finally dropped into a well at Aix, which thenceforward became Charles's favourite residence. The story of Roland's birth from the union of Charles with his sister Gilles, also found in German and Scandinavian versions, has abundant parallels in mythology, and was probably transferred by mythology to Charlemagne.

The Latin chronicle, wrongly ascribed to Turpin (Tilpinus), was written in 1138, is of minor value and is later than the earlier poems of the French cycle, and thus the proper authenticative mention of it is in 1156. Its principal object was to authenticate the relics of St James at Compostella. Alberic Trum Fontium, a monk of the Cistercian monastery of Trois Fontaines in the diocese of Châlons, embodied much poetical fiction in his chronicle (c. 1240). A large section of the Chronique rimée (c. 1243) of Philippe Mousquet is devoted to Charlemagne's exploits. At the beginning of the 14th century Girard of Amiens made a dull compilation known as Charlemagne from the chansons de geste, authentic history and the pseudo-Turpin. La Conquête qui fit le grand roi Charlemagne et Espaignes (pr. 1436) is the same work as the prose compilation of Fierabras (pr. 1478), and Caxton's Lyf of Charles the Grete (1485).

The Charlemagne legend was fully developed in Italy, where it was to have later a great poetic development at the hands of Boiardo, Ariosto and Tasso. There are two important Italian compilations, MS. XIII. of the library of St Mark, Venice (c. 1200), and the Roëi di Francia (c. 1400) of a Florentine writer, Antonio da Barberino (b. 1370), edited by G. Vandelii (Bologna, 1852). The French works of this period are rivaled in importance by the ten branches of the Norse Karlsmagnus saga, written under the reign of Hakon V. This forms a consecutive legendary history of Charles, and is apparently based on earlier versions of the French Charlemagne poems than those which we possess. It thus furnishes a guide to the older forms of stories, and moreover preserves the substance of others which have not survived in their French form. A popular abridgment, the Keiser Karl Magnus Krönike (pr. Malmó, 1534), drawn up in Danish, serves in some cases to complete the earlier work. The 2000 lines of the German Kaiserchronik on the history of Charlemagne belong to the first half of the 12th century, and were perhaps the work of Conrad, the poet of the Ruolantes Lied. The German poet known as the Stricker used the same sources as the author of the chronicle of Weihenstephan for his Karl (c. 1230). The earliest important Spanish version was the Chronica Hispaniae (c. 1284) of Rodrigo de Toledo.

The French and Norman-French chansons circulated as freely in England as in France, and it was therefore not until the period of the early 15th century that English versions were made. The English metrical romances of Charlemagne are—Rowlandes Song (13th century); The Taill of Raif Coliweyr (c. 1475, pr. by R. Lek- preuk, St Andrews, 1472), apparently original; Sir Fersumbras (c. 1380) and the Sowdone of Babylone (c. 1400) from an early version of Fierabras; a fragmentary Roland and Vernagu (Ferragus); two versions of Otuel (Othel), and a Sege of Melayne (c. 1350), forming a prologue to Othel unknown in French.

---

1 For clerical accounts of Charles's voyage to the Holy Land see the Chronicon (c. 968) of Benedict, a monk of St André, and Descriptio quoliter Karoli Magnus clavum et coronam Domini... detulerit, by an 11th-century writer.
BIBLIOGRAPHY.—The most important works on the Charlemagne cycle of romance are:—

CHARLEMAGNE, JEAN ARMAND (1755-1838). French dramatic author, was born at Bourget (Seine) on the 30th of November 1755. Originally intended for the church, he turned first to being a lawyer's clerk and then a soldier. He served in the American War of Independence, and on returning to France (1783) began to employ his pen on economic subjects, and later in writing for the stage. He became the author of a large number of plays, poems and romances, among which may be mentioned the comedies *M. de Cric (Paris, 1733)*, *Le Souper des Jacobins* (1792) and *L'Agitateur* (1796), and *Observations de quelques patriotes sur la nécessité de conserver les monuments de la littérature et des arts* (1794), an essay written in collaboration with M. M. Chardin and Renouard, which induced the Convention to protect books adorned with the coats of arms of their former owners and other treasures from destruction at the hands of the revolutionaries.

He died in Paris on the 6th of March 1838.

CHARLEMONT, CHARLES (1755-1799). Irish statesman, son of the 3rd Viscount Charlemont, was born in Dublin on the 18th of August 1758, and succeeded his father in the viscountcy in 1777. The title of Charlemont was created from Sir Toby Caulfield (1655-1675) of Oxfordshire, England, who was given lands in Ireland, and created Baron Charlemont (the name of a fort on the Blackwater), for his services to King James I. in 1620, and the 1st viscount was the 5th baron (d. 1671), who was advanced by Charles II. Lord Charlemont is historically interesting for his political connexion with Flood and Grattan; he was a cultivated man with literary and artistic tastes, and both in Dublin and in London his amiable character gave him considerable social influence. For various early services in Ireland he was made an earl in 1763, but he disregarded court favours and cordially joined Grattan in 1780 in the assertion of Irish independence. He was president of the volunteer convention in Dublin in November 1783, having taken from the first a leading part in the embodiment of the volunteers; and he was a strong opponent of the proposals for the Union. He died on the 4th of August 1799, his eldest son, who succeeded him, being subsequently (1837) created an English baron.

His Life, by F. Hardy, appeared in 1810.

CHARLEROI (Carolus Rex), a town in the province of Hainault, Belgium. Pop. (1904) 62,548. It was founded in 1666 on the site of a village called Charnoy by the Spanish governor Roderigo and named after his sovereign Charles II. of Spain. Charleroi is the centre of the iron industry of Belgium. It is connected by a canal with Brussels and from its position on the Sambre enjoys facilities of communication by water with France as well as Belgium. It was ceded soon after its foundation to France by the treaty of Aix-la-Chapelle, and Vauban fortified it. During the French occupation the town was considerably extended, and the fortifications were made so strong that Charleroi twice successfully resisted the strenuous attacks of William of Orange. In 1794 Charleroi again fell into the hands of the French, and on this occasion instead of fortifying they dismantled it. In 1816 Charleroi was refortified under Wellington's direction, and it was finally dismantled in 1829. Some portions of the old ramparts are left near the railway station. There is an archaeological museum with a miscellaneous collection of Roman and Frank antiquities.

CHARLEROI, a borough of Washington county, Pennsylvania, U.S.A., on the Monongahela river, near the S.W. corner of the state, and the seat of the county. and of the borough, with a pop. (1900) 5935, (1910) 9915. It is served by the Pennsylvania railway. The surrounding country has good farming land and large coal mines. In 1905 the borough ranked fifth among the cities of the United States in the manufacture of glass (plate-glass, lamp chimneys and bottles), its product (valued at $1,843,068) being 23% of that of the whole country. Charleroi was settled in 1810 and was incorporated in 1891.

CHARLES (Fr. Charles; Span. Carlos; Ital. Carlo; Ger. Karl; derived from O.H.G. Charal, Latinized as Carolus, meaning originally "man": cf. Mod. Ger. Kerl, "fellow," A. s. ceorl, Mod. Eng. "churl"). A masculine proper name. It has been borne by many European princes, notices of the more important of whom are given below in the following order: (1) Roman emperors, (2) kings of England, (3) other kings in the alphabetical order of their states, (4) other reigning princes in the same order, (5) non-reigning princes. Those princes who are known by a name in addition to Charles (Charles Albert, &c.) will be found after the private individuals bearing Charles as a surname.

CHARLES II1 called The BOLD (823-877), Roman emperor and king of the West Franks, was the son of the emperor Louis the Pious and of his second wife Judith and was born in 823. The attempts made by his father to assign him a kingdom, first Alamannia (829), then the country between the Meuse and the Pyrenees (839), at the expense of his half-brothers Lothair and Louis led to a rising on the part of these two (see Louis I., the Pious). The death of the emperor in 840 was the signal for the outbreak of war between his sons. Charles allied himself with his brother Louis the German to resist the pretensions of the emperor Lothair, and the two allies conquered him in the bloody victory of Fontenoy-en-Puisaye (25 June 841). In the following year, the two brothers confirmed their alliance by the celebrated oaths of Strassburg, made by Charles in the Teutonic language spoken by the subjects of Lothair, and by Louis in the Romance tongue of Charles's subjects. The war was brought to an end by the treaty of Verdun (August 843), which gave to Charles the Bold the kingdom of the western Franks, which practically corresponded with what

1 For Charles I., Roman emperor, see Charlemagne; cf. under Charles I. of France below.
is now France, as far as the Meuse, the Saône and the Rhone, with the addition of the Spanish March as far as the Ebro. The first years of his reign were spent in the defence of his father’s kingdom, and during them was considered the system of “confraternal government” of the sons of Louis the Pious, who had various meetings with one another, at Coblenz (848), at Meersen (851), and at Attigny (854). In 858 Louis the German, summoned by the disaffected nobles, invaded the kingdom of Charles, who fled to Burgundy, and was only saved by the help of the bishops, and by the fidelity of the family of the Welfs, who were related to Judith. In 860 he in his turn tried to seize the kingdom of his nephew, Charles of Provence, but met with a repulse. On the death of Lothair II. in 869 he tried to seize his dominions, but by the treaty of Mersen (870) was compelled to share them with Louis the German. Besides this, Charles had to struggle against the incessant rebellions in Aquitaine, against the Bretons, whose revolt was led by their chief Nomnond and Erispao, and who inflicted on the king the defeats of Ballon (845) and Juvardeil (851), and especially against the Normans, who devastated the country in the north of Gaul, the valleys of the Seine and Loire, and even as far as the borders of Auvergne. Charles had several times compelled to purchase their retreat at a heavy price. He has been accused of being incapable of resisting them, but we must take into account the unwillingness of the nobles, who continually refused to join the royal army; moreover, the Frankish army does not seem to have been sufficiently accustomed to war to make any headway against the pirates. At any rate, Charles led various expeditions against the invaders, and tried to put a barrier in their way by having fortified bridges built over all the rivers. In 875, after the death of the emperor Louis II., Charles the Bald, supported by Pope John VIII., descended into Italy, receiving the royal crown at Pavia and the imperial crown at Rome (20th December). But Louis the German, who was also a candidate for the succession of Louis II., revenged himself for Charles’s success by invading and devastating his dominions. Charles was recalled to Gaul, and after the death of Louis the German (28th August 876), in his turn made an attempt to seize his kingdom, but at Andernach met with a shameful defeat (8th October 876). In the meantime, John VIII., who was menaced by the Saracens, was continually urging him to come to Italy, and Charles, after having taken at Quierzy the necessary measures for safeguarding the government of his dominions in his absence, again crossed the Alps, but this expedition had been received with small enthusiasm by the nobles, and even by Boso, Charles’s brother-in-law, who had been entrusted by him with the government of Lombardy, and they refused to come with their men to join the imperial army. At the same time Carolman, son of Louis the German, entered northern Italy. Charles, ill and in great distress, started on his way back to Gaul, and died while crossing the pass of the Mont Cenis on the 5th or 6th of October 877. He was succeeded by his son Louis the Stammerer, the child of Ermentrude, daughter of a count of Orleans, whom he had married in 842, and who died in 869. In 870 he had married Richilde, who was descended from a noble family of Lorraine, but none of the children whom he had by her played a part of any importance. Charles seemed to have been a prince of a very unexceptionable character, and letters, a friend of the church, and capable of the support he could find in the episcopate against his unruly nobles, for he chose his counsellors for preference from among the higher clergy, as in the case of Guenelon of Sens, who betrayed him, or of Hincmar of Reims. But his character and his reign have been judged very variously. The general tendency seems to have been to accept too easily the accounts of the chroniclers of the east Frankish kingdom, which are favourable to Louis the German, and to accuse Charles of cowardice and bad faith. He seems on the contrary not to have lacked activity or decision.

Authorities.—The most important authority for the history of Charles’s reign is represented by the Annales Bertiniani, which were the work of Prudentius, bishop of Troyes, up to 863, then by 882 of the celebrated Hincmar, archbishop of Reims. This prince’s charters are to be found published in the collections of the Académie des Inscriptions, by M. M. Prou. The most complete history of the reign is found in E. Dümmler, Geschichte des ostfränkischen Reiches (3 vols., Leipzig, 1887–1888). See also J. Calmette, La Diplomatie carolingienne du traité de Verdun à la mort de Charles le Chauve (Paris, 1901), and F. Lott, “Une Année du règne de Charles le Chauve,” in Le Moyen-Age, (1902) pp. 393-438.

CHARLES III., THE FAT (837–888), Roman emperor and king of the West Franks, was the youngest of the three sons of Louis the German, and the oldest of the kingdom of Swabia (Alamannia). After the death of his two brothers in arms, Carloman (881) and Louis the Young (882), he inherited the whole of his father’s dominions. In 880 he had helped his two cousins in the west Frankish realm, Louis III. and Carolman, in their struggle with the usurper Boso of Provence, but abandoned them during the campaign in order to be crowned emperor at Rome by Pope John VIII. (February 881). On his return he led an expedition against the Norsemen of Friesland, who were entrenched in their camp at Elsloo, but instead of engaging with them he preferred to make terms and paid them tribute. In 884 the death of Carolman brought into his possession the west Frankish realm, and in 885 he got rid of his rival Hugh of Alsace, an illegitimate son of Lothair II., by making him prisoner by treachery and putting out his eyes. However, in spite of his six expeditions into Italy, he did not succeed in pacifying the country, nor in delivering it from the Saracens. He was equally unfortunate in Gaul and in Germany against the Norsemen, who in 866–887 became known as the Norsemen of Christmas. The Duke of Spoleto rebelled against the city with a large army (October 886), but contented himself by treating with them, buying the retreat of the invaders at the price of a heavy ransom, and his permission for them to ravage Burgundy without his interfering. On his return to Alamannia, however, the general discontent showed itself openly and a conspiracy was formed against him. He was first forced to dismiss his favourite, the chancellor Liutward, bishop of Vercelli. The dissolution of his marriage with the pious empress Richarde, in spite of her innocence as proved by the judicial examination, alienated his nobles still more from him. He was deposed by an assembly which met at Frankfort or at. Tribur (November 887), and died in poverty at Neidlingen on the Danube (18th January 888).

CHARLES IV. (1316–1378), Roman emperor and king of Bohemia, was the eldest son of John of Luxembourg, king of Bohemia, and Elizabeth, sister of Wenceslas III., the last Bohemian king of the Premyslid dynasty. He was born at Prague on the 14th of May 1316, and in 1323 went to the court of his uncle, Charles IV., king of France, and exchanged his baptismal name of Wenceslas for that of Charles. He remained for seven years in France, where he was well educated and learnt five languages; and there he married Blanche, sister of King Philip VI., the successor of Charles IV. In 1331 he gained some experience of warfare in Italy with his father; and on his return to Bohemia in 1333 he was made margrave of Moravia. Three years later he undertook the government of Tirol on behalf of his brother John Henry, and was soon actively concerned in a struggle for the possession of this county. In consequence of an alliance between his father and Pope Clement VI., the relentless enemy of the emperor Louis IV., Charles was chosen German king in opposition to Louis by some of the princes at Reine on the 11th of July 1346. As he had previously promised to be subservient to Clement he made extensive concessions to the pope in 1347. Confirming the papacy in the possession of wide territories, he promised to uphold the acts of Louis against Clement, to take no part in Italian affairs, and to defend and protect the church. Meanwhile he had accompanied his father into France and had taken part in the battle of Crecy in August 1346, when John was killed and Charles escaped wounded from the field. As king of Bohemia he returned to Germany, and after being crowned German king at Bonn on the 26th of November 1346, prepared to attack Louis. Hostilities were interrupted by the death of the emperor in October 1347, and Günther, count of Schwarzburg, who was chosen king by the

IN 1350 THE KING WAS VISITED AT PRAGUE BY COLA DI RENZI, WHO URGED HIM TO GO TO ITALY, WHERE THE POET PETRARCA AND THE CITIZENS OF FLORENCE ALSO IMPOSED HIS PRESENCE. TURNING A DEAF EAR TO THESE ENTREATIES, CHARLES KEPT RENZI IN PRISON FOR A YEAR, AND THEN HANDED HIM TO A PRIEST AS A PRISONER TO AVIGNON. FOUR YEARS LATER, HOWEVER, HE CROSSED THE ALPS WITHOUT AN ARMY, RECEIVED THE LOMBARD CROWN AT MILAN ON THE 6TH OF JANUARY 1355, AND WAS CROWNED EMPEROR AT ROME BY A CARDINAL ON THE 5TH OF APRIL IN THE SAME YEAR. HIS SOLE OBJECT APPEARS TO HAVE BEEN TO OBTAIN THE IMPERIAL CROWN IN PEACE, AND IN ACCORDANCE WITH A PROMISE PREVIOUSLY MADE TO POPE CLEMENT VII.

ON HIS RETURN CHARLES WAS OCCUPIED WITH THE ADMINISTRATION OF GERMANY, THEN JUST RECOVERING FROM THE BLACK DEATH, AND IN 1356 HE PROMULGATED THE GOLDEN BULL (G.B.) TO REGULATE THE ELECTION OF THE KING. HAVING GIVEN MORAVIA TO ONE BROTHER, JOHN HENRY, AND ERECTED THE COUNTY OF LUXEMBOURG INTO A DUCY FOR ANOTHER, WENCESLAUS, HE WAS UNREMITTING IN HIS EFFORTS TO SECURE OTHER TERRITORIES AS COMPENSATION AND TO STRENGTHEN THE BOHEMIAN MONARCHY. TO THIS END HE PURCHASED PART OF THE UPPER PALATINATE OF THE RHINE IN 1353, AND IN 1367 ANNEXED LOWER LUSATIA TO BOHEMIA AND BOUGHT NUMEROUS ESTATES IN VARIOUS PARTS OF GERMANY. ON THE 13TH OF JOY 1363, HE DISPOSED OF A CONSIDERABLE PORTION OF THE AUSTRIAN TERRITORY TO THE HABSBURG FAMILY, AT THE ASSESSMENT OF 50,000 TARGARS. THIS DECISION WAS MADE IN CONSULTATION WITH HIS FRIENDS, AND WAS PARTIALLY INHERITED THROUGH HIS THIRD WIFE, ANNA, DAUGHTER OF HENRY II., DUKE OF SCHWEINITZ. IN 1365 CHARLES VISITED POPE URBAN V. AT AVIGNON AND UNDERTOOK TO ESCORT HIM TO ROME; AND ON THE SAME OCCASION WAS CROWNED KING OF BURGUNDY, OR ARLES, AT ARLES ON THE 4TH OF JUNE 1365.

CHARLES, WHO ACCORDING TO THE EMPEROR MAXIMILIAN I. WAS THE STEP-FATHER OF THE EMPIRE, BUT THE FATHER OF BOHEMIA, BROUGHT THE LATTER COUNTRY TO A HIGH STATE OF PROSPERITY. HE REFORMED THE FINANCES, CAUSED ROADS TO BE MADE, PROVIDED FOR GREATER SECURITY IN TIMES OF TROUBLE, AND INTRODUCED NEW METHODS AND MACHINERY INTO THE STATIONS OF INDUSTRY. IN 1348 HE FOUNDED THE UNIVERSITY OF PRAGUE, AND AFTERWARDS MADE THIS CITY THE SEAT OF AN ARCHBISHOP, AND BEAUTIFIED IT BY THE ERECTION OF SEVERAL FINE BUILDINGS. HE WAS AN ACCOMPLISHED DIPLOMATIST, POSSESSED A PENETRATING INTELLECT, AND WAS CAPABLE OF MUCH TRICKERY IN ORDER TO GAIN HIS ENDS. BY REFUSING TO BECOME ENTANGLED IN ITALIAN TROUBLES AND CONFIRMING HIMSELF TO BOHEMIA, HE PROVED THAT HE PREFERRED THE SUBSTANCE OF POWER TO ITS SHADOW. APPARENTLY THE MOST PLANT OF MEN, HE HAD IN REALITY A GREAT PERSISTENCE OF CHARACTER, AND IF FOILED IN ONE SET OF PLANS READILY TURNED ROUND AND REACHED HIS GOAL BY A TOTAL DIFFERENT PATH. HE WAS SUPERSTITIOUS AND PEACE-LYING HAVING A PERSONAL WANTS, AND IS DESCRIBED AS A ROUND-SHAPED MAN OF MEDIUM HEIGHT, WITH BLACK HAIR AND BEARD, AND SLACK SLEEVES.

His autobiography the "Vita Caroli IV." which deals with events down to the year 1346, and various other documents relating to his life and times, are published in the Fontes rerum Germanicarum, Basle, 1837, edited by J. F. Böhmer (Leipzig, 1835). Other documents relating to the time see Die Regesten des Kaiserreichs unter Kaiser Karl IV., edited by J. F. Böhmer and A. Huber (Innsbruck, 1880); Acta Caroli IV. imperatoris inedita (Innsbruck, 1891); E. von Symsperer, Excerpta regium Clementis V. historia (Innsbruck, 1888). See also E. Wurmsky, Geschichte Kaiser Karl IV. und seiner Zeit (Innsbruck, 1880-1892); H. Friedjung, Kaiser Karl IV. und sein Anlieh am geistigen Leben seiner Zeit (Vienna, 1870); A. CHARLES V. (1500-1558), Roman emperor and (as Charles I.) King of Spain, was born at Ghent on the 24th of February 1500. His parents were Philip of Burgundy and Joanna, third child of Ferdinand and Isabella. Philip died in 1506, and Charles succeeded to his Hapsburg possessions and the country of Burgundy (Franche Comté). His grandfather, the emperor Maximilian, as regent, appointed his daughter Margaret vice-regent, and under her strenuous guardianship Charles lived in the Netherlands until the estates declared him in 1515. In Castile, Ferdinand, King of Aragon, acted as regent for his daughter Joanna, whose intellect was already clouded. On the 23rd of January 1516 Ferdinand died. Charles's visit to Spain was delayed until the autumn of 1517, and only in 1528 was he formally recognized as king conjointly with his mother, firstly by the cortes of Castile, and then by those of Aragon. Joanna lived to the very eve of her son's abdication, so that he was only for some months technically sole king of Spain. During this Spanish visit Maximilian died, and Charles succeeded to the inheritance of the Hapsburgs, to which was shortly added the duchy of Württemberg. Maximilian had also intended that he should succeed as emperor. In spite of the formidable rivalry of Francis I. and the opposition of Pope Clement VII., Charles united and national feeling combined to secure his election in 1519. Charles hurriedly left Spain, and after a visit to Henry VIII. and his aunt Catherine, was crowned at Aix on the 23rd of October 1520.

The difficulty of Charles's reign consists in the complexity of interests caused by the unnatural aggregate of distinct territories and races. The crown of Castile brought with it the two recently conquered kingdoms of Navarre and Granada, together with the new colonies in America and scattered possessions in northern Africa. That of Aragon comprised the three distinct states of Aragon, Valencia, and Catalonia, and in addition the kingdoms of Naples, Sicily and Sardinia, each with a separate character and constitution of its own. No less than eight independent cortes or parliaments existed in this Spanish-Italian group, adding greatly to the intricacy of government. In the Netherlands provinces again the tie was almost purely personal; there existed only the rudiments of a central administration and a common representative system, while the country of Burgundy had a history apart. Much the same was true of the Hapsburg group as a whole, but Charles was freed from direct responsibility for their governmen and making them over, together with Württemberg, to his brother Ferdinand. The Empire entailed serious liabilities on its ruler without furnishing any reliable assets: only through the cumbersome machinery of the diet could Charles tap the military and financial resources of Germany. His problem here was complicated by the growth of Lutheranism, which he had to face at his very first diet in 1521.

In addition to such administrative difficulties Charles had
inherited a quarrel with France, to which the rivalry of Francis I. for the Empire gave a personal character. Almost equally formidable was the advance of Sultan Suliman upon the Danube, and the union of the Turkish naval power with that of the Barbaric States of northern Africa. Against Lutheran Germany the Catholic emperor might hope to rely upon the pope, and against France on England. But the attitude of the popes was almost unanimously disagreeable, while from Henry VIII. and Edward VI. Charles met with more unpleasantness than favour.

The difficulty of Charles himself is also that of the historian and reader of his reign. It is probably more instructive to treat it according to the emperor's several problems than in strict chronological order. Yet an attempt to distinguish the several periods of his career may serve as a useful introduction. The two best dividing lines are, perhaps, the coronation as emperor at Bologna in 1530, and the peace of Crépy in 1544. Until his visit to Italy (1529) Charles remained in the background of the European stage, except for his momentous meeting with Luther at the diet of Worms (1521). This meeting in itself forms a subdivision. Previously to this, during his nominal rule in the Netherlands, his visit to Spain, and his conduct for the Empire, he seemed, as it was said, spell-bound under the ferule of his minister Chièvres. Almost every report represented him as colourless, reserved and weak. His dependence on his Flemish counsellors provoked the rising in Castile, the feebleness of his government the social war in Aragon. The religious question first gave him a living interest, and at this moment Chièvres died. Aleander, the papal nuncio at Worms, now recognized that public opinion had been wrong in its estimate of Charles. Never again was he under tutelage. The necessity, however, of residence in Spain prevented his taking a personal part in the great fight with Francis I. for Italy. He could claim no credit for the capture of his rival at Pavia. When his army sacked Rome and held Pope Clement VII. prisoner, he could not have known where this army was. And when later the French overran Naples, and all but deprived him of his hold on Italy, he had to instruct his generals that they must shift for themselves. The world had become afraid of him, but knew little of his character. In the second main division of his career Charles changed his front. No monarch until Napoleon was so widely seen in Europe and in Africa. Complexity of problems is the characteristic of this period. At the head of his army Charles forced the Turks backwards down the Danube (1532). He personally conquered Tunis (1535), and was only prevented by "act of God" from winning Algiers (1541). The invasion of Provence in 1536 was headed by the emperor. In person he crushed the rebellion of Ghent (1540). In his last war with Francis (1542-44) he journeyed from Spain to the Netherlands, brought the rebellious duke of Cleves to his knees, and was within easy reach of Paris when he made the peace of Crépy (1544). In Germany, meanwhile, from the diet of Augsburg (1530) onwards, he had presided at the diets or conferences, which, as he hoped, would effect the reunion of the church.

Peace with France and the Turk and a short spell of friendliness with Pope Paul III. enabled Charles at last to devote his whole energies to the healing of religious schism. Conciliation proving impossible, he led the army which received the submission of the Lutheran states, and then captured the elector of Saxony at Mühlberg, after which the other leader, Philip of Hesse, capitulated. The Armed Diet of 1548 was the high-water mark of Charles's power. Here, in defiance of the pope, he published the Interim which was meant to reconcile the Lutherans with the church, and the so-called Reform which was to amend its abuses. During the next four years, owing to ill-health and loss of insight, his power was ebbing. In 1543 he was flying over the Brenner from Maurice of Saxony, a princeling whose fortunes he had made. Once again the old complications had arisen. His old enemy's son, Henry II., had attacked him indirectly in Piedmont and Parma, and then directly in Germany in alliance with Maurice. Once more the Turk was moving in the Danube and in the western Mediterranean. The humiliation of his flight gave Charles new spirit, and he once more led an army through Germany against the French, only to be checked by the duke of Guise's defence of Metz. Henceforth the waves of his fortune plashed to and fro until his abdication without much ostensible loss or gain.

Charles had abundance of good sense, but little creative genius, and he was by nature conservative. Consequently he never sought to impose any new or common principles of administration on his several states. He took them as he found them, and at most, as in the Netherlands, improved upon what he found. So also in dealing with rival powers his policy may be called opportunistic. He was indeed accused by his enemies of emulating Charlemagne, of aiming at universal empire. Historians have frequently repeated this charge. Charles himself in later life laughingly denied the imputation, and facts are in favour of his denial. When Francis I. was in his power he made no attempt to dismember France, in spite of his pledges to his allies Henry VIII. and the duke of Bourbon. He did, indeed, demand the duchy of Burgundy, because he believed this to have been unrighteously stolen by Louis XI. from his grandmother when a helpless girl. The claim was not pressed, and at the height of his fortunes in 1548 he advised his son never to surrender it, but also never to attempt to conquer it. Against the Turks, Charles II., was his prisoner, he was vehemently urged to overturn the temporal power, to restore imperial dominion in Italy, at least to make the papacy harmless for the future. In reply he restored his enemy to the whole of his dominions, even reimposing him by force on the Florentine republic. To the end of his life his conscience was sensitive as to Ferdinand's expulsion of the house of Albrecht from Spanish Navarre, though this was essential to the safety of Spain. Though always at war he was essentially a lover of peace, and all his wars were virtually defensive. "Not greedy of territory," wrote Marcantonio Contarini in 1536, "but most greedy of peace and quiet." So for peace he made sacrifices which angered his hot-headed brother Ferdinand. He would not aid in expelling the sultan's puppet Zappolya from Ferdinand's kingdom of Hungary, and he suffered the restoration of the Habsburg dukedom of Württemberg, to the grave prejudice of German Catholicism. In spite of his protests, Henry VIII. with impunity ill-treated his aunt Catherine, and the feeble government of Edward VI. bullied his cousin Mary, who had been his fiancée. In 1533 Charles was made to restore his brother-in-law, Christian II., to the throne of Denmark, and he advised his son Philip to make friends with the usurper. After the defeat of the Lutheran powers in 1547 he did not gain a palm's breadth of territory for himself. He resisted Ferdinand's claim for Württemberg, which the duke had desired to forfeit; he disliked his acceptance of the voluntary surrender of the city of Constance; he would not have it said that he had gone to war for the benefit of the house of Habsburg.

On the other hand, Charles V.'s policy was not merely negative. He enlarged upon the old Habsburg practice of marriage as a means of alliance of influence. Previously to his election as emperor, his sister Isabella was married to Christian II. of Denmark, and the marriages of Mary and Ferdinand with the king of Hungary and his sister had been arranged. Before he was twenty Charles himself had been engaged some ten times with a view to political combinations. Naturally, therefore, he regarded his near relations as diplomatic assets. The federative system was equally familiar; Germany, the Netherlands, and even Spain, were in a measure federations. Combining these two principles he would within his more immediate spheres of influence strengthen existing federations by internal marriages, while he hoped that the same means would convert the jarring powers of Europe into a happy family. He made it a condition of the treaty of Madrid (1526) that Francis I. should marry his sister Eleanor, Manuel of Portugal's widow, in the hope, not that she would be an ally or a spy within the enemy's camp, but an instrument of peace. His son's marriage with Mary Tudor would not only solve the rube with England, but give such absolute security to the Netherlands that France would shrink from war. The personal union of all the Iberian kingdoms under a single ruler had long been an aim of Spanish statecraft. So Charles had married his sister Eleanor, much against her will, to the old king Manuel, and then his sister Catherine to his successor. The emperor was a Portuguese.
infanta, and Philip's first wife was another. It is thus small wonder that, within a quarter of a century of Charles's death, Philip became king of Portugal.

In the wars with Francis I, Italy was the stake. In spite of his success Charles for long made no direct conquests. He would convert the peninsula into a federation mainly-foneral. Savoy, the important buffer state, was detached from France by the marriage of the somewhat feeble duke to Charles's capable and devoted sister-in-law, Beatrice of Portugal. Milan, conquered from France, was granted to Francesco Sforza, heir of the old dynasty, and even after his treason was restored to him. In the vain hope of offspring Charles sacrificed his niece, Christina of Denmark, to the valetudinarian duke. In the long negotiations for a Habsburg-Valois dynasty which followed Francesco's death, Charles was probably sincere. He insisted that his daughter or niece should marry the third rather than the second son of Francis I, in order, apart from other reasons, to run less risk of the duchy falling under French dominion. The final investiture of Philip was forced upon him, and does not represent his true policy. The Medici of Florence, the Gonzaga of Mantua, the papal house of Farnese, were all attached by Habsburg intrigue to the French party, however recently it had been drawn into the circle through the agency of their chief noble families, the Doria and Piccolomini; while Charles behaved with scrupulous moderation towards Venice in spite of her active hostility before and after the League of Cognac. Occasional acts of violence there were, such as the participation in the murder of Pierluigi Farnese, and the measures which provoked the rebellion of Siena. These were due to the difficulty of controlling the imperial agents from a distance, and in part to the faults of the victim prince and republic. On the whole, the loose federation of vicerealties and principalities harmonized with Italian interests and traditions. The alternative was not Italian independence, but French domination. At any rate, Charles's structure was so durable that the French met with no real success in Italy until the 16th century.

Germany offered a fine field for a creative intellect, since the evils of her disintegration stood confessed. On the other hand, princes and towns were so jealous of an increase of central authority that Charles, at least until his victory over the League of Schmalkalden, had little effective power. Owing to his wars with French and Turks he was rarely in Germany, and his visits were very short. His problem was infinitely complicated by the union of Lutheranism and princely independence. He fell back on the old policy of Maximilian, and strove to create a party by personal alliances and intermarriage. In this he met with some success. The friendship of the electors of Brandenburg, whether Catholic or Protestant, was unbroken. In the war of Schmalkalden half the Protestant princes were on Charles's side or friendly neutrals. At the critical moment which preceded this, the lately rebellious duke of Cleves and the heir of Bavaria were secured through the agency of two of Ferdinand's invaluable daughters. The relations, indeed, between the two old enemies, Austria and Bavaria, were permanently improved. The elector palatine, whose love affairs with his sister Eleanor Charles as a boy had roughly broken, received in compensation a Danish niece. Her sister, widow of Francesco Sforza, was utilized to gain a hold upon the French dynasty which ruled Lombardy. More than once there were proposals for winning the hostile house of Saxon by matrimonial means. After his victory over the League of Schmalkalden, Charles perhaps had really a chance of making the imperial power a reality. But he lacked either courage or imagination, contenting himself with proposals for voluntary association on the lines of the defunct Swabian League, and dropping even these when public opinion was against them.

Now, too, he made his great mistake in attempting to foist Philip upon the Empire as Ferdinand's successor. Gossip reported that Ferdinand himself was to be set aside, and careless historians have given currency to this. Such an idea was impossible. Charles wished Philip to succeed Ferdinand, while he ultimately conceded that Ferdinand's son Maximilian should follow Philip, and even in his lifetime exercise the practical power in Germany. This scheme irritated Ferdinand and his popular and ambitious son at the critical moment when it was essential that the Habsburgs should hold together against princely malcontents. Philip was imprudently introduced to Germany, which had also just received a foretaste of the unpleasant characteristics of Spanish troops. Yet the person rather than the policy was, perhaps, at fault. It was natural that the quasi-hereditary succession should revert to the elder line. France proved her recuperative power by the occupation of Savoy and of Metz, Toul and Verdun, the military keys of Lorraine. The separation of the Empire and Spain left two weakened powers not always at accord, and neither of them permanently able to cope on equal terms with France. Nevertheless, this scheme did contribute in no small measure to the failure of Charles in Germany. The main cause was, of course, the religious schism, but his treatment of this requires separate consideration.

The characteristics of Charles's government, its mingled conservativeness and adaptability, are best seen in Spain and the Netherlands, with which he was in closer personal contact than with Italy and Germany. In Spain, when once he knew the country, he under-represented his autocratic spirit with such equal caution and forethought that the rising of the comuneros was probably caused by the rising of the comuneros. The cortes of Castile were regularly summoned, and though he would allow no encroachment on the crown's prerogatives, he was equally scrupulous in respecting their constitutional rights. They became, perhaps, during the reign slightly more dependent on the crown. This has been ascribed to the system of gratuities which in later reigns became a scandal, but was not introduced by Charles, and as yet amounted to little more than the payment of members' expenses. Indirectly, crown influence increased owing to the greater control which had gradually been exercised over the composition of the municipal councils, which often returned the deputies for the cortes. Charles was throughout nervous as to the power and wealth of the greater nobles. They rather than the crown had conquered the communes, and in the past they rather than the towns had been the enemies of monarchy. He earnestly warned his son against giving them administrative power, especially the duke of Alva, who in spite of his sanctimonious and humbug bearing cherished the highest ambitions: in foreign affairs and war he might be freely his father, but was Spain's best soldier. In the cortes of 1538 Charles came into collision with the nobles as a class. They usually attended only on ceremonial occasions, since they were exempted from direct taxation, which was the main function of the cortes. Now, however, they were summoned, because Charles was bent upon a scheme of indirect taxation which would have affected all classes. They offered an uncompromising opposition, and Charles somewhat angrily dismissed them, nor did he ever summon them again. The peculiar Spanish system of departmental councils was further developed, so that it may be said that the bureaucratic element was slightly increasing just as the parliamentary element was on the wane. The evils of this tendency were as yet scarcely apparent owing to Charles's personal intervention in all departments. The councils presented their reports through the minister chiefly concerned; Charles heard their advice, and formed his own conclusions. He impressed upon Philip that he should never become the servant of his ministers, but let him hear them all but decide himself. Naturally enough he was well served by his ministers, whom he very rarely changed. After the death of the Piedmontese Gattinara he relied mainly on Nicolas Perrenot de Granvella for Netherlands and German affairs, and on Francisco de los Cobos for Spanish, while the younger Granvella was being trained. From 1520 to 1555 these were the only ministers of high importance. Above all, Charles never had a court favourite, and the only women who exercised any influence were his natural advisers, his wife, his aunt Margaret and his sister Mary. In all these ladies he was peculiarly fortunate. Charles was never quite popular in Spain, but the empress whom he married at his people's request was much beloved. Complaints were made of his absenteeism, but until 1543 he spent the greater portion of his reign in Spain, or on expeditions.
such as those against Tunis and Algiers which were distinctively in Spanish interests. Spaniards disliked his Netherland and German connexions, but without the vigorous blows which these enabled him to strike at France, it is improbable that Spain could have retained her hold on Italy, or her monopoly of commerce with the Indies. The wars with Francis I were, in spite of the rival candidature for the Empire, Spanish wars entailed by Ferdinand's retention of Roussillon, his annexation of Navarre, his summary eviction of the French from Naples. The Netherlands had become convinced on commercial grounds of the wisdom of peace with France, and the German interest in Milan was not sufficiently active to be a standing cause of war. Charles and Francis had inherited the hostility of Ferdinand and Louis XII.

The reign of Charles was in America the age of conquest and organisation. Upon his accession the settlements upon the mainland were insignificant; by 1556 conquest was practically complete, and civil and ecclesiastical government firmly established. Actual expansion was the work of great adventurers starting on their own impulse from the older colonies. To Charles fell the task of encouraging such ventures, of controlling the conquerors, of settling the relations between colonists and natives, which involved those between the colonists and the missionary colonial church. He must arrest depopulation, provide for the labour market, regulate oceanic trade, and check military preponderance by civil and ecclesiastical organization. In America Charles took an unceasing interest; he had a boundless belief in its possibilities, and a determination to safeguard the interests of the crown. Cortes, Alvarado and the brothers Pizarro were brought into close personal communication with the emperor. If he bestowed on Cortes the confidence which the loyal conqueror deserved, he showed the sternest determination in crushing the rebellious and autonomous instincts of Almagro and the Pizarros. But for this, Peru and Chile must have become independent colonies as soon as they were conquered. Throughout he strove to protect the natives, to prevent actual slavery, and the consequent raids upon the natives. Legislation was not, indeed, always consistent, because the claims of the colonists could not always be resisted, but on the whole he gave earnest support to the missionaries, who upheld the cause of the natives against the military, and sometimes the civil and ecclesiastical elements. His humane care for his native subjects may well be studied in the instructions sent to Philip from Germany in 1548, when Charles was at the summit of his power. If Charles had had his will, he would have opened the colonial trade to the whole of his wide possessions. The Castilians, however, jealously confined it to the city of Seville, artificially fostering the indolence of the colonists to maintain the agricultural and manufacturing monopoly of Castle, and by extreme protective measures forcing them to live on smuggled goods from other countries. Charles did actually secure the exclusive interest of the colonists in mineral wealth by the establishment of peasant and artisan colonies. If in many respects he failed, yet the organization of Spanish America and the survival of the native races were perhaps the most permanent results of his reign. It is a proof of the complexity of his interests that the march of the Turk upon Vienna and of the French on Naples delayed until the following reign the foundation of Spain's eastern empire. Charles carefully organized the expeditions of Magellan, which sailed for the Moluccas and discovered the Philippines. Unfortunately, his straits for money in 1529 compelled him to mortgage to Portugal his disputed claim to the Moluccas, and the Philippines consequently dropped out of sight.

If in the administration of Spain Charles did little more than mark time, in the Netherlands advance was rapid. Of the seven northern provinces he added five, containing more than half the area of the later United Provinces. In the south he freed Flanders and Artois from French suzerainty, annexed Tournai and Cambrai, and closed the natural line of French advance through the great bishopric of Liége by a line of fortresses across its western frontier. Much was done to convert the aggregate of jarring provinces into a harmonious unity by means of common principles of law and finance, and by the creation of a national army. While every province had its own assembly, there were at Charles's accession only the rudiments of estates general for the Netherlands at large. At the close of the reign the common parliamentary system was in full swing, and was fast converting the loosely knit provinces into a state. By these means the ruler had wished to facilitate the process of supply, but supply soon entailed redress, and the provinces could recognize their common interests and grievances. Under Philip II all patriotic spirits passionately turned to this creation of his father as the palladium of Netherland liberty. This process of consolidation was infinitely difficult, and conflicts between local and central authorities were frequent. That they were safely tided over was due to Charles's moderation and his legal mind, which prompted him to draw back when his case was bad. The harshest act of his life was the punishment of the rebellion of Ghent. Yet the city met with little or no sympathy in other quarters, because she had refused to act in concert with the other members of Flanders and the other provinces. It was no mere local quarrel, but a breach of the growing national unity.

In the Netherlands Charles showed none of the jealousy with which he regarded the Spanish nobles. He encouraged the growth of large estates through primogeniture; he gave the nobles the provincial governorships, the great court offices, the command of the professional cavalry. In the Order of the Golden Fleece and the long established presence of the court at Brussels, he possessed advantages which he lacked in Spain. The nobility were utilized as a link between the court and the provinces. Very different was it with the church. By far the greater part of the Netherlands fell under foreign sees, which were peculiarly liable to papal exactions and to the intrigues of rival powers. Thus the usual conflict between civil and ecclesiastical jurisdiction was peculiarly acute. To remedy this dualism of authority, and the consequent moral and religious abuses, Charles early devised the creation of a national diocesan system, and this was a darling project throughout his life. He was doing what every German territorial prince, Catholic or Lutheran, attempted, making bishoprics and abbies dependent on the crown, with nomination and institution in his hands, and with reasonable control over taxation and jurisdiction. The papacy unfortunately thwarted him, and the scheme, which under Charles would have been carried with national assent, and created a national church, took the appearance under Philip of alien domination.

If in Germany Charles was emperor, he was in the Netherlands territorial prince, and thus his interests might easily be at discord with those of the Empire. Consequently, just as he had shaken off French suzerainty from Flanders and Artois, so he loosened the tie of the other provinces to Germany. In 1548 they were declared free and sovereign principalities not subject to foreign laws, and all the territories were incorporated in the Burgundian circle. It was, indeed, agreed that they should contribute to imperial taxation, and in return receive imperial protection. But this soon became a dead letter, and the Netherlands were really severed from the Empire, save for the nominal feudal tie in the case of some provinces. Thus some writers have dated their independence from Charles's convention of 1548 rather than from the peace of Westphalia, a century later. Having converted his heterogeneous territories into a self-sufficient state, Charles often contemplated the formation of a middle kingdom between France and Germany. At the last moment he spoiled his own work by granting the Netherlands to Philip. It was indeed hard to set aside the order of inheritance, and the commercial interests of the provinces were closely bound with Spain, and with England, whose queen Philip had married. Under any other ruler than Philip the breach might not have come so early. Yet it must be regretted that Charles had not the courage of his convictions, and that he lost the opportunity of completing the new nation which he had faithfully laboured to create.

Charles V. is in the eyes of many the very picture of a Catholic zealot. Popular opinion is probably mainly based upon the
letters written from Yuste in 1558, when two hot-beds of heresy had been discovered in Spain herself, and on the contemporary continent to the north. Oriental influence, perhaps, really in part responsible for the latter persecution. Yet the circumstances were far from being typical of the emperor's career. Death was very near him; devotional exercises were his main occupation. The letters, moreover, were cries of warning, and not edicts. Charles was not then the responsible authority. There is a long step between a violent letter and a violent act. Few men would care to have their lives judged by letters written in the last extremities of gout. Less pardonable was the earlier persecution of the Valencian Moriscoes in 1525-1526. They had fought for their landlords in the cause of order, had been forcibly converted by the revolutionaries, and on the suppression of revolution had naturally relapsed. But for this momentary conversion the Inquisition would have had no hold upon them. The edict of persecution was cruel and unnecessary, and all expert opinion in Valencia was against it. It was not, however, actually enforced until after the victory of Pavia. It seems likely that Charles in a fit of religious exaltation regarded the persecution as a sacrificial self-offering for his moral redemption. It is characteristic that, when in the following year he was brought into personal contact with the Moors of Granada, he allowed them to buy themselves off from the more obvious measures of the Inquisition. Henceforth the reign was marked by extreme leniency. Spain enjoyed a long lull in the activity of her Inquisition. At Naples in 1547 a rumour that the Spanish Inquisition was to be introduced to check the growth of heresy in influential quarters produced a dangerous revolt. The briefs were, however, issued by Paul III., no friend of Charles, and when a Neapolitan deputation visited the emperor he disclaimed any intention of making innovations. Of a different type to all the above was the persecution in the Netherlands. Here it was deliberate, chronic, and on an ascending scale. It is not a sufficient explanation that heresy also was persistent, ubiquitous and increasing, for this was also the case in Germany where Charles's methods were neither uniform nor drastic. But in the Netherlands the heretics were his immediate subjects, and as in every other state, Catholic or Lutheran, they must conform to their prince's religion. But there was more than this. After the suppression of the German peasant revolt in 1525 many of the refugees found shelter in the teeming Netherlandic cities, and heresy took the form, not of Lutheranism, but of Anabaptism, which believed to be perilous to society and the state. The government put down Anabaptism, as a modern government might stamp out Anarchism. The edicts were, indeed, directed against heresy in general, and as harsh as they could be—je ne sais quoi paper. Yet when Charles was assurred that they were embarrassing foreign trade he let it be understood that they should not affect the foreign mercantile communities. Prudential considerations proved frequently a drag upon religious zeal. The relations of Charles to heresy must be judged in the main by his treatment of German Lutheranism. Here he had to deal, not with drawing-room impurities nor hole-and-corner conversions nor millenary aspirations, but with organized churches protected by their princes, supported by revenues filched from his own church and stiffened by formulae as rigid as those of Catholicism. The length and stubbornness of the conflict will serve to show that Charles's religious conservatism had a measure of elasticity, that he was not a bigot and nothing more. It should be remembered that all his principal ministers were inclined to be Erasmian or indifferent, that one of his favourite confessors, Loayza, advised compromise, and that several intimate members of his court and chapel were, after his death, victims of the Inquisition. The two more obvious courses towards the restoration of Catholic unity were force and reconciliation, in other words, a religious war or a general council. Neither of these was a simple remedy. The latter was impossible without papal concurrence, inoperative without the assistance of the European powers, and merely irritable without the adhesion of the Lutherans. It was most improbable that the papa, the powers and the Lutherans would combine in a measure so palpably advantageous to the emperor. Force was hopeless save in the absence of war with France and the Turk, and of papal hostility in Italian territorial politics. Charles must obtain subsidies from ecclesiastical sources, and the support of all German Catholics, especially of the traditional rival, Bavaria. Even so the Protestants would probably be the stronger, and therefore they must be divided by utilizing any religious split, any class distinction, any personal or traditional dislikes, or else by bribery. Force and reconciliation seeming equally difficult, could an alternative be found in toleration? The experiment might take the form either of individual toleration, or of toleration for the Lutheran states. The former would be equally objectionable to Lutheran and Catholic princes as loosening their grip upon their subjects. Territorial toleration might seem equally obnoxious to the emperor, for its recognition would strengthen the anti-imperial particularism so closely associated with Lutheranism. If Charles could find no permanent specific, he must apply a provisional palliative. It was absolutely necessary to patch, if not to cure, because Germany must be pulled together to resist French and Turks. Such palliatives were a sign of suspension and comprehension. Suspension deferred the execution of penalties incurred by heresy, either for a term of years, or until a council should decide. Thus it recognized the divorce of the two religions, but limited it by time. Comprehension instead of recognizing the divorce would strive to conceal the breach. It was a domestic remedy, German and national, not European and papal. To become permanent it must receive the sanction of pope and council, for the Roman emperor could not set up a church of Germany. Yet the formula adopted might conceivably be found to fall within the four corners of the faith, and so obviate the necessity alike of force or council. Such were the conditions of the emperor's task, and such the methods which he actually pursued. He would advance now on one line, now on another, now on two or three concurrently, but he never definitely abandoned any. This fusion of obstinacy and versatility was a marked feature of his character. Suspension was of course often accidental and involuntary. The two chief stages of Lutheran growth naturally corresponded with the periods, each of nine years, when Charles was absent. Deliberate suspension was usually a consequence of the failure of comprehension. Thus at Augsburg in 1530 the wide gulf between the Lutheran confession and the Catholic confutation led to the definite suspensive treaty granted to the Lutherans at Nuremberg (1532). Charles dared not employ the alternative of force, because he needed their aid for the Turkish war. In 1541, after a series of religious conferences, he personally presented a compromise in the so-called Book of Regensburg, which was rejected by both parties. He then proposed that the articles agreed upon should be compulsory, while on others toleration should be exercised until a national council should decide. Never before nor after did lie so far upon the path of toleration, or so nearly accept a national settlement. He was then burning to set sail for Algiers. His last formal suspensive measure was that of Spangenberg in 1555. It was marching against the crisis. He promised a free and general council to be held in Germany, and, as a preparation, a national religious congress. The Lutherans were privately assured that a measure of comprehension should be concluded with or without papal approval. Meanwhile all edicts against heresy were suspended. No wonder that Charles afterwards confessed that he could scarcely reconcile these concessions with his conscience, but he won Lutheraid for his campaign. The peace of Crépy gave all the conditions required for the employment of force. He had peace with French and Turk, he won the active support of the pope, he had deeply divided the Lutherans and reconciled Bavaria. Finding that the Lutherans would not accept the council summoned by the pope to Trent, he resorted to force, and force succeeded. At the Armed Diet of 1548 reunion seemed within reach. But Paul III. in direct opposition to Charles's wish had withdrawn the council from Trent to Bologna. Charles could not force Lutherans to submit to a council which he did not himself recognize, and he could not
bring himself to national schism. Thus, falling back upon his old palliatives, he issued the Interim and the accompanying Reform of the Clergy, pending a final settlement by a satisfactory general council. These measures pleased neither party, and Charles at the very height of his power had failed. He was conscious of failure, and made few attempts even to enforce the Interim. Henceforward political complications gathered round him anew. The only remedy was toleration in some form, independent of the papacy and limitless in time. To this Charles could never assent. His ideal was shattered, but it was a great ideal, and the patience, the moderation, even at times the adroitness with which he had striven towards it, proved him to be no bigot.

The idea of abdication had long been present with Charles. After his failure to eject the French from Metz he had not shrunk from a wearisome campaign against Henry II, and he was now tired out. His mother's death removed an obstacle, for there could now be no question as to his son's succession to the Spanish kingdoms. Religious settlement in Germany could no longer be postponed, and he shrank from the responsibility; the hand that should rend the seamless raiment of God's church must not be his. He assumed the solemn authority emperor, although at his brother's earnest request formal abdication was delayed until 1558. In the Hall of the Golden Fleece at Brussels on the 25th of October 1555 he formally resigned to Philip the sovereignty of his beloved Netherlands. Turning from his son to the representatives of the estates he said, "Gentlemen, you must not be astonished if, old and feeble as I am in all my members, and also from the love I bear you, I shed some tears." In the Netherlands at least the love was reciprocal, and tears were infectious among the thousand deputies who listened to their sovereign's last speech. On the 16th of January 1556, Charles resigned his Spanish kingdoms and that of Sicily, and shortly afterwards his county of Burgundy. On the 17th of September he sailed from Flushing on the last of his many voyages, an English fleet from Portland bearing him company down the Channel. In February 1557 he was installed in the home which he had chosen at Yuste in Estremadura.

The excellent books which have been written upon the emperor's retirement have inspired an interest out of all proportion to its real significance. His little house was attached to the monastery, but was not within it. He was neither an ascetic nor a recluse. Gastronomic indiscretions still entailed their inevitable penalties. Society was not confined to intercourse of civilities with the brethren. His relations, his chief friends, his official historians, all found their way to Yuste. Couriers brought news of Philip's war and peace with Pope Paul IV., of the victories of Saint Quentin and Gravelines, of the French capture of Calais, of the danger of Oran. As head of the family he intervened in the delicate relations with the closely allied house of Portugal: he even negotiated with the house of Navarre for reparation for the wrong done by his grandfather Ferdinand, which appeared to weigh upon his conscience. Above all he was shocked by the discovery that Spain, his own court, and his very chapel were infected with heresy. His violent letters to his son and daughter recommending immediate persecution, his profession of regret at having kept his word when Luther was in his power, have weighed too heavily on his reputation. The feverish phrasing of this excommunication due to broken health and unnatural retirement cannot balance the deliberate humanity and honour of wholesome manhood. Apart from such occasional moments of excitement, the emperor's last years passed tranquilly enough. At first he would shoot pigeons in the monastery woods, and till his last illness tended his garden and his animal pets, or watched the operations of Torrioni, maker of clocks and mechanical toys. After an illness of three weeks the call came in the early hours of the feast of St Matthew, who, as his chaplain said, had for Christ's sake forsaken wealth even as Charles had forsaken empire. The dying man clasped his wife's crucifix to his breast till his fingers lost their hold. The archbishop held it before his eyes, and with the cry of "Ay Jesus!" died, in the words of his faithful squire D. Luis de Quijada, "the chief of men that had ever been or would ever be." Posternity need not agree, but no great man can boast a more honest panegyric.

In character Charles stands high among contemporary princes. It consists of pairs of contrasts, but the better side is usually stronger than the worse. Steadfast honesty of purpose was occasionally warred by self-interest, or rather he was apt to think that his own course must needs be that of righteousness. Self-control would give way, but very rarely, to squabbles of passion. Obstinacy and irresolution were fairly balanced, the former generally bearing upon ends, the latter upon means. His own ideals were constant, but he could gradually assimilate the views of others, and could bend to argument and circumstance; yet even here he had a habit of harking back to earlier schemes which he had seemed to have definitely abandoned. Intercourse with different nationalities taught him a certain versatility; he was dignified with Spaniards, familiar with Flemings, while the material Italians were pleased with his good sense. His sympathies were neither wide nor quick, but he was a most faithful friend, and the most considerate of masters. For all who sought him his courtesy and patience were unflagging. At his abdication he dwelt with reasonable pride upon his labours and his journeyings. As a son he must have lived a more strenuous life. Yet his industrialism was broken by fits of indolence, which were probably due to health. In his prime his confessed warred him against this defect, and it caused, indeed, the last great disaster of his life. Fortunately he was conscious of his obstinacy, his irresolution and his indolence. He would accept admonition from the chapter of the Golden Fleece, would comment on his failings as a warning to his son. When Cardinal Contarini politely assured him that to hold fast to good opinions is not obstinacy but firmness, the emperor replied, "Ah! but I sometimes stick to bad ones." Charles was not cruel, indeed the character of his reign was peculiarly merciful. But he was somewhat unforgiving. He especially resented any slight upon his honour, and his unwise severity to Philip of Hesse was probably due to the unfounded accusation that he had imprisoned him in violation of his pledge. The excesses of his troops in Italy, in Guelders and on the Austrian frontiers caused him acute pain, although he called himself "hard to weep." No great nobleman, statesman or financier was executed at Charles's order. He was proud of his generalship, clasping himself with Alva and Mancinorum at the best of his day. Yet his failures nearly balanced his successes. It is true that in his most important campaign, that against the League of Schmalkalden, the main credit must be ascribed to his well-judged audacity at the opening, and his dogged persistency at the close. As a soldier he must rank very high. It was said that his being emperor lost to Spain the best light horseman of his army. At every crisis he was admirably cool, setting a truly royal example to his men. His mettle was displayed when he was attacked on the burning sands of Tunis, when his troops were driven in panic from Algiers, when in spite of physical suffering he forded the Elbe at Mühlberg, and when he was bombarded by the vastly superior Lutheran artillery under the walls of Ingolstadt. When blamed for exposing himself on this last occasion, "I could not help it," he apologized; "we were short of hands, I could not set a bad example." Nevertheless he was by nature timid. Just before this very action he had a turn of trembling, and he was afraid of mice and spiders. The force of his example was not confined to the court. Many writers wrote from Augsburg in 1530 that he was a model of continence, temperance and moderation, that the old domestic discipline was now only preserved in the imperial household. He tenderly loved his wife, whom he had married for pecuniary and diplomatic reasons. Of his two well-known illegitimate children, Margaret was born before he married, and Don John long after his wife's death, but he felt this latter to be a child of shame. His sobriety was frequently contrasted with the universal drunkenness of the German and Flemish nobles, which he earnestly condemned. But on his appetite he could place no control, in spite of the ruinous effects of his gluttony upon his health. In dress, in his household, and in his stable he was simple and economical. He loved children, flowers, animals and birds. Professional
jesters amused him, and he was not above a joke himself. Maps and mechanical inventions greatly interested him, and in later life he became fond of reading. He takes his place indeed among authors, for he dictated the commentaries on his own career. Of music he possessed a really fine knowledge, and his high appreciation of Titian proves the purity of his feeling for art. The little collection of books and pictures which he carried to Yuste is an index of his tastes. Charles was undeniably plain. He confessed that he was by nature ugly, but that as artists usually painted him uglier than he was, strangers on seeing him were agreeably disappointed. The protruding lower jaw and the thin pale face were redeemed by the fine open brow and the bright speaking eyes. He was, moreover, well made, and in youth had an incomparable leg. Above all no man could doubt his dignity; Charles was every inch an emperor.

CHARLES VI. (1668-1740). Roman emperor, was born on the 1st of October 1668 at Vienna. He was the second son of the emperor Leopold I. by his third marriage with Eleonora, daughter of Philip William of Neuburg, elector palatine of the Rhine. When the Spanish branch of the house of Habsburg became extinct in 1700, he was put forward as the lawful heir in opposition to Philip V., the Bourbon to whom the Spanish dominions had been left by the will of Charles II. of Spain. He was proclaimed Charles V. at Yuste may be studied in L. P. Gachard’s Retracts et mort de Charles-guinet au monastère de Yuste (Brussels, 1854-1855), and in Sir W. Stirling-Maxwell’s The Cloister Life of the Emperor Charles V. (London, 4 editions from 1852); also in W. H. Prescott’s edition of Robertson’s History (1857).

Chief followed him to Vienna, and their advice had an unfortunate influence on his mind. They almost succeeded in arousing his suspicions of the loyalty of Prince Eugene at a very moment when the prince’s splendid victories over the Turks had led to the peace of Passarowitz on the 28th of July 1718, and a great extension of the Austrian dominions eastward. Charles showed an enlightened, though not always successful, interest in the commercial prosperity of his subjects, but from the date of his return to Germany till his death his ruling passion was to secure his inheritance against dismemberment. As early as 1713 he had begun to prepare the “Pragmatic Sanction” which was to regulate the succession. An only son, born on the 13th of April 1716, died in infancy, and it became the object of his policy to obtain the recognition of his daughter Maria Theresa as his heiress. He made great concessions to obtain his aim, and embarked on complicated diplomatic negotiations. His last days were embittered by a disastrous war with Turkey, in which he lost almost all he had gained by the peace of Passarowitz. He died at Vienna on the 20th of October 1740, and with him expired the male line of his house. Charles VI was an admirable representative of the tenacious ambition of the Habsburgs, and of their belief in their own “august greatness” and boundless rights.

For the personal character of Charles VI, see A. von Arnet, Geschichte Karls V. (Vienna, 1865-1879); Dr Franz Krones, R. v. Marchland, Grundriss der österreichischen Geschichte (Vienna, 1882), gives a very copious bibliography.

CHARLES VII. (1697-1745). Roman emperor, known also as Charles Albert, elector of Bavaria, was the son of the elector Maximillian Emanuel and his second wife, Theresa Cuniguanda, daughter of John Sobieski, king of Poland. He was born on the 6th of August 1697. His father having taken the side of Louis XIV. of France in the War of the Spanish Succession (1701), Bavaria was occupied by the allies. Charles and his brother Clement, afterwards archbishop of Cologne, were carried prisoners to Vienna, and were educated by the Jesuits under the name of the counts of Wittelsbach. When his father was restored to his electorate, Charles was released, and in 1717 he led the Bavarian contingent of the imperial army which served under Prince Eugene against the Turks, and is said to have distinguished himself thereby. On the 25th of September 1722 he was betrothed to Maria Anna, second daughter of the two orphan daughters of the emperor Joseph I. Her uncle Charles VI insisted that the Bavarian house should recognize the Pragmatic Sanction which established his daughter Maria Theresa as heiress of the Habsburg dominions. They did so, but with secret protests and mental reservations of their rights, which were designed to render the recognition valueless. The electors of Bavaria had claims on the possessions of the Habsburgs under the will of the emperor Ferdinand I., who died in 1756.

Charles succeeded his father on the 26th of February 1726. As a ruler of Bavaria, he showed a vague disposition to improve the condition of his subjects, but his profuse habits and his efforts to rival the splendour of the French court crippled his finances. His policy was one of much duplicity, for he was constantly endeavouring to keep on good terms with the emperor while slipping out of his obligation to accept the Pragmatic Sanction and intriguing to secure French support for his claims whenever Charles VI should die. On hearing of the emperor’s last illness, he ordered his agent at Vienna to renew his claim to the Austrian inheritance. The claim was at last renewed immediately after the death of Charles VI on the 20th of October 1740. Charles Albert now entered into the league against Maria Theresa, to the great misfortune of himself and his subjects. By the help of her enemies he was elected emperor in opposition to her husband Francis, grand duke of Tuscany, on the 24th of January 1742, under the title of Charles VII., and was crowned at Frankfort-on-Main on the 12th of February. But as his army had been neglected, he was utterly unable to resist the Austrian troops. While he was being crowned his hereditary dominions in Bavaria were being overrun. He described himself as attacked by stone and gout, ill, without money or land, and in distress comparable to the
sorrows of Job. During the War of the Austrian Succession (1740-1748) he was a mere puppet in the hands of the anti-Austrian coalition, and was often in want of mere necessaries. In the changes of the war he was able to re-enter his capital, Munich, in 1743, but had immediately afterwards to take flight again. He was restored by Frederick the Great in October 1744, but died worn out at Munich on the 20th of January 1745.

See A. von Arnoth, Geschichte Maria Theresias (Vienna, 1863-1879); and P. T. Heigel, Der österreichische Erschopfungskrieg und die Kaiseressin Karls VII. (Munich, 1877).

CHARLES I. (1600-1649), king of Great Britain and Ireland, second son of James I. and Anne of Denmark, was born at Dunfermline on the 19th of November 1600. At his baptism he was created duke of Albany, and on the 16th of January 1605 duke of York. In 1612, by the death of his elder brother Henry, he became heir-apparent, and was created prince of Wales on the 3rd of November 1616. In 1620 he took up warmly the cause of his sister the queen of Bohemia, and in 1621 he defended Bacon, using his influence to prevent the chancellor's degradation from the peerage. The prince's marriage with the infanta Maria, daughter of Philip III. of Spain, had been for some time the subject of negotiation, James desiring to obtain through Spanish support the restitution of his son-in-law, Frederick, to the Palatinate; and in 1623 Charles was persuaded by Buckingham, who now obtained a complete ascendancy over him in opposition to wiser advisers and the king's own wishes, to make a secret expedition himself to Spain, put an end to all formalities, and bring home his mistress himself; "a gallant and brave thing for his Highness." "Steenie" and "Baby Charles," as James called them, started on the 17th of February, arriving at Paris on the 21st and at Madrid on the 7th of March, where they assumed the unromantic names of Mr Smith, and Mr Brown. They found the Spanish court by no means enthusiastic for the marriage1 and the princess herself averse. The prince's immediate conversion was expected, and a complete religious toleration granted to the Roman Catholics in England demanded. James engaged to allow the infanta the right of public worship and to use his influence to modify the law, but Charles himself went much further. He promised the alteration of the penal laws within three years, conceded the education of the children to the mother till the age of twelve, and undertook to listen to the infanta's priests in matters of religion, signing the marriage contract on the 25th of July 1623. The Spanish, however, did not trust to words, and Charles was informed that his wife could only follow him to England when these promises were executed. Moreover, they had no intention whatever of aiding the Protestant Frederick. Meanwhile Buckingham, incensed at the failure of the expedition, had quarrelled with the grandees, and Charles left Madrid, landing at Portsmouth on the 5th of October, to the joy of the people, to whom the proposed alliance was odious. He now with Buckingham urged James to make war on Spain, and in December 1624 signed a marriage treaty with Henrietta Maria, daughter of Henry IV. of France. In April Charles had declared solemnly to the parliament that in case of his marriage to a Roman Catholic princess no concessions should be granted to recusants, but these were in September 1624 deliberately promised by James and Charles in a secret article, the first instance of the duplicity and deception practised by Charles in dealing with the parliament and the nation. The French on their side promised to assist in Mansfield's expedition for the recovery of the Palatinate, but Louis in October refused to allow the men to pass through France; and the army, without pay or provisions, dwindled away in Holland to nothing.

On the 27th of March 1625 Charles I. succeeded to the throne by the death of his father, and on the 5th of May he was married by proxy to Henrietta Maria. He received her at Canterbury on the 13th of June, and on the 18th his first parliament assembled. On the day of his marriage Charles had given directions that the prosecutions of the Roman Catholics should cease, but he now declared his intention of enforcing the laws against them, and demanded subsidies for carrying on the war against Spain. The Commons, however, responded boldly. Charles had sent ships to Louis XIII. to be used against the Protestants at La Rochelle, and the Commons were not aware of the subterfuges and fictitious delays intended to prevent their employment. The Protestant feelings of the Commons were also aroused by the king's support of the royal chaplain, Richard Montagu, who had repudiated Calvinistic doctrine. They only voted small sums, and sent up a petition on the state of religion and reflecting upon Buckingham, whom they deemed responsible for the failure of Mansfield's expedition, at the same time demanding counsellors in whom they could trust. Parliament was accordingly dissolved by Charles on the 12th of August. He hoped that greater success abroad would persuade the Commons to be more generous. On the 8th of September 1625 he made the treaty of Southampton with the Dutch against Spain, and sent an expedition to Cadiz under Sir Edward Cecil, which, however, was a failure. In order to make himself independent of parliament he attempted to raise money on the crown jewels in Holland, and to diminish the opposition in the Commons he excluded the chief leaders by appointing them sheriffs. When the second parliament met, however, on the 5th of February 1626, the opposition, led by Sir John Eliot, was more determinate than ever, and the attack was concentrated upon Buckingham. On the 29th of March, Charles, calling the Commons into his presence, accused them of leading him into the war and of taking advantage of his difficulties to "make their own game." "I pray you not to be deceived," he said, "it is not a parliamentary way, nor 'tis not a way to deal with a king. Remember that parliaments are altogether in my power for their calling, sitting, and dissolution; therefore as I find the fruits of them good or evil, they are to continue or not to be." Charles, however, was worsted in several collisions with the two houses, with a consequent loss of influence. He was obliged by the peers to set at liberty Thomas Howard, earl of Arundel, whom he had put into the Tower, and to send a summons to the earl of Bristol, whom he had attempted to exclude from parliament, while the Commons compelled him, with a threat of doing no business, to liberate Eliot and Digges, the managers of Buckingham's impeachment, whom he had imprisoned. Finally in June the Commons answered Charles's demand for money by a remonstrance asking for Buckingham's dismissal, which they decided must precede the grant of supply. They claimed responsible ministers, while Charles considered himself the executive and the sole and unfettered judge of the necessities of the state. Accordingly on the 15th Charles dissolved the parliament.

The king was now in great need of money. He was at war with Spain and had promised to pay £30,000 a month to Christian IV. of Denmark in support of the Protestant campaign in Germany. To these necessities was now added a war with France. Charles had never kept his promise concerning the recusants; disputes arose in consequence with his wife, and on the 31st of July 1626 he ordered all her French attendants to be expelled from Whitehall and sent back to France. At the same time several French ships carrying contraband goods to the Spanish Netherlands were seized by English warships. On the 27th of June 1627 Buckingham with a large expedition sailed to the Isle of Ré to relieve La Rochelle, then besieged by the forces of Louis XIII. Though the success of the French Protestants was an object much desired in England, Buckingham's unpopularity prevented support being given to the expedition, and the duke returned to Plymouth on the 11th of November completely defeated. Meanwhile Charles had endeavoured to get the money refused to him by parliament by means of a forced loan, dismissing Chief Justice Crewe for declining to support its legality, and imprisoning several of the leaders of the opposition for refusing to subscribe to it. These summary measures, however, only brought a small sum into the treasury. On the 2nd of January 1628 Charles ordered the release of all the persons imprisoned, and on the 17th of March summoned his third parliament.

Instead of relieving the king's necessities the Commons immediately proceeded to discuss the constitutional position and to formulate the Petition of Right, forbidding taxation without

---

consent of parliament, arbitrary and illegal imprisonment, compulsory billeting in private houses, and martial law. Charles, on the 1st of May, first demanded that they should “rest on his royal word and promise.” He obtained an opinion from the judges that the acceptance of the petition would not absolutely preclude in certain cases imprisonments without showing cause, and after a futile endeavour to avoid an acceptance by returning an ambiguous answer which only exasperated the Commons, he gave his consent on the 7th of June in the full and usual form. Charles now obtained his subsidies, but no real settlement was reached, and his relations with the parliament remained as unfriendly as before. They proceeded to remonstrate against his government and against his support of Buckingham, and denied his right to tonnage and poundage. Accordingly, on the 26th of June they were prorogued. New disasters befell Charles, in the assassination of Buckingham and in the failure of the fresh expedition sent to Ré. In January 1639 the parliament re-assembled, irritated by the exaction of the duties and seizure of goods during the interval, and suspicious of “innovations in religion,” the king having forbidden the clergy to continue the controversy concerning Calvinistic and Arminian doctrines, the latter of which the parliament desired to suppress. While they were discussing these matters, on the 2nd of March 1639, the king ordered them to adjourn, but amidst a scene of great excitement the speaker, Sir John Finch, was held down in his chair and the doors were locked, whilst resolutions against innovations in religion and declaring those who vowed or paid tonnage and poundage enemies to their country were passed. Parliament was immediately dissolved, and Charles imprisoned nine members, leaders of the opposition, Eliot, Holles, Strode, Selden, Valentine, Coryton, Heyman, Hobart and Long, his vengeance being especially shown in the case of Eliot, the most formidable of his opponents, who died in the Tower of consumption after long years of close and unhealthful confinement, and whose corpse even Charles was afraid to have exhibited to his people.

For eleven years Charles ruled without parliaments and with some success. There seemed no reason to think that “that noise,” to use Laud’s expression concerning parliaments, would ever be heard again by those then living. A revenue of about £63,000 was obtained by enforcing the payment of tonnage and poundage, and while avoiding the taxes, loans, and benevolences forbidden by the petition of right, by monopolies, fines for knighthood, and for pretended encroachments on the royal domains and forests, which enabled the king to meet expenditure at home. In Ireland, Charles, in order to get money, had granted the Graces in 1628, conceding security of titles of more than sixty years’ standing, and a more moderate oath of allegiance for the Roman Catholics, together with the renunciation of the shilling fine for non-attendance at church. He continued, however, to make various attempts to get estates into his possession on the pretext of invalid title, and on the 12th of May 1634 the city of London demanded the return of two Chancery cases, which was delayed until the most valuable settlements in Ireland founded by James I. In the interests of national defence, and at the same time extinguished the historic loyalty of the city of London, which henceforth steadily favoured the parliamentary cause. In 1633 Wentworth had been sent to Ireland to establish a medieval monarchy and get money, and his success in organization seemed great enough to justify the attempt to extend the system to England. Charles at the same time restricted his foreign policy to scarcely more than a wish for the recovery of the Palatinate, to further which he engaged in a series of numerous and mutually destructive negotiations with Gustavus Adolphus and with Spain, finally making peace with Spain on the 5th of November 1630, an agreement which was followed on the 2nd of January 1631 by a further secret treaty, the two kings binding themselves to make war on the Dutch and partition their territories. A notable feature of this agreement was that while in Charles’s position Roman Catholicism was to be tolerated, there was no guarantee for the security of Protestantism in the territory to be ceded to Spain.

In 1634 Charles levied ship-money from the seaport towns for the increase of the navy, and in 1635 the tax was extended to the inland counties, which aroused considerable opposition. In February 1637 Charles obtained an opinion in favour of his claims from the judges, and in 1638 the great Hampden case was decided in his favour. The apparent success, however, of Charles was imperilled by the general and growing resentment aroused by his exactions and whole policy, and this again was small compared with the fears excited by the king’s attitude towards religion and Protestantism. He supported zealously Laud’s rigid orthodox, his compulsory introduction of unorthodox ritual, and his narrow, intolerant and despotic policy, which was marked by several savage prosecutions and sentences in the Star Chamber, drove numbers of moderate Protestants out of the Church into Presbyterianism, and created an intense feeling of hostility to the government throughout the country. Charles further increased the popular fears on the subject of religion by his welcome given to Panzani, the pope’s agent, in 1634, who endeavoured unsuccessfully to reconcile the two churches, and afterwards to George Comyn, papal agent at the court of Henrietta Maria, while the favour shown by the king to these was contrasted with the severe sentences passed upon the Puritans.

The same imprudent neglect of the national sentiment was pursued in Scotland. Charles had already made powerful enemies there by a declaration announcing the arbitrary revocation of former church estates to the crown. On the 18th of June 1633 he was crowned at Edinburgh with full Anglican ceremonial, which lost him the hearts of numbers of his Scottish subjects and aroused hostility to his government in parliament. After his return to England he gave further offence by ordering the use of the surplice, by his appointment of Archbishop Spvitwood as chancellor of Scotland, and by introducing other bishops into the privy council. In 1636 the new Book of Canons was issued by the king’s authority, ordering the communion table to be placed at the east end, enjoining confession, and declaring excommunicate any who should presume to attack the new prayer-book. The latter was ordered to be used on the 18th of October 1636, but it did not arrive in Scotland till May 1637. It was intensely disliked both as “popish” and as English. A riot followed its first use in St Giles’ cathedral on the 23rd of July, and Charles’s order to enforce it on the 10th of September was met by fresh disturbances and by the establishment of the “Tables,” national committees which now became the real though informal government of Scotland. In 1638 the national covenant was drawn up, binding those that signed it to defend their religion to the death, and was taken by large numbers with enthusiasm all over the country. Charles now drew back, promised to enforce the canons and prayer-book only in a “fair and legal way,” and sent the marquis of Hamilton as a mediator. The latter, however, a weak and incapable man, desirous of popularity with all parties, and unfaithful to the king’s interests, yielded everything, without obtaining the return of Charles’s subjects to their allegiance. The assembly met at Glasgow on the 21st of November, and in spite of Hamilton’s opposition immediately proceeded to judge the bishops. On the 8th Hamilton dissolved it, but it continued to sit, deposed the bishops and re-established Presbyterianism. The rebellion had now begun, and an appeal to arms alone could decide the quarrel between Charles and his subjects. On the 28th of May 1639 he arrived at Berwick with a small and ill-trained force, thus beginning what is known as the first Bishops’ War; but being confronted by the Scottish army at Duns Law, he was compelled to sign the treaty of Berwick on the 18th of June, which provided for the disarmament of both armies and the restitution to the king of the royal castles, referring all questions to a general assembly and a parliament. When the assembly met it abolished episcopacy, but Charles, who on the 3rd of August had returned to Whitehall, refused his consent to this and to other measures proposed by the Scottish parliament. His extreme financial necessities, and the prospect of renewed hostilities with the Scots, now moved Charles, at the instigation of Strafford, who in September had left Ireland to become the king’s chief adviser, to turn again to parliament for assistance as the last resource,
and on the 13th of April 1640 the Short Parliament assembled. But on its discussing grievances before granting supplies and finally refusing subsidies till peace was made with the Scots, it was dissolved on the 4th of May. Charles returned once more to measures of repression, and on the 10th imprisoned some of the London aldermen who refused to lend money. He prepared for war, scraping together what money he could and obtaining a grant through Strafford from Ireland. His position, however, was hopeless; his forces were totally undisciplined, and the Scots were supported by the parliamentary opposition in England.

On the 20th of August the Scots crossed the Tweed, beginning the so-called second Bishops' War, defeated the king's army at Newburn on the 28th, and subsequently occupied Newcastle and Durham. Charles at this juncture, on the 24th of September, summoned a great council of the peers; and on the 21st of October a cessation of arms was agreed to by the treaty of Ripon, the Scots receiving £850 a day for the maintenance of the army, and further negotiations being transferred to London. On the 3rd of November the king summoned the Long Parliament.

Such was the final issue of Charles's attempt to govern without parliaments—Scotland in triumphant rebellion, Ireland only waiting for a signal to rise, and in England the parliament revived with almost irresistible strength, in spite of the king, by the force of circumstances alone. At this great crisis, which would indeed have taxed the resource and energy of the most cool-headed and sagacious statesman, Charles failed signally. Two alternative courses were open to him, either of which still offered good chances of success. He might have taken his stand on the ancient and undoubted prerogative of the crown, resisted all encroachments on the executive by the parliament by legal and constitutional means, which were probably ample, and in case of necessity have appealed to the loyalty of the nation to support him in arms; or he might have waived his rights, and, acknowledging the mistakes of his past administration, have united with the parliament and created once more that union of interests and sentiment of the monarchy with the nation which had made England so powerful. Charles, however, pretended to do both simultaneously or by turns, and therefore accomplished neither. The illegally imprisoned members of the last parliament, now smarting with the sense of their wrongs, were set free to stimulate the violence of the opposition to the king in the new assembly. Of Charles's double statecraft, however, the series of incidents which terminated the career of the great Strafford form the most terrible example. Strafford had come to London in November, having been assured by Charles that he "should not suffer in his person, honour or fortune," but was impeached and thrown into the Tower almost immediately. Charles took no steps to hinder the progress of the proceedings against him, but entered into schemes for saving him by bringing up an army to London, and this step exasperated Strafford's enemies and added new zeal to the prosecution. On the 23rd of April, after the passing of the attainder by the Commons, he repeated to Strafford his former assurances of protection. On the 1st of May he appealed to the Lords to spare his life and be satisfied with rendering him incapable of holding office. On the 2nd he made an attempt to surround the Tower; but Strafford with great coolness consoled the queen's fears and to the mob surging round his palace, he signed his death-warrant. "If my own person only were in danger," he declared to the council, "I would gladly venture it to save my Lord Strafford's life; but seeing my wife, children, all my kingdom are concerned in it, I am forced to give way unto it." On the 11th he sent to the peers a petition for Strafford's life, the force of which was completely annulled by the strange postscript: "If he must die, it were a charity to reprieve him until Saturday." This tragic surrender of his great and devoted servant left an indelible stain upon the king's character, and he lived to repent it bitterly. One of his last admonitions to the prince of Wales was "never to give way to the punishment of any of their faithful service to the crown." It was regarded by Charles as the cause of his own subsequent misfortunes, and on the scaffold the remembrance of it disturbed his own last moments. The surrender of Strafford was followed by another stupendous concession by Charles, the surrender of his right to dissolve the parliament without its own consent, and the parliament immediately proceeded, with Charles's consent, to sweep away the star-chamber, high commission and other extra-legal courts, and all extra-parliamentary taxation. Charles, however, did not remain long or consistently in the yielding mood. In June 1641 he engaged in a second army plot for bringing up the forces to London, and on the 10th of August he set out for Scotland in order to obtain the Scottish army against the parliament in England; this plan was obviously doomed to failure and was interrupted by another appeal to force, the so-called Incident, at which Charles was suspected (in all probability unjustly) of having connived, consisting in an attempt to kidnap and murder Argyll, Hamilton and Lanark, with whom he was negotiating. Charles had also apparently been intriguing with Irish Roman Catholic lords for military help in return for concessions, and he was suspected of complicity in the Irish rebellion which now broke out. He left Scotland more discredited than ever, having by his concessions made, to use Hyde's words, "a perfect deed of gift of that kingdom," and without obtaining any advantage.

Charles returned to London on the 25th of November 1641 and was immediately confronted by the Grand Remonstrance (passed on the 22nd) in which, after reciting the chief points of the king's misgovernment, the parliament demanded the appointment of acceptable ministers and the constitution of an assembly of divines to settle the religious question. On the 2nd of January 1642 Charles gave office to the opposition members Colepeper and Falkland, and at the same time Hyde left the opposition party to serve the king. Charles promised to take no serious step without their advice. Nevertheless, entirely without their knowledge, through the influence of the queen whose impeachment was intended, Charles on the 4th made the rash and fatal attempt to seize with an armed force the five members of the Commons, Pym, Hampden, Holles, Heslierge and Strode, whom, together with Mandeville (afterwards earl of Manchester) in the Lords, he had impeached of high treason. No English sovereign ever had (or has since that time) penetrated into the House of Commons. So complete and flagrant a violation of parliamentary liberties, and an appeal so crude and glaring to brute force, could only be justified by complete success; but the court plans had been betrayed, and were known to the offending members, who, by order of the House, had taken refuge in the city before the king's arrival with the soldiers. Charles, on entering the House, found "the birds flown," and returned baffled, having thrown away the last chance of a peaceful settlement (see Lenthall, William). The next day Charles was equally unsuccessful in obtaining their surrender in the city. "The king had the worst day in London yesterday," wrote a spectator of the scene, "that ever he had, the people crying 'privilege of parliament' by thousands and prayed God to turn the heart of the king, shutting up their shops and standing at their doors with swords and halberds." On the 10th, amidst general manifestations of hostility, Charles left Whitehall to prepare for war, destined never to return till he was brought back by his victorious enemies to die. On the 13th, after obtaining the control of the forces and in a paper war of controversy, on the 23rd of April Charles was refused entry into Hull, and on the 2nd of June the parliament sent to him the "Nineteen Propositions," claiming the whole sovereignty and government for the parliament, including the choice of the ministers, the judges, and the control of the army, and the execution of the laws against the Roman Catholics. The military events of the war are described in the article GREAT REBELLION. On the 22nd of August the king set up his standard at Nottingham, and on the 23rd of October he fought the indecisive battle of Edgehill, occupying Oxford and advancing as far as Brentford. It seemed possible that the war might immediately be ended by Charles penetrating to the heart of the enemy's position and occupying London, but he drew back on the 13th of November before the parliamentary force at Turnham Green, and avoided a decisive contest.

1Hist. MSS. Comm.: M.S. of Lord Montagu of Beaulieu, 141.
The campaign of 1644 began far less favourably for Charles than the two last, principally owing to the alliance now made between the Scots and the parliament, the parliament taking the Solemn League and Covenant on the 25th of September 1643, and the Scottish army crossing the border on the 19th of January 1644. No attempt was this year made against London, and Rupert was sent to Newcastle's succour in the north, where the great disaster of Marston Moor on the 2nd of July ruined Charles's last chances in that quarter. Meanwhile Charles himself had defeated Waller at Cropredy Bridge on the 26th of June, and he subsequently followed Essex to the west, compelling the surrender of Essex's infantry at Lostwithiel on the 2nd of September. With an ill-tempered leniency he allowed the men to go free after giving up their stores and arms, and on his return towards Oxford he was confronted again by Essex's army at Newbury, combined now with that of Waller and of Manchester. Charles owed his escape here from complete annihilation only to Manchester's unwillfulness to inflict a total defeat, and he was allowed to get away with his artillery to Oxford and to revisit Donnington Castle and Basing House.

The negotiations carried on at Uxbridge during January and February 1645 failed to secure a settlement, and on the 14th of June the crushing defeat of the king's forces by the new model army at Naseby practically ended the civil war. Charles, however, refused to make peace on Rupert's advice, and considered it a point of honour "neither to abandon God's cause, injure my successors, nor forsake my friends." His chief hope was to join Montrose in Scotland, but his march north was prevented by the parliamentary forces, and on the 24th of September he witnessed from Naseby field the defeat of the militia at the Battle of Marston Moor. He now entered into a series of intrigues, mutually destructive, which, becoming known to the different parties, exasperated all and diminished still further the king's credit. One proposal was the levy of a foreign force to reduce the kingdom; another, the supply through the marquis of Ormonde of 10,000 Irish. Correspondence relating to these schemes, fatally compromising as they were if Charles hoped ever to rule England again, was discovered by his enemies, including the Clagmoran treaty, which went much further than the instructions to Ormonde, but of which the full responsibility has never been really traced to Charles, who on the 29th of January 1646 disavowed his agent's proceedings. He simultaneously treated with the parliament, and promised toleration to the Roman Catholics if they and the pope would aid in the restoration of the monarchy and the church. Nor was this all. The parliamentary forces had been closing round Oxford. On the 27th of April the king left the city, and on the 5th of May gave himself up to the Scottish army at Newark, arriving on the 14th with them at Newcastle.

On the 13th of July the parliament sent to Charles the "Newcastle Propositions," which included the extreme demands of Charles's acceptance of the Covenants, the abolition of episcopacy and establishment of Presbyterianism, severer laws against the Roman Catholics and parliamentary control of the forces, with the withdrawal of the Irish Cessation, and a long list of royalists to be exempted from pardon. Charles returned no definite answer for several months. He imagined that he might now find support in Scottish royalism, encouraged by Montrose's series of brilliant victories, but these hopes were destroyed by the latter's defeat at Philiphaugh on the 3rd of September. The Scots insisted on the Covenant and on the permanent establishment of Presbyterianism, while Charles would only consent to a temporary maintenance for three years. Accordingly the Scots, in return for the payment of part of their army arrears by the parliament, marched home on the 30th of January 1647, leaving Charles behind, who under the care of the parliamentary commissioners was conducted to Holmby House. Thence on the 12th of May he sent his answer to the Newcastle Propositions, offering the militia to the parliament on condition of the establishment of Presbyterianism, for three, while a final settlement on religion was to be reached through an assembly of twenty divines at Westminster. But in the midst of the negotiation with the parliament Charles's person was seized, on the 3rd of June 1647, by Cornet Joyce under instructions of the army, which soon afterwards occupied London and overpowered the parliament, placing Charles at Hampton Court.

If Charles could have remained firm to either one or the other faction, and have made concessions either to Presbyterianism or on the subject of the militia, he might even now have prevailed. But he had learned nothing by experience, and continued at this juncture his characteristic policy of intrigue and double-dealing, "playing his game," to use his own words, negotiating with both parties at once, not with the object or wish to arrive at a settlement with either, but to augment their disputes, gain time and profit ultimately by their divisions. The "Heads of the Proposals," submitted to Charles by the army on the 28th of July 1645, were terms conceived on a basis far broader and more statesmanlike than the Newcastle Propositions, and such as Charles might well have accepted. The proposals on religion anticipated the Toleration Act of 1689. There was no mention of episcopacy, and its existence was thereby indirectly admitted, but complete religious freedom for all Protestant denominations was provided, and the power of the church to inflict civil penalties abolished, while it was also suggested that dangers from Roman Catholics and Jesuits might be avoided by means other than enforcing attendance at church. The parliament was to dissolve itself and be succeeded by biennial assemblies elected on a reformed franchise, not to be dissolved without their own consent before 120 days, and not to sit more than 240 days in the two years. A council of state was to conduct the foreign policy of the state and conclude peace and war subject to the approval of parliament, and to control the militia for ten years, the commanders being appointed by parliament, as also the officers of the state and revenue. A new parliament was created since May the first, 1642, was to sit in parliament without the consent of the House of Lords, and the judicial decisions of the House of Lords were to be ratified by the Commons. Only five persons were excepted from amnesty, but royalists were not to hold office for five years and not to sit in the Commons till the end of the second biennial parliament. Proposals for a series of reforms were also added. Charles, however, was at the same time negotiating with Lauderdale for an invasion of England by the Scots, and imagined he could win over Cromwell and Fairfax by "profers of advantage to themselves." The precious opportunity was therefore allowed to slip by. On the 9th of September he rejected the proposals of the parliament for the establishment of Presbyterianism. His hopes of gaining advantages by playing upon the differences of his opponents proved a complete failure. Fresh terms were drawn up by the army and parliament together on the 10th of November, but before these could be presented, Charles, on the 11th, had escaped to Carisbrooke Castle in the Isle of Wight.
Thence on the 16th he sent a message offering Presbyterianism for three years and the militia for his lifetime to the parliament, but insisting on the maintenance of episcopacy. On the 28th of December he refused his assent to the Four Bills, which demanded the militia for parliament for twenty years and practically for ever, annulled the honours recently granted by the king and his declarations against the Houses, and gave to parliament the right to adjourn to any place it wished. On the 3rd of January 1648 the Commons agreed to a resolution to address the king no further, in which they were joined by the Lords on the 15th.

Charles had meanwhile taken a further fatal step which brought about his total destruction. On the 26th of December 1647 he had signed at Carisbrooke with the Scottish commissioners the secret treaty called the "Engagement," whereby the Scots undertook to invade England on his behalf and restore him to the throne on condition of the establishment of Presbyterianism for three years and the suppression of the sectarians. In consequence the second civil war broke out and the Scots invaded England under Hamilton. The royalist risings in England were, however, a more decisive victory over the Scots at Preston, Charles himself was now left alone to face his enemies, with the whole tale of his intrigues and deceptions unmasked and exposed. The last intrigue with the Scots was the most unpardonable in the eyes of his contemporaries, no less wicked and monstrous than his design to conquer England by the Irish soldiers; "a more prodigious treason," said Cromwell, "than any that had been perfected before; because the former quarrel was that Englishmen might rule over another; this to vassalize us to a foreign nation." Cromwell, who up to this point had shown himself foremost in supporting the negotiations with the king, now spoke of the treaty of Newport, which he found the parliament in the act of negotiating on his return from Scotland, as "this ruining hypocrifical agreement." Charles had engaged in these negotiations only to gain time and find opportunity to escape. "The great concession I made this day," he wrote on the 7th of October, "was made merely in order to my escape." At the beginning he had stipulated that no concession from him should be valid unless an agreement were reached upon every point. He now consented to most of the demands of the parliament, including the repudiation of the Irish Cessation, the surrender of the delinquents and the cession of the militia for twenty years, and of the offices of state to parliament, but remained firm in his refusal to abolish episcopacy, consenting only to Presbyterianism for three years. Charles's devotion to the church is undoubtedly. In April 1646, before his flight from Oxford, inspired perhaps by superstitions fears as to the origin of his misfortunes, he had delivered to Sheldon, afterwards archbishop of Canterbury, a written vow (now in the library of St Paul's cathedral) to restore all church lands held by the crown on his restoration to the throne; and almost his last injunction to the prince of Wales was that of fidelity to the national church. His present firmness, however, in its support was caused probably less by his devotion to it than by his desire to secure the failure of the whole treaty, and his attempts to escape naturally weakened the chances of success. Cromwell now supported the petitions of the army against the treaty. On the 19th of November the council of officers demanded the abdication of the king, "the capital and greatest of his delinquencies," and on the 27th of November the parliamentary commissioners returned from Newport without having secured Charles's consent. Charles was removed to Hurst Castle on the 1st of December, where he remained till the 19th, thence being taken to Windsor, where he arrived on the 23rd. On the 6th "Pride's Purge" had removed from the Commons all those who might show any favour to the king. On the 27th a last attempt by the council of officers to come to terms with him was repulsed. On the 1st of January the remnant of the Commons resolved that Charles was guilty of treason by "levying war against the parliament and kingdom of England"; on the 4th they declared their own power to make laws without the lords or the sovereign, and on the 6th established a "high court of justice" to try the king. On the 10th Charles was brought to St James's Palace, and on the next day his trial began in Westminster Hall, without the assistance of any of the judges, who all refused to take part in the proceedings. He laughed aloud at hearing himself called a traitor, and immediately demanded by what authority he was tried. He had been in treaty with the parliament in the Isle of Wight and taken thence by force; he saw no lords present. He was told by Bradshaw, the president of the court, that he was tried by the authority of the people of England, who had elected him king; Charles making the obvious reply that he was king by inheritance and not by election, that England had been for more than 1000 years an hereditary kingdom, and Bradshaw cutting short the discussion by adjourning the court. On the 22nd Charles repeated his reasoning, adding, "It is not my case alone; it is the freedom and liberty of the people of England, and do you pretend what you will, I stand more for their liberties, for if power without law may make laws... I do not know what subject he is in England that can be sure of his life or anything that he calls his own." On the 23rd he again refused to plead. The court was adjourned, and there were several signs that the army in the prosecution of the king had not the nation at their back. While the soldiers had shouted "Justice! justice!" as the king passed through their ranks, the civilian spectators from the end of the hall had cried "God save the king!" There was considerable opposition and reluctance to proceed among the members of the court. On the 26th, however, the court decided unanimously upon his execution, and on the 27th Charles was brought into court for the last time to hear his sentence. His request to be heard before the Lords and Commons was rejected, and his attempts to answer the charges of the president were silenced. Sentence was pronounced, and the king was removed by the soldiers, uttering his last broken protest: "I am not suffered to speak. Expect what justice other people will have.

In these last hours Charles, who was probably weary of life, showed a remarkable dignity and self-possession, and a firm resignation supported by religious faith and by the absolute conviction of his own innocence, which, says Burnet, "amazed all people and that so much the more because it was not natural that the enemy in the prosecution of the king had not the nation with him within himself that he went through so many indignities with so much true greatness without disorder or any sort of affectation." Nothing in his life became Charles like the leaving it. "He nothing common did or mean Upon that memorable scene." On the morning of the 29th of January he said his last farewell to his younger children, Elizabeth and Henry, duke of Gloucester. On the 30th at ten o'clock he walked across from St James's to Whitehall, calling on his guard "in a pleasant manner" to walk apace, and at two he stepped upon the scaffold from a window, probably the middle one, of the Banqueting House (see Architecture, Plate VI., fig. 75). He was separated from the people by large ranks of soldiers, and his last speech only reached Juxon and those with him on the scaffold. He declared that he had desired the liberty and freedom of the people as much as any; "but I must tell you that their liberty and freedom consists in having government... it is not their having a share in the government; it is nothing appertaining unto them. A subject and a sovereign are clear of each other; I am one with you; I am not one with you. I am nothing in the kingdom." Together with his declaration that he died a member of the Church of England, and the mysterious "Remember," spoken to Juxon, were Charles's last words. "It much discontents the citizens," wrote a spectator; "ye manner of his departure was very resolutely with some smiling countenances, intimating his willingness to be out of his troubles." 1 "The blow I saw given," wrote another, Philip Henry, "and can truly say with a sad heart, at the instant whereof, I remember well, there was such a groan by the Thoroughs then present as I never heard before and desire I may never hear again. There was according to

1 Notes and Queries, 7th ser., viii. 326.
order one Troop immediately marching from Charing-Cross to Westminster and another from Westminster to Charing-Cross, purposely to masker" (i.e. to over-power) "the people and to disperse and scatter them, so that I had much ado amongst the rest to escape home without hurt." ¹

Amidst such scenes of violence was at last effected the destruction of Charles. "It is lawful," wrote Milton, "and hath been held so through all ages for any one who have the power to call to account a Tyrant or wicked King and after due conviction to depose and put him to death." ² But here (it might well be contended) there had been no "due conviction." The execution had been the act of the king's personal enemies, of "only some fifty or sixty governing Englishmen with Oliver Cromwell in the midst of them" (i.e. act technically illegal, morally unjustifiable because the supposed crimes of Charles had been condoned by the later negotiations with him, and indefensible on the ground of public expediency, for the king's death proved a far greater obstacle to the establishment of the Commonwealth than his life could have been. The result was an extraordinary revulsion of feeling in favour of Charles and the monarchy, in which the incidents of his misgovernment were completely forgotten. He soon became in the popular veneration a martyr and a saint. His fate was compared with the Crucifixion, and his trials and sufferings to those of the Saviour. Handkerchiefs dipped in his blood wrought "miracles," and the Eikon Basilike, published on the day of his funeral, presented to the public a touching if not a genuine portrait of the unfortunate sovereign. At the Restoration the anniversary of his death was ordered to be kept as a day of fasting and humiliation, and the service appointed for use on the occasion was only removed from the prayer-book in 1839. The same conception of Charles as a martyr for religious appeals still to many, and has been stimulated by modern writers. ³ Had Charles been willing to abandon the church and give up episcopacy," says Bishop Creighton, "he might have saved his throne and his life. But on this point Charles stood firm, for this he died and by dying saved it for the future." ⁴ Gladstone, Keble, Newman write in the same strain. "It was for the Church," says Gladstone, "that Charles shed his blood upon the scaffold." ⁵ "I rest," says Newman, "on the scenes of past years, from the Upper Room in Acts to the Court of Carisbrooke and Uxbridge." The injustice and violence of the king's death, however, the pathetic dignity of his last days, and the many noble traits in his character, cannot blind us to the real causes of his downfall and destruction, and a sober judgment cannot allow that Charles was really a martyr either for the church or for the popular liberties.

The constitutional struggle between the crown and parliament had not been initiated by Charles I. It was in full existence in the reign of James I, and distinct traces appear towards the latter part of that of Elizabeth. Charles, therefore, in some degree inherited a situation for which he was not responsible, nor can he be justly blamed, according to the ideas of kingship which then prevailed, for defending the prerogatives of the crown as precious and sacred personal possessions which it was his duty to hand down intact to his successors. Neither will his persistence in refusing to yield up the control of the executive to the parliament or the army, or his zeal in defending the national church, be altogether censured. In the event the parliament proved quite incapable of governing, an army uncontrolled by the sovereign was shown to constitute a more grievous tyranny than Charles's most arbitrary rule, and the downfall of the church seen to make room only for a sectarian despotism as intolerable as the Laudian. The natural inference might be that both conceptions of government had much to support them, that they were bound sooner or later to come into collision, and that the actual individuals in the drama, including the king himself, were rather the victims of the greatness of events than real actors in the scene, still less the controllers of their own and the national destiny. A closer insight, however, shows that biographical more than abstract historical elements determined the actual course and issue of the Rebellion. The grossly constitutional and religious points of dispute between the king and parliament, though doubtless involving principles vital to the national interests, would not alone have sufficed to destroy Charles. Monarchy was too much venerated, was too deeply rooted in the national life, to be hastily and easily extirpated; the perils of removing the foundation of all government, law and order were too obvious not to be shunned at almost all costs. Still less can the crowning tragedy of the king's death find its real explanation or justification in these disputes and antagonisms. The real cause was the complete discredit into which Charles had brought himself and the monarchy. The ordinary routine of daily life and of business cannot continue without some degree of mutual confidence between the individuals brought into contact, far less could relations be maintained by a king endowed with the enormous powers then attached to the kingship, and with whom agreements, promises, negotiations were merely subterfuges and prevarications. We have seen the series of unhappy falsehoods and deceptions which constituted Charles's statecraft, beginning with the fraud concerning the concessions to the Roman Catholics at his marriage, the evasions with which he met the Petition of Right, the abandonment of Strafford, the simultaneous negotiation with, and betrayal of, all parties. Strafford's reported words on hearing of his desertion by Charles, "Put not your trust in princes," re-echo through the whole of Charles's reign. It was the degradation and dishonour of the kingship, and the personal loss of credit which Charles suffered through these transactions—which never appear to have caused him a moment's regret or uneasiness, but the fatal consequences of which were seen only too clearly by men like Hyde and Falkland—that were the real causes of the rebellion and of the king's execution. The constitutional and religious grievances were the outward and visible sign of the corroding suspicions which slowly consumed the national loyalty. In themselves there was nothing incapable of settlement either through the spirit of union which existed between Elizabeth and her subjects, or by the principle of compromise which formed the basis of the constitutional settlement in 1668. The bond of union between his people and himself Charles had, however, early broken, and compromise is only possible between parties both of whom can acknowledge to some extent the force of the other's position, which can trust one another, and which are sincere in their endeavour to reach agreement. Thus on Charles himself chiefly falls the responsibility for the catastrophe.

His character and motives fill a large place in English history, but they have never been fully understood and possibly were largely due to physical causes. His weakness as a child was so extreme that his life was despaired of. He outgrew physical defects, and as a young man excelled in horsemanship and in the sports of the times, but always retained an impediment of speech. At the time of his accession his reserve and reticence were especially noticed. Buckingham was the only person who ever enjoyed his friendship, and after his death Charles placed entire confidence in no man. This isolation was the cause of an ignorance of men and of the world, and of an incapacity to appreciate the ideas, principles and motives of others, while it prepared at the same time a fertile soil for receiving those exalted conceptions of kingship, of divine right and prerogative, which came into vogue at this period, together with those exaggerated ideas of his own personal supremacy and importance to which minds not quite normal are always especially inclined. His character was marked by a weakness which shirked and postponed the settlement of difficulties, by a meanness and ingratitude even when dealing with his most devoted followers, by an obstinacy which only feigned compliance and by an untruthfulness which differed widely from his son's unblushing deceit, which found always some reservation or excuse, but which while more scrupulous was also more dangerous and insidious because employed continually as a principle of conduct. Yet Charles, in
up under the care successively of the countess of Dorset, William Cavendish, duke of Newcastle, and the marquess of Hertford. He accompanied the king during the campaigns of the Civil War, and sat in the parliament at Oxford, but on the 4th of March 1646 he was sent by Charles I. to the west, accompanied by Hyde and others who formed his council. Owing, however, to the mutual jealousies and misconduct of Goring and Grenville, and the prince’s own disregard and contempt of the council, his presence was in no way advantageous, and could not prevent the final overthrow of the king’s forces in 1646. He retired (17th of February) to Pendennis Castle at Falmouth, and on the approach of Fairfax (2nd of March) to Scilly, where he remained with Hyde till the 16th of April. Thence he fled to Jersey, and finally, refusing all the overtures from the parliament, and in opposition to the counsels of Hyde, who desired the prince to remain on English territory, he repaired to the queen at Paris, where he remained for two years. He is described at this time by Mme de Motteville as “well-made, with a swarthy complexion agreeing well with his fine black eyes, a large ugly mouth, a graceful and dignified carriage and a fine figure”; and according to the description circulated later for his capture after the battle of Worcester, he was over six feet tall.

He received instruction in mathematics from Hobbes, and was early initiated into all the refined arts of diplomacy. In July 1648 the prince joined the royalist fleet and blockaded Deal with a fleet of eleven ships, returning to Holland, where he received the news of the final royalist defeats and afterwards of the execution of his father. On the 14th of January 1649 he had forwarded to the council a signed carte blanche, granting any conditions provided his father’s life were spared. He immediately assumed the title of king, and was proclaimed in Scotland (5th of February) and in some parts of Ireland. On the 17th of September, after a visit to his mother at St Germain, Charles went to Jersey and issued a declaration proclaiming his rights; but, owing to the arrival of the fleet at Portsmouth, he was obliged, on the 13th of February 1650, to return again to Breda. The projected invasion of Ireland was delayed through want of funds till it was too late; Hyde’s mission to Spain, in the midst of Cromwell’s successes, brought no assistance, and Charles now turned to Scotland for aid. Employing the same unscrupulous and treacherous methods which had proved so fatal to his father, he simultaneously supported and encouraged the expedition of Montrose and the royalists, and negotiated with the covenanters. On the 1st of May he signed the first draft of a treaty at Breda with the covenanters, in which he accepted the Solemn League and Covenant, conceded the control of public and church affairs to the parliament and the kirk, and undertook to establish Presbyterianism in the three kingdoms. He also signed privately a paper repudiating Ormonde and the loyal Irish, and recalling the commissions granted to them. In acting thus he did not scruple to desert his own royalist followers, and to repudiate and abandon the great and noble Montrose, whose heroic efforts he was apparently merely using in order to extort better terms from the covenanters, and who, having been captured on the 4th of May, was executed on the 21st in spite of some attempts by Charles to procure for him an indemnity.

Thus perjured and disgraced the young king embarked for Scotland on the 2nd of June; on the 11th when off Heligoland he signed the treaty, and on the 23rd, on his arrival at Speymouth, before landing, he swore to both the covenanters. He proceeded to Falkland near Perth and passed through Aberdeen, where he saw the mutilated arm of Montrose suspended over the city gate. He was compelled to dismiss all his followers except Buckingham, and to submit to interminable sermons, which generally contained some new invective against his parents and himself. To Argyll he promised the payment of £40,000 at his restoration, doubtful the sum owing as arrears of the Scottish army unpaid when Charles I. was surrendered to the English at Newcastle, and entered into negotiations for marrying his daughter. In August he was forced to sign a further declaration, confessing his own wickedness in dealing with the Irish, his father’s blood-guiltiness, his mother’s idolatry, and his abhorrence
CHARLES II.

of prelacy, besides ratifying his allegiance to the covenants and to Presbyterianism. At the same time he declared himself secretly to King, dean of Tuar, "a true child of the Church of England, the true Cavalier," and avowed that "what concerns Ireland is in no ways binding"; while to the Roman Catholics in England he promised concessions and expressed his goodwill towards their church to Pope Innocent X. His attempt, called "The Start," on the 4th of October 1650, to escape from the fact of his renunciation of the papacy and to join Huntly and the rovastis in the north failed, and he was overtaken and compelled to return. On the 1st of January 1651 he was crowned at Scone, when he was forced to repeat his oaths to both the covenants.

Meanwhile Cromwell had advanced and had defeated the Presbyterians at Dunbar on the 3rd of September 1650, subsequently occupying Edinburgh. This defeat was not wholly unwelcome to Charles in the circumstances; in the following summer, during Cromwell’s advance to the north, he shook off the Presbyterian influence, and on the 31st of July 1651 marched south into England with an army of about 10,000 commanded by David Leslie. He was proclaimed king at Carlisle, joined by the earl of Derby in Lancashire, evaded the troops of Lambert and Harrison in Cheshire, marched through Shropshire, and entered Worcester with a small, tired and dispirited force of only 16,000 men (22nd of August). Here the decisive battle, which ruined his hopes, and in which Charles distinguished himself by conspicuous courage and fortitude, was fought on the 3rd of September. After leading an unsuccessful cavalry charge against the enemy he fled, about 6 P.M., accompanied by Buckingham, Derby, Wilmot, Lauderdale and others, towards Kidderminster, taking refuge at White ladies, about 25 m. from Worcester, where he separated himself from all his followers except Wilmot, concealing himself in the famous oak during the 6th of September, moving subsequently to Boscobel, to Moseley and Bentley Hall, and thence, disguised as Miss Lane’s attendant, to Abbots Leigh near Bristol, to Trent in Somersetshire, and finally to the George Inn at Brighton, having been recognized during the forty-one days of his wanderings by about fifty persons, none of whom, in spite of the reward of £1,000 offered for his capture, or of the death penalty threatened for aiding his concealment, had betrayed him. He sailed from thence on the 15th of October 1651, and landed at Fécamp in Normandy the next day. He resided at Paris at St Germain till June 1654, in inactivity, unable to make any further effort, and living with difficulty on a grant from Louis XIV. of 600 livres a month. Various missions to foreign powers met with failure; he was excluded from Holland by the treaty made with England in April 1654, and he anticipated his expulsion from France, owing to the new relations of friendship established with Cromwell, by quitting the country in July. He visited his sister, the princess of Orange, at Spa, and went to Aix-la-Chapelle, thence finally proceeding in November to Cologne, where he was hospitably received. The conclusion of Cromwell’s treaty with France in October 1655, and the war between England and Spain, gave hope of aid from the latter power. In April 1656 Charles went to Bruges, and on the 7th of February 1658 to Brussels, where he signed a treaty with Don John of Austria, governor of the Spanish Netherlands, by which he received in allowance in place of his French pension and undertook to assemble all his subjects in France in aid of the Spanish against the French. This plan, however, came to nothing; projected risings in England were betrayed, and by the capture of Dunkirk in June 1658, after the battle of the Dunes, by the French and Cromwell’s Ironsides, the Spanish cause in Flanders was ruined.

As long as Cromwell lived there appeared little hope of the restoration of the monarchy, and Charles and Hyde had been aware of the plots for his assassination, which had aroused no disapproval. By the protector’s death on the 3rd of September 1658 the scene was wholly changed, and amidst the consequent confusion of factions the cry for the restoration of the monarchy grew daily in strength. The premature royalist rising, however, in August 1659 was defeated, and Charles, who had awaited the result on the coast of Brittany, proceeded to Fuenterrabia on the Spanish frontier, where Mazarin and Luis de Haro were negotiating the treaty of the Pyrenees, to induce both powers to support his cause; but the failure of the attempt in England ensured the rejection of his request, and he returned to Brussels in December, visiting his mother at Paris on the way. Events had meanwhile developed fast in favour of a restoration. Charles, by Hyde’s advice, had not interfered in the movement, and had avoided inconvenient concessions to the various factions by referring all to a “free parliament.” He left Brussels for Breda, and issued in April 1660, together with the letters to the council, the officers of the army and the houses of parliament and the city, the declaration of an amnesty for all except those specially excluded afterwards by parliament, which referred to parliament the settlement of estates and promised a liberty to tender consciences in matters of religion not contrary to the peace of the kingdom.

On the 8th of May Charles II. was proclaimed king in Westminster Hall and elsewhere in London. On the 24th he sailed from the Hague, landing on the 26th at Dover, where he was met by Monk, whom he saluted as father, and by the mayor, from whom he accepted a “very rich bible,” of the thing that he loved to see in all things in “5.” He returned on the 29th, his thirtieth birthday, arriving with the procession, amidst general rejoicings and “through a lane of happy faces,” at seven in the evening at Whitehall, where the houses of parliament awaited his coming, to offer in the name of the nation their congratulations and allegiance.

No event in the history of England had been attended with more lively and general rejoicing than Charles’s restoration, and none was destined to cause greater subsequent disappointment and disillusion. Indolent, sensual and dissipated by nature, Charles’s vices had greatly increased during his exile abroad, and were now, with the great turn of fortune which gave him full opportunity to indulge them, to surpass all the bounds of decency and control. A long residence till the age of thirty abroad, together with his French blood, had made him politically more of a foreigner than an Englishman, and he returned to England ignorant of the English constitution, a Roman Catholic and a secret adversary of the national religion, and untouched by the movement of the greater or of patriotism. Pure selfishness was the basis of his policy both in domestic and foreign affairs. Abroad the great national interests were eagerly sacrificed for the sake of a pension, and at home his personal ease and pleasure alone decided every measure, and the fate of every minister and subject. During his exile he had surrounded himself with young men of the same spirit as himself, such as Buckingham and Bennet, who, without having any claim to statesmanship, inattentive to business, neglectful of the national interests and national prejudices, became Charles’s chief advisers. With them, as with their master, public office was only desirable as a means of procuring enjoyment, for which an absolute monarchy provided the most favourable conditions. Such persons were now, accordingly, destined to supplant the older and responsible ministers of the type of Clarendon and Ormonde, men of high character and patriotism, who followed definite lines of policy, while at the same time the younger men of ability and standing were shut out from office. The period of Charles II.’s reign (1660–1667) was that of the administration of Lord Clarendon, the principal author of the Restoration settlement. The king was granted the large revenue of £1,300,000. The naval and military forces were disbanded, but Charles managed to retain under the name of guards three regiments, which remained the nucleus of a standing army. The settlement of estates on a legal basis provided ill for a large number of the king’s adherents who had impoverished themselves in his cause. The king’s honour was directly involved in their compensation and, except for the gratification of a few individuals, was tarnished by his neglect to afford them relief. Charles used his influence to carry through parliament the act of indemnity, and the execution of some of the regicides was a measure not more severe than was to be expected in the times and circumstances;
but that of Sir Henry Vane, who was not a recidive and whose life Charles had promised the parliament to spare in case of his
condemnation, was brought about by Charles's personal insistence
in revenge for the victim's high bearing during his trial, and was
an act of gross cruelty and perfidy. Charles was in favour of
religious toleration, and a declaration issued by him in October
1660 aroused great hopes; but he made little effort to conciliate
the Presbyterians or to effect a settlement through the Savoy
conference, and his real object was to gain power over all the
factions and to free his co-religionists, the Roman Catholics, in
favour of whom he issued his first declaration of indulgence (26th
of December 1662), the bill to give effect to it being opposed by
Clarendon and defeated in the Lords, and being referred to by the
passing of further acts against religious liberty. Meanwhile the
plot of Venner and of the Fifth Monarchy men had been suppressed
in January 1661, and the king was crowned on the 23rd of April.
The convention parliament had been dissolved on the 29th of
December 1660, and Charles's first parliament, the Long Parlia-
mament of the Restoration, which met on the 8th of May 1661 and
continued till January 1675, declared the command of the forces
in Ireland to be an act of rebellion. The taking up of arms against
the king was repudiated by the Act of Triennial 1664, repealing
and repealed in 1668 the Triennial Act, adding only a
provision that there should not be intermission of parliaments for
more than three years. In Ireland the church was re-established,
and a new settlement of land introduced by the Act of Settle-
ment 1661 and the Act of Explanation 1665. The island was
excluded from the benefit of the Navigation Laws, and in 1666 the
importation of cattle and horses into England was forbidden. In
Scotland episcopacy was set up, the covenant to which Charles
had taken so many solemn oaths burnt by the common hangman,
and Argyll brought to the scaffold, while the kingdom was given
to the savage and corrupt administration of Lauderdale.
On the 21st of May 1662, in pursuance of the pro-French and
anti-Spanish policy, Charles married Catherine of Braganza, daugh-
ter of John IV. of Portugal, by which alliance England obtained
Tangier and Bombay. She brought him no children, and her
attractions for Charles were inferior to those of his mistress, Lady
Castlemaine, whom she was compelled to receive as a lady of his
bedchamber. In February 1665 the ill-omened war with Spain
was declared, during the progress of which it became apparent
how greatly the condition of the national services and the state
of administration had deteriorated since the Commonwealth,
and to what extent England was isolated and abandoned abroad.
Michael de Ruyter, on the 13th of June 1667, carrying out his
celebrated attack on Chatham and burning several warships.
The disgrace was unprecedented. Charles did not show himself
and it was reported that he had abdicated, but to allay the popular
panic it was given out "that he was very cheerful that night at
supper with his mistresses." The treaty of Breda with Holland
(21st of July 1667) removed the danger, but not the ignominy,
and Charles showed the real baseness of his character when he
joined in the popular outcry against Clarendon, the upright
and devoted adherent of his father and himself during twenty-five
years of misfortune, and drove him into poverty and exile in his
old age, recalling ominously Charles I's betrayal of Strafford.
To Clarendon now succeeded the ministry of Buckingham
and Lord Ashley, who with Laud and Harley (afterwards Lord
Shaftesbury) and Clifford, constituted the so-called Cabal ministry
in 1672. With these advisers Charles entered into those schemes
so antagonistic to the national interests which have disgraced
his reign. His plan was to render himself independent of parlia-
mament and of the nation by binding himself to France and the
French policy of aggrandizement, and receiving a French pen-
sion with the secret intention as well of introducing the Roman
Catholic religion again into England. In 1663 under Clarendon's
rule, the evil precedent had been admitted of receiving money
from France, in 1662 Dunkirk had been sold to Louis, and in
February 1667 during the Dutch war a secret alliance had been
made with Louis, Charles promising him a free hand in the
Netherlands and Louis undertaking to support Charles's designs
"in or out of the kingdom." In January 1668 Sir W. Temple
had made with Sweden and Holland the Triple Alliance against
the encroachments and aggrandizement of France, but this
national policy was soon upset by the king's own secret plans.
In 1668 the conversion of his brother James to Romanism was
known to Charles. Already in 1662 the king had sent Sir Richard
Bellings to Rome to arrange the terms of England's conversion,
and now in 1668 he was in correspondence with Oliva, the general
of the Jesuits in Rome, through James de la Cloche, the eldest
of his natural sons, of whom he had become the father when
scarcely sixteen during his residence at Jersey. On the 25th of
January 1669, at a secret meeting between the two royal brothers,
with Arlington, Clifford and Arundell of Wardour, it was deter-
mined to announce to Louis XIV. the projected conversion
of Charles and the realm, and subsequent negotiations terminated
in the two secret treaties of Dover. The first, signed only among
the ministers, by Arlington and Clifford, the rest not being
initiated, on the 20th of May 1670, provided for the return of
England to Rome and the joint attack of France and
England upon Holland, England's ally, together with Charles's
support of the Bourbon claims to the throne of Spain, while
Charles received a pension of £200,000 a year. In the second,
since secreted, concluding with Buckingham, Kent, Arundell and
Ashley on the 25th of December 1670, nothing was said about the
conversion and the pension provided for that purpose was added to
the military subsidy, neither of these treaties being communicated
to parliament or to the nation. An immediate gain to Charles was
the acquisition of another mistress in the person of Louise de
Kéroualle, the so-called "Madam Carwell," who had accompanied
the duchess of Orleans, the king's sister, to Dover, at the time of
the negotiations, and who joined Charles's seraglio, being created
duchess of Portsmouth, and acting as the agent of the French
alliance throughout the reign.
On the 24th of October 1670, at the very time that these
treaties were in progress, Charles opened parliament and obtained
a vote of £800,000 on the plea of supporting the Triple Alliance.
Parliament was prorogued in April 1671, not assembling again
till February 1673, and on the 2nd of January 1672 was announced
the "stop of the exchequer," or national bankruptcy, one of
the most blameworthy and unscrupulous acts of the reign, by
which the payments from the exchequer ceased, and large
numbers of persons who had lent to the government were thus
ruined. On the reassembling of parliament on the 4th of
February 1673 a strong opposition was shown to the Cabal
ministry which had been constituted at the end of 1672. The
Dutch War, declared on the 17th of March 1672, though the com-
mercial and naval jealousies of Holland had certainly not dis-
appeared in England, was unpopular because of the alliance with
France and the attack upon Protestantism, while the king's
second declaration of indulgence (15th of March 1672) aroused
still further antagonism, was declared illegal by the parliament,
and was followed up by the Test Act, which obliged James and
Clifford to resign their offices. In February 1674 the war with
Holland was closed by the treaty of London or of Westminster,
though Charles still gave Louis a free hand in his aggressive
policy towards the Netherlands, and the Cabal was driven
from office. Danby (afterwards duke of Leeds) now became
chief minister; but, though in reality a strong supporter of the
national policy, he could not have to keep his place without
again interfering in the king's schemes. In November 1675 Charles
again prorogued parliament, and did not summon it again till
February 1677, when it was almost immediately prorogued.
On the 17th of February 1676, with Danby's knowledge, Charles
concluded a further treaty with Louis by which he undertook to
subordinate entirely his foreign policy to that of France, and
received an annual pension of £600,000. On the other hand,
Danby succeeded in effecting the marriage (4th of November
1677) between William of Orange and the princess Mary, which
proved the most important political event in the whole reign.
Louis revenged himself by intriguing with the Opposition and
by turning his streams of gold in that direction, and a further
treaty with France for the annual payment to Charles of £3,500,000
and the dismissal of his parliament, concluded on the 17th of
May 1678, was not executed. Louis made peace with Holland
at Nijmegen on the 10th of August, and punished Danby by disclosing his secret negotiations, thus causing the minister's fall and the government's collapse. To save Danby, Charles now prorogued the parliament on the 30th of December, dissolving it on the 24th of January 1679.

Meanwhile the "Popish Plot," the creation of a band of informers encouraged by Shaftesbury and the most violent and unscrupulous of the extreme Protestant party in order to exclude James from the throne, had thrown the whole country into a panic. Charles's conduct in this conjuncture was highly characteristic and was marked by his usual cynical selfishness. He carefully refrained from incurring suspicion and unpopularity by opposing the general outcry, and though he saw through the imposture from the beginning he made no attempt to moderate the popular frenzy or to save the life of any of the victims, his co-religionists, not even intervening in the case of Lord Stafford, and allowing Titus Oates to be lodged at Whitehall with a pension. His policy was to take advantage of the violence of the faction, to "give them line enough," to use his own words, to encourage it rather than repress it, with the expectation of procuring finally a strong royalist reaction.

In his resistance to the great movement for the exclusion of James from the succession, Charles was aided by moderate men such as Halifax, who desired only a restriction of James's powers, and still more by the violence of the extreme exclusionists themselves, who headed by Shaftesbury brought about their own downfall and that of their cause by their support of the legitimacy and claims of Charles's natural son, the duke of Monmouth. In 1679 Charles denied, in council, his supposed marriage with Lucy Walter, Monmouth's mother, his declarations being published in 1680 to refute the legend of the black box which was supposed to contain the contract of marriage, and told Burnet he would rather see him hanged than legitimize him. He deprived him of his general's commission in consequence of his quasi-royal progress about the country, and in December on Monmouth's return to England he was forbidden to appear at court. In February 1679 the king had consented to order James to go abroad, and even approved of the attempt of the prime and the bishop of Winchester to convert him to Protestantism.

To weaken the opposition to his government Charles accepted Sir W. Temple's new scheme of governing by a council which included the leaders of the Opposition, and which might have become a rival to the parliament, but this was an immediate failure. In May 1679 he prorogued the new parliament which had attained Danby, and in July dissolved it, while in October he prorogued another parliament of the same mind till January and finally till October 1680, having resolved "to wait till this violence should wear off." He even made overtures to Shaftesbury in November 1679, but the latter insisted on the departure of both the queen and James. All attempts at compromise failed, and on the assembling of the parliament in October 1680 the Exclusion Bill passed the Commons, being, however, thrown out in the Lords through the influence of Halifax. Charles dissolved the parliament in January 1681, declaring that he would never pass the Exclusion Bill, and summoned another at Oxford, which met there on the 21st of March 1681, Shaftesbury's faction arriving accompanied by armed bands. Charles expressed his willingness to consent to the handing over of the administration to the control of a Protestant, in the case of a Roman Catholic sovereign, but the Opposition insisted on Charles's nomination of Monmouth as his successor, and the parliament was accordingly once more (28th of March) dissolved by Charles, while a royal proclamation ordered to be read in all the churches proclaimed the ill-deeds of the parliament and the king's affection for the Protestant religion.

Charles's tenacity and clever tact were now rewarded. A great popular reaction ensued in favour of the monarchy, and a large number of loyal addresses were sent in, most of them condemning the Exclusion Bill. Shaftesbury was imprisoned, and though the Middlesex jury threw out his indictment and he was liberated, he never recovered his power, and in October 1682 left England for ever. The Exclusion Bill and the limitation of James's powers were no more heard of, and full liberty was granted to the king to pursue the retrograde and arbitrary policy to which his disposition naturally inclined. In Scotland James set up a tyrannical administration of the worst type. The royal enmity towards William of Orange was increased by a visit of the latter to England in July. No more parliaments were called, and Charles persisted on his permanent revenue and his French pensions. He continued the policy of double-dealing and treachery, deceiving his ministers as at the treaty of Dover, by pretending to support Holland and Spain while he was secretly engaged to Louis to betray them. On the 22nd of March 1681 he entered into a compact with Louis whereby he undertook to desert his allies and offer no resistance to French aggressions. In August he joined with Spain and Holland in a manifesto against France, while secretly for a million livres he engaged himself to Louis, and in 1682 he proposed himself as arbitrator with the intention of treacherously handing over Luxembourg to France, an offer which was rejected owing to Spanish suspicions of collaboration. In the event, Charles's duplicity enabled Louis to seize Strassburg in 1681 and Luxembourg in 1684. The government at home was carried on principally by Rochester, Sunderland and Godolphin, while Guilford was lord chancellor and Jeffreys lord chief justice. The laws against the Nonconformists were strictly enforced. In order to obtain servile parliaments and also obsequious juries, who with the co-operation of judges of the stamp of Jeffreys could be depended upon to carry out the wishes of the court, the borough charters were confiscated, the charter of the city of London being forfeited on the 12th of June 1683.

The popularity of Charles, now greatly increased, was raised to national enthusiasm by the discovery of the Rye House plot in 1683, said to be a scheme to assassinate Charles and James at an isolated house on the high road near Hoddesdon in Hertfordshire as they returned from Newmarket to London, among those implicated being Algernon Sidney, Lord Russell and Monmouth, the two former paying the death penalty and Monmouth being finally banished to the Hague. The administration became more despotic, and Tangier was abandoned in order to reduce expenses and to increase the forces at home for overawing opposition. The first preliminary steps were now taken for the reintroduction of the Roman Catholic religion. Danby and those confined on account of participation in the popish plot were liberated, and Titus Oates thrown into prison. A scheme was announced for withdrawing the control of the army in Ireland from Rochester, the lord-lieutenant, and placing it in the king's own hands, and the commission to which the king had delegated ecclesiastical patronage was revoked. In May 1684 the office of lord high admiral, in spite of the Test Act, was again given to James, who had now returned from Scotland. To all appearances the same policy afterwards pursued so recklessly and disastrously by James was now cautiously initiated by Charles, who, however, not being inspired by the same religious zeal as his brother, and not desiring " to go on his travels again," would probably have drawn back prudently before his throne was endangered. The developments of this movement were, however, now interrupted by the death of Charles after a short illness on the 6th of February 1685. He was buried on the 17th in Henry VII.'s chapel in Westminster Abbey with funeral ceremonies criticized by contemporaries as mean and wanting in respect, but the scantiness of which was probably owing to the fact that he had died a Roman Catholic.

On his death-bed Charles had at length declared himself an adherent of that religion and had received the last rites according to the Romanist usage. There appears to be no trustworthy record of his formal conversion, assigned to various times and various agencies. As a youth, says Clarendon, "the ill-bred familiarity of the Scotch divines had given him a distaste for Presbyterianship, which he indeed declared " no religion for gentlemen," and the mean figure which the fallen national church made in exile repelled him at the same time that he was attracted by the "civility of the Catholic religion." With Charles religion was not the serious matter it was with James, and was largely regarded from the political aspect and from that
of ease and personal convenience. Presbyterianism constituted a dangerous encroachment on the royal prerogative; the national church and the cavalier party were indeed the natural supporters of the authority of the crown, but on the other hand they refused to countenance the dependence upon France; Roman Catholicism at that moment was the obvious medium of governing without parliaments, of French pensions and of reigning without trouble, and was naturally the faith of Charles's choice. Of the two papers in defence of the Roman Catholic religion in Charles's own hand, published by James, Halifax says "though neither his temper nor education made him very fit to be an author, yet in this case ... he might write it all himself and yet not one word of it his own."

Of his amours and mistresses the same shrewd observer of human character, who was also well acquainted with the king, declares "that his inclinations to love were the effects of health and a good constitution with as little mixture of the serpentine part as ever man had. ... I am apt to think his stayed as much as any man's ever did in the lower region." His health was the one subject to which he gave unremitting attention, and his fine constitution and devotion to all kinds of sport and physical exercise kept off the effects of uncontrolled debauchery for thirty years. In later years the society of his mistresses seems to have been chiefly acceptable as a means to avoid business and petitioners, and in the case of the duchess of Portsmouth the price was paid for ease and the continuance of the French pensions. His ministers he never scurped to sacrifice to his ease. The love of ease exercised an entire sovereignty in his thoughts. "The motive of his giving bounties was rather to make men less uneasy to him than more easy to themselves." He would rob his own treasury and take bribes to press a measure through the council. He had a natural affability, but too general to be much valued, and he was fickle and deceitful. Neither gratitude nor revenge moved him, and good or ill services left little impression on his mind. Halifax, however, concludes by desiring to moderate the roughness of his picture by emphasizing the excellence of his intellect and memory and his mechanical talent, by deprecating a too censorious judgment and by dwelling upon the disadvantages of his bringing up, the difficulties and temptations of his position, and on the fact that his vices were those common to human frailty. His capacity for kingcraft, knowledge of the world, and easy address enabled him to surmount difficulties and dangers which would have proved fatal to his father or to his brother. "It was a common saying that he could send away a person better pleased at receiving nothing than those in the good king his father's time that had requested them," and his good-humoured tact and familiarity compensated for and concealed his ingratitude and perfidy and preserved his popularity. He had good taste in art and literature, was fond of chemistry and science, and the Royal Society was founded in his reign. According to Evelyn he was "débonnaire and easy of access, naturally kind-hearted and possessed an excellent temper," virtues which covered a multitude of sins.

These small traits of amiability, however, which pleased his contemporaries, cannot disguise for us the broad lines of Charles's character and nature. How far the extraordinary corruption of private morals which has gained for the restoration period so unenviable a notoriety was owing to the king's own example of flagrant debauchery, how far to the natural reaction from an artificial Puritanism, is uncertain, but it is incontestable that Charles's cynical selfishness was the chief cause of the degradation of public life which marks his reign, and of the disgraceful and unscrupulous betrayal of the national interests which raised France to a threatening predominance and imperilled the very existence of Britain for generations. The reign of his predecessor Charles I., and even of that of his successor James II., with their mistaken principles and ideals, have a saving dignity wholly wanting in that of Charles II., and the administration of Cromwell, in spite of the popularity of the restoration, was soon regretted. "A lazy Prince," writes Pepys, "no Council, no money, no reputation at home or abroad. It is strange

[MEM. OF THOMAS, EARL OF ALSTON, P. 95]
Soissons, but the victory remained with his party, who elected Rudolph, duke of Burgundy, king. In his extremity Charles trusted himself to Hubert, count of Vermandois, who deceived him, and threw him into confinement at Château-Thierry and afterwards at Péronne. In the latter town he died on the 7th of October 929. In 907 he had married Frederona, sister of Bovo, bishop of Chalon. After her death he married Eadgyvæ (Odgiva), daughter of Edward the Elder, king of the English, who was the mother of Louis IV.

CHARLES IV. (1294–1328), king of France, called THE FAIR, was the third and youngest son of Philip IV. and Jeanne of Navarre. In 1316 he was created count of La Marche, and succeeded his brother Philip V. as king of France and Navarre early in 1322. He followed the policy of his predecessors in enforcing the royal authority over the nobles, but the machinery of a centralized government strong enough to hold nobility in check increased the royal expenditure, to meet which Charles had recourse to doubtful financial expedients. At the beginning of his reign he ordered a recast of the coinage, with serious results to commerce; civil officials were deprived of offices, which had been conferred free, but were now put up to auction; duties on imports were increased, and this new burden of goods brought into Paris; the practice of exacting heavy fines was encouraged by making the salaries of the magistrates dependent on them; and on the pretext of a crusade to free Armenia from the Turks, Charles obtained from the pope a tithe levied on the clergy, the proceeds of which he kept for his own use; he also confiscated the property of the Lombard bankers who had been invited to France by his father at a time of financial crisis. The history of the assemblies summoned by Charles IV. is obscure, but in 1326, on the outbreak of war with England, an assembly of prelates and barons met at Meaux. Commissioners were afterwards despatched to the provinces to state the position of affairs and to receive complaints. The king justified his failure to summon the estates on the ground of the expense incurred by provincial deputies. The external politics of his reign were not marked by any striking events. He maintained excellent relations with Pope John XXII., who made overtures to him, indirectly, offering his support in case of his candidature for the imperial crown. Charles tried to form a party in Italy in support of the pope against the emperor Louis IV. of Bavaria, but failed. When the English, who had the goods confiscated of Agens for France was followed by a feudal war in Guienne. Isabella, Charles’s sister and the wife of Edward II., was sent to France to negotiate, and with her brother’s help arranged the final conspiracy against her husband. Charles’s first wife was Blanche, daughter of Otto IV., count of Burgundy, and of Matilda (Mahaut), countess of Artois, to whom he was married in 1307. In May 1314, by order of King Philip IV., she was arrested and imprisoned in the Château-Gaillard with her sister-in-law Marguerite, daughter of Robert II., duke of Burgundy, and wife of Louis Huitin, on the charge of adultery with two gentlemen of the royal household, Philippe and Gautier d'Aunay. Jeanne, sister of Marguerite and wife of Philip the Tall, was also arrested for not having denounced the culprits, and imprisoned at Dourdan. The two knights were put to the torture and executed, and their goods confiscated. It is impossible to say how far the charges were true. Tradition has invoced and obscured the story, which is the origin of the legend of the tale de Néset made famous by the drama of A. Dumas the elder. Marguerite died shortly in prison; Jeanne was declared innocent by a jury of lay peers and returned to her husband. Blanche was still in prison when Charles became king. He induced Pope John XXII. to declare the marriage null, on the ground that Blanche's mother had been his godmother. Blanche died in 1326, still in confinement, though at the last in the abbey of Maubuisson.

In 1322, freed from his first marriage, Charles married his cousin Mary of Luxemburg, daughter of the emperor Henry VII., and upon her death, two years later, Jeanne, daughter of Louis, count of Evreux. Charles IV. died at Vincennes on the 1st of February 1328. He left no issue by his first two wives to succeed him, and daughters only by Jeanne of Evreux. He was the last of the direct line of Capetians.

CHARLES V. (1337–1380), king of France, called THE WISE, was born at the château de Vincennes on the 21st of January 1337, the son of John II. and Bonne of Luxemburg. In 1349 he became dauphin of the Viennois by purchase from Humbert II., and in 1355 he was created duke of Normandy. At the battle of Poitiers (1356) his father ordered him to leave the field when the battle turned against the French, and he was thus saved from the imprisonment that overtook his father. After arranging for the government of Normandy he proceeded to Paris, where he took the title of lieutenant of the kingdom. During the years of John II.’s imprisonment in England Charles was virtually king of France. He summoned the states-general of northern France (Lois d’oïl) and raised in Paris or Rouen to obtain men and money to carry on the war. But under the leadership of Étienne Marcel, provost of the Parisian merchants and president of the third estate, and Robert le Coq, bishop of León, president of the clergy, a partisan of Charles of Navarre, the states refused any “aid” except on conditions which Charles declined to accept. They demanded the dismissal of a number of the royal ministers; the establishment of a commission elected from the three estates to regulate the dauphin’s administration, and of another board to act as council of war; also the release of Charles the Bad, king of Navarre, who had been imprisoned by King John. The estates of Languedoc, summoned to Toulouse, also made protests against misgovernment, but they agreed to raise a war-levy on terms to which the dauphin acceded. Charles sought the alliance of his uncle, the emperor Charles IV., to whom he did homage at Metz as dauphin of the Viennois, and he was also made imperial vicar of Dauphiné, thus acknowledging the imperial jurisdiction. But he gained small material advantage from these proceedings. The states-general were again convoked at Orléans in 1357. Their demands were more moderate than in the preceding year, but, before they met, the merchants, in order to replace certain obnoxious persons on the royal council, endeavored the right to assemble without the royal summons, and certain administrative reforms. In return they promised to raise and finance an army of 30,000 men, but the money—a tithe levied on the annual revenues of the clergy and nobility—voted for this object was not to pass through the dauphin’s hands. Charles appeared to consent, but the agreement was annulled by letters from King John, announcing at the same time the conclusion of a two years’ truce, and the reformers failed to secure their ends. Charles had escaped from their power by leaving Paris, but he returned for a new meeting of the estates in the autumn of 1357.

Meanwhile Charles of Navarre had been released by his partisans, and allaying himself with Marcel had become a popular hero in Paris. The dauphin was obliged to receive him and to undergo an apparent reconciliation. In Paris Étienne Marcel was supreme. He forced his way into the dauphin’s palace (February 1358), and Charles’s servant, Jean de Conflans, was killed by the dauphin. The archbishop of Sens, and Robert de Clermont, marshal of Normandy, was arrested and before his death Charles was powerless to resist these outrages, but he obtained from the provincial assemblies the money refused him by the states-general, and deferred his vengeance until the dissensions of his enemies should offer him an opportunity. Charles of Navarre, now in league with the English and master of lower Normandy and of the approaches to Paris, returned to the immediate neighbourhood of the city, and Marcel found himself driven to avow co-operation with the dauphin’s enemies, the English
and the Navarrese. Charles had been compelled in March to take the title of regent to prevent the possibility of further intervention from King John. In defiance of a recent ordinance prohibiting provincial assemblies, he presided over the estates of Picardy and Artois, and then over those of Champagne. The states-general of 1358 were summoned to Compiègne instead of Paris, and granted a large aid. The condition of northern France was rendered more desperate by the outbreak (May-June 1358) of the peasant revolt known as the Jacquerie, which was repressed with a barbarity far exceeding the excesses of the rebels. Within the walls of Paris Jean Maillart had formed a royalist party; Marcel was assassinated (1st July 1358), and the dauphin entered Paris in the following month. A reaction in Charles's favour had set in, and from the estates of 1359 he regained the authority he had lost. It was with their full concurrence that he restored their honours to the officials who had been dismissed by the estates of 1356 and 1357. They supported him in repudiating the treaty of London (1359), which King John had signed in anxiety for his personal freedom, and voted money unconditionally for the continuation of the war. From this time the estates were only once convoked by Charles, who contented himself thenceforward by appeals to the assembly of notables or to his own discretion. On 22nd October 1360, with the regent; Edward III, landed at Calais in October; and a great part of the country was exposed to double depredations from the English and the Navarrese troops. In the scarcity of money Charles had recourse to the debasement of the coinage, which suffered no less than twenty-two variations in the two years before the treaty of Brétigny. This disastrous financial expedient was made good later, the coinage being established on a firm basis during the last sixteen years of Charles's reign in accordance with the principles of Nicolas Oresme. On the conclusion of peace King John was restored to France, but, being unable to raise his ransom, he returned in 1364 to England, where he died in April, leaving the crown to Charles, who was crowned at Reims on the 10th of May.

The new king found an able servant in Bertrand du Guesclin, who won a victory over the Navarrese troops at Cocherel and took prisoner their best general, Jean de Graillli, capital of Buch. The establishment of Charles's brother, Philip the Bold, in the duchy of Burgundy, though it constituted in the event a serious menace to the monarchy, put an end to the king of Navarre's ambition. By the peace of 1365, the treaty of Navarre, which the kings was signed in 1365, by which Charles of Navarre gave up Mantes, Meulan and the county of Longueville in exchange for Montpellier. Negotiations were renewed in 1370 when Charles of Navarre did homage for his French possessions, though he was then considering an offensive and defensive alliance with Edward III. Du Guesclin undertook to free France from the depredations of the "free companies," mercenary soldiers put out of employment by the cessation of the war. An attempt to send them on a crusade against the Turks failed, and Du Guesclin led them to Spain to put Henry of Trastamara on the throne of Castile. By the marriage of his brother Philip the Bold with Margaret of Flanders, Charles detached the Flemings from the English alliance, and as soon as he had restored something like order in the internal affairs of the kingdom he provoked a quarrel with the English. The text of the treaty of Brétigny presented technical difficulties of which Charles was not slow to avail himself. The English power in Guienne was weakened by the disastrous Spanish expedition of the Black Prince, whose Charles detached himself from Paris in January 1360 to answer the charges preferred against him by his subjects, thus expressly repudiating the English supremacy in Guienne. War was renewed in May after a meeting of the states-general. Between 1367 and 1373 Poitou and Saintonge were reconquered by Du Guesclin, and soon the English had to abandon all their territory north of the Garonne. John IV. of Brittany (Jean de Montfort) had won his duty with English help by the defeat of Charles of Blois, the French nominee, at Auray in 1364. His sympathies remained English, but he was now (1373) obliged to take refuge in England, and later in Flanders, while the English only retained a footing in two or three coast towns. Charles's generals avoided pitched battles, and contented themselves with defensive and guerrilla warfare, with the results that, in 1368, only Bayonne, Bordeaux, Brest and Calais were still in English hands.

Charles had in 1378 obtained proof of Charles of Navarre's reasonable designs. He seized the Norman towns held by the Navarrese, while Henry of Trastamara invaded Navarre, and imposed conditions of peace which rendered his lifelong enemy at last powerless. A premature attempt to amalgamate the duchy of Brittany with the French crown failed. Charles summoned the duke to Paris in 1378, and on his non-appearance committed one of his rare errors of policy by confiscating his duchy. But the Bretons rose to defend their independence, and recalled their duke. The matter was still unsettled when Charles died at Vincennes on the 10th of September 1380. His health, always delicate, had been further weakened, according to popular report, by a slow poison prepared for him by the king of Navarre. His wife, Jeanne of Bourbon, died in 1378, and the succession devolved on their elder son Charles, a boy of twelve. Their younger son was Louis, duke of Orléans.

Personally Charles was no soldier. He owed the signal successes of his reign partly to his skilful choice of advisers and advisors, from on, who conspired to scheme against Charles and his family. The anti-English party; Jean and Guillaume de Doms and Pierre d'Orgemont, to the latter, which protected Charles at the court of Paris, Bureau de la Riviére and others; partly to a singular coolness and subtilty in the exercise of a not over-scrupulous diplomacy, which made him a dangerous enemy. He had learnt prudence and self-restraint in the troubled times of the regency, and did not lose his moderation in success. He modelled his private life on that of his predecessor Saint Louis, but was no fanatic in religion, for he refused his support to the violent methods of the Inquisition in southern France, and allowed the Jews to return to the country, at the same time confirming their privileges. His support of the schismatic pope Clement VII. at Avignon was doubtless due to political considerations, as favouring the independence of the Gallican church. Charles V. was a student of astrology, medicine, law and philosophy, and collected a large and valuable library at the Louvre. He gathered round him a group of distinguished writers and thinkers, among whom were Raoul de Presles, Philippe de Mézières, Nicolas Oresme and others. The ideas of these men were applied by him to the practical work of administration, though he confined himself chiefly to the consolidation and improvement of existing institutions. The nobility was lessened by restrictions which, without prohibiting privileges, made them practically impossible. The feudal castles were regularly inspected by the central authority, and the nobles themselves became in many cases paid officers of the king. Charles established a merchant marine and a formidable navy, which under Jean de Vienne threatened the English coast between 1377 and 1380. The states-general were silenced and the royal prerogatives increased; the royal domains were extended, and the wealth of the crown was augmented; additions were made to the revenue by the sale of municipal charters and patents; and taxation became heavier, since Charles set no limits to the gratification of his tastes either in the collection of jewels and precious objects, of books, or of his love of building, examples of which are the renovation of the Louvre and the erection of the palace of Saint Paul in Paris.

Vuillery, Études sur le régime financier de la France, vols. i. and ii. (1883); and R. Delachenal, Histoire de Charles V (Paris, 1908).
CHARLES VI. (1368-1422), king of France, son of Charles V. and Jeanne of Bourbon, was born in Paris on the 3rd of December 1368. He received the appanage of Dauphiné at his birth, and was thus the first of the princes of France to bear the title of dauphin from infancy. Charles V. had entrusted his education to Philippe de Mézières, and had fixed his majority at fourteen. He succeeded to the throne in 1380, at the age of twelve, and the royal authority was divided between his paternal uncles, Louis, duke of Anjou, John, duke of Berry, Philip the Bold, duke of Burgundy, and his mother's brother, Louis II., duke of Bourbon. In accordance with an ordinance of the late king the duke of Anjou became regent, while the guardianship of the young king, together with the control of Paris and Normandy, passed to the dukes of Burgundy and Bourbon, who were to be assisted by certain of the councillors of Charles V. The duke of Berry, excluded by this arrangement, was compensated by the government of Languedoc and Guienne. Anjou held the regency for a few months only, until the king's coronation in November 1380. He enriched himself from the estate of Charles V. and by excessive exactations, before he set out in 1382 for Italy to effect the conquest of Naples. Considerable discontent existed in certain parts of France at the time of the death of Charles V., and when the duke of Anjou re-imposed certain taxes which the late king had remitted at the end of his reign, there were revolts at Puy and Montpellier. Paris, Rouen, the cities of Flanders, with Amiens, Orleans, Reims and other French towns, also rose (1382) in revolt against their masters. The Maillotins, as the Parisian insurgents were named from the weapon they used, gained the upper hand in Paris, and were able temporarily to make terms, but the commune of Rouen was abolished, and the Tuchins, as the marauders in Languedoc were called, were pitilessly hunted down. Charles VI. marched to the help of the count of Flanders against the insurgents headed by Philip van Artevelde, and gained a complete victory at Roosebeke (November 27th, 1382). Strengthened by this success the king, on his return to Paris in the following January, exacted vengeance on the citizens by fines, executions and the suppression of the privileges of the city. The help sent by the English to the Flemish cities resulted in a second Flemish campaign. In 1385 Jean de Vienne, who had made an unsuccessful descent on the Scottish coast, and Charles equipped a fleet at Sluys for the invasion of England, but a series of delays ended in the destruction of the ships by the English.

In 1385 Charles VI. married Elizabeth, daughter of Stephen II., duke of Bavaria, her name being gallicized as Isabeau. Three years later, with the help of his brother, Louis of Orleans, duke of Touraine, he threw off the tutelage of his uncles, whom he replaced by Bureau de la Rivièrè and others among his father's counsellors, nicknamed by the royal princes the marmousets because of their humble origin. Two years later he deprived the duke of Berry of the government of Languedoc. The opening years of Charles VI.'s effective rule promised well, but excess in the gaiety of all kinds undermined his constitution, and in 1392 he had an attack of madness at Le Mans, when on his way to Brittany to force John V. the surrender of his cousin Pierre de Craon, who had tried to assassinate the constable Olivier de Clisson in the streets of Paris. Other attacks followed, and it became evident that Charles was unable permanently to sustain the royal authority. Clisson, Bureau de la Rivièrè, Jean de Mercier, and the other marmousets were driven from office, and the royal dukes regained their power. The rivalries between the most powerful of these—the duke of Burgundy, who during the king's attacks of madness practically ruled the country, and the duke of Orleans—were a constant menace to peace. In 1396 peace with England seemed assured by the marriage of Richard II. with Charles V.'s daughter Isabella, but the Lancastrian revolution of 1399 destroyed the diplomatic advantages gained by this union. In France the country was disturbed by the papal schism. At an assembly of the clergy held in Paris in 1398 it was resolved to refuse to recognize the authority of Benedict XIII., who succeeded Clement VII. as schismatic pope at Avignon. The question became a party one; Benedict was supported by Louis of Orleans, while Philip the Bold and the university of Paris opposed him. Obedience to Benedict's authority was resumed in 1403, only to be withdrawn again in 1408, when the king declared himself the guarantor and protector of the French church, which was indeed for a time self-governing. Edicts further extending the royal power in ecclesiastical affairs were even issued in 1418, after the schism was at an end.

The king's intelligence became yearly feebleer, and in 1404 the death of Philip the Bold aggravated the position of affairs. The new duke, John the Fearless, did not immediately replace his father in general affairs, and the influence of the duke of Orleans increased. Queen Isabeau, who had generally supported the Burgundian party, was now practically separated from her husband, whose madness had become pronounced. She was replaced by a young Burgundian lady, Odette de Champdivers, called by her contemporaries la petite reine, who rescued the king from the state of neglect into which he had fallen. Isabeau of Bavaria was freely accused of intrigue with the duke of Orleans. She was from time to time regent of France, and as her policy was marked by capricious considerations and by her love of splendour she further added to the general discontent. The rivalry between John the Fearless and the duke of Orleans became more embittered, and on the 23rd of November 1407 Orleans was murdered in the streets of Paris at the instigation of his rival. The young duke Charles of Orleans married the daughter of the Gascon count Bernard VII. of Armagnac, and presently formed alliances with the dukes of Berry, Bourbon and Brittany, and others who formed the party known as the Armagnacs (see ARMAGNAC), against the Burgundians who had gained the upper hand in the royal council. In 1411 John the Fearless contracted an alliance with Henry IV. of England, and civil war began in the autumn, but in 1412 the Armagnacs in their turn sought English alliance, and, by promising the sovereignty of Aquitaine to the English king, gave John the opportunity of posing as defender of France. In Paris the Burgundians were hand in hand with the corporation of the butchers, who were the leaders of the Parisian populace. The malcontents, who took their name from one of their members, Caboche, penetrated into the palace of the dauphin Louis, and demanded the surrender of the unpopular members of his household. A royal ordinance, promising reforms in administration, was promulgated on the 27th of May 1413, and some of the royal advisers were executed. The king and the dauphin, powerless in the hands of Duke John and the Parisians, appealed secretly to the Armagnac princes for deliverance. They entered Paris in September; the ordinance extracted by the Cabochiens was rescinded; and numbers of the insurgents were banished the city.

In the next year Henry V. of England, after concluding an alliance with Burgundy, resumed the pretensions of Edward III. to the crown of France, and in 1415 followed the disastrous battle of Agincourt. The two elder sons of Charles VI., Louis, duke of Guîenne, and John, duke of Touraine, died in 1415 and 1417, and Charles, count of Ponthieu, became heir apparent. Paris was governed by Bernard of Armagnac, constable of France, who expelled all suspected of Burgundian sympathies and treated Paris like a conquered city. Queen Isabeau was imprisoned at Tours, but escaped to Burgundy. The capture of Paris by the Burgundians on the 20th of May 1418 was followed by a series of horrible massacres of the Armagnacs; and in July Duke John and Isabeau, who assumed the title of regent, entered Paris. Meanwhile Henry V. had completed the conquest of Normandy. The murder of John the Fearless in 1419 under the eyes of the dauphin Charles threw the Burgundians definitely into the arms of the English, and his successor Philip the Good, in concert with Queen Isabeau, concluded (1420) the treaty of Troyes with Henry V., who became master of France. Charles VI. had long been of no account in the government, and the state of neglect in which he existed at Senlis induced Henry V. to undertake the reorganization of his household. He came to Paris in September 1422, and died on the 21st of October.
The chief authorities for the reign of Charles VI. are: — Chronica Caroli VI., written by a monk of Saint Denis, commissioned officially to write the history of his time, edited by C. Bellaguet with a French translation (6 vols., 1839-1852); Jean Juvelard des Ursins, Chronique, printed by D. Godfrin for V. Eyquem de Charivari, Hist. de Charles VI. (1653), chiefly an abridgment of the monk of St. Denis’s narrative; a fragment of the Grandes Chroniques de Saint Denis covering the years 1381 to 1383 (ed. J. Fichon 1864); correspondence of Charles VI. printed by Champion-Figier in Lettres de rois, vol. ii.; Choix des poèmes inédits rel. au règne de Charles VI (2 vols., 1863-1864), edited by L. Douët d’Arcq for the Société de l’Histoire de France; J. Froissart, Chroniques; Enarrand de Monstrelet, Chroniques, covering the first half of the Fourteenth Century, ed. by H. Ronsin for the Bibliothèque des quatre premiers Vaillots, by an unknown author, ed. S. Luce (1862). See also E. Lavisse, Hist. de France, iv. 267 seq.; E. Petit, Œuvres, ii.; J. Douet de la Rue, Hist. de France, 15th cent. (2 vols., 1858-1859); M. Thibaut, Isaac de Bavie (1903).

CHARLES VII. (1403-1461), king of France, fifth son of Charles VI. and Isabeau of Bavaria, was born in Paris on the 22nd of February 1423. The count of Ponthieu, as he was called in his boyhood, was betrothed in 1413 to Mary of Anjou, daughter of Louis II., duke of Anjou and king of Sicily, and spent the next two years at the Angevin court. He received the duchy of Touraine in 1416, and in the next year the death of his brother John made him dauphin of France. He became lieutenant-general of the kingdom in 1417, and made active efforts to combat the complaisance of his mother. He assumed the title of regent in December 1418, but his authority in northern France was paralysed in 1419 by the murder of John the Fearless, duke of Burgundy, in his presence at Montereau. Although the deed was not apparently premeditated, as the English and Burgundians declared, it ruined Charles’s cause for the time. He was disinherited by the treaty of Troyes in 1420, and at the time of his father’s death in 1422 had retained to Meunor-sur-Yèvre, near Bourges, which had been the nominal seat of government since 1418. He was recognized as king in Touraine, Berry and Poitou, and Louis XI., who had been paralysed by the loss of all the other parts of France, but the English power in the north was presently increased by the provinces of Champagne and Maine, as the result of the victories of Crevant (1423) and Verneuil (1424). The Armagnac administrators who had been driven out of Paris by the duke of Bedford gathered round the young king, nicknamed the “king of Bourges,” but he was weak in body and mind, and was under the domination of Jean Levet and Tanguy de Chastel, the instigators of the murder of John the Fearless, and other discredited partisans. The power of these favourites was shaken by the influence of the queen’s mother, Yolande of Aragon, Duchess of Anjou. She sought the alliance of John V., Duke of Brittany, who, however, vacillated throughout his life between the English and French alliance, concerned chiefly to maintain the independence of his duchy. His brother, Arthur of Brittany, earl of Richmond (comte de Richemont), was reconciled with the king, and became constable in 1425, with the avowed intention of making peace between Charles VII. and the duke of Burgundy. Richemont caused the assassination of Charles’s favourites Pierre de Gicq and Le Camus de Beaulieu, and imposed one of his own choosing, Georges de la Trémoïlle, an adventurer who rapidly usurped the constable’s power. For five years (1427-1432) a private war between these two exhausted the Armagnac forces, and central France returned to anarchy.

Meanwhile Bedford had established settled government throughout the north of France, and in 1428 he advanced to the siege of Orleans. For the movement which was to lead to the deliverance of France from the English invaders, see JOAN OF ARC. The siege of Orleans was raised by his efforts on the 8th of May 1429, and two months later Charles VII. was crowned at Reims. Charles’s intimate counsellors, La Trémoïlle and Regnault de Chartres, archbishop of Reims, saw their fortunes menaced by the triumphs of Joan of Arc, and accordingly the constable, who was then in the height of his military career, and received the news of her capture before Compiègne (1430) with indifference. No measures were taken for her deliverance or her ransom, and Normandy and the Isle of France remained in English hands. Fifteen years of anarchy and civil war intervened before peace was restored. Bands of armed men fighting for their own hand traversed the country, and in the ten years between 1434 and 1444 the provinces were invaded by these échevres, who, with the decline of discipline in the English army, were also recruited from the ranks of the invaders. The Duke of Bedford died in 1435, and in the same year Philip the Good of Burgundy concluded a treaty with Charles VII. at Arras, after fruitless negotiations for an English treaty. From this time Charles’s policy was strengthened. La Trémoïlle had been assassinated in 1433 by the constable’s orders, with the connivance of Yolande of Aragon. For his former favourites were substituted energetic advisers, his brother-in-law Charles of Anjou, Dunois (the famous bastard of Orleans), Pierre de Brézé, Richemont and others. Richemont entered Paris on the 13th of April 1436, and in the next five years the finance of the country was re-established on a settled basis. Charles himself commanded the troops who captured Pontoise in 1441, and in the next year he made a successful expedition in the south.

Meanwhile the princes of the blood and the great nobles presented the ascendency of councillors and soldiers drawn from the smaller nobility and the bourgeoisie. They made a formidable league against the crown in 1449 which included Charles I., Duke of Bourbon, John III., Duke of Alençon, John IV. of Armagnac, and the dauphin, afterwards Louis XI. The revolt broke out in Poitou in 1440 and was known as the Praguerie. Charles VII. repressed the rising, and showed great skill with the rebel nobles, finally buying them over individually by considerable concessions. In 1444 a truce was concluded with England at Tours, and Charles proceeded to organize a regular army. The central authority was gradually made effective, and a definite system of payment, by removing the original cause of brigandage, and the establishment of a strict discipline learnt perhaps from the English troops, gradually stamped out the most serious of the many evils under which the country had suffered. Pierre Bessonau, and the brothers Gaspard and Jean Bureau created a considerable force of artillery. Domestic troubles in their own country prevented the English in France. The conquest of Normandy was completed by the battle of Formigny (15th of April 1450). Guenin was conquered in 1451 by Dunois, but not subdued, and another expedition was necessary in 1453, when Talbot was defeated and slain at Castillon. Meanwhile in 1450 Charles VII. had resolved on the rehabilitation of Joan of Arc, thus rendering a tardy recognition of her services. This was granted in 1456 by the Holy See. The only foothold retained by the English on French ground was Calais. In its earlier stages the deliverance of France from the English had been the work of the people themselves. The change which made Charles take an active part in public affairs is said to have been largely due to the influence of Agnes Sorel, who became his mistress in 1444 and died in 1450. She was the first to play a public and political rôle as mistress of a king of France, and may be said to have established a tradition. Pierre de Brézé, who had had a large share in the organization of the Praguerie, obtained through her a dominating influence over the king, and inspired the monarch himself and the whole administration with her. Charles and René of Anjou retired from court, and the greater part of the members of the king’s council were drawn from the bourgeois classes. The most famous of all these was Jacques Cœur (q.v.). It was by the zeal of these councillors that Charles obtained the surname of “The Well-Served.”

Charles VII. continued his father’s general policy in church matters. He desired to lessen the power of the Holy See in France and to preserve as far as possible the liberties of the Gallican church. With the council of Constance (1414-1418) the great schism was practically healed. Charles, while careful to protest against his renewal, supported the anti-papal contentions of the French members of the council of Basel (1431-1449), and in 1438 he promulgated the Pragmatic Sanction at Bourges, by which the patronage of ecclesiastical benefices was removed from the Holy See, while certain interventions of the royal power were admitted. Bishops and abbots were to be elected, in accordance with ancient custom, by their clergy.
After the English had evacuated French territory Charles still had to cope with feudal revolt, and with the hostility of the dauphin, who was in open revolt in 1446, and for the next ten years ruled like an independent sovereign in Dauphiné. He took refuge in 1457 with Charles's most formidable enemy, Philip of Burgundy. Charles VII. nevertheless found means to prevent Philip from attaining his ambitions in Lorraine and in Germany. But the dauphin succeeded in embarrassing his father's policy at home and abroad, and had won his own party in the court itself. Charles VII. died at Mehun-sur-Yèvre on the 22nd of July 1461. He believed that he was poisoned by his son, who cannot, however, be accused of anything more than an eager expectation of his death.

AUTHORITIES.—The history of the reign of Charles VII. has been written by many modern historians.—Vallet de Virville. Histoire de Charles VII. . . . et de son époque (Paris, 1862-1865), and G. du Fresne de Beaucourt, Histoire de Charles VII. (Paris, 6 vols., 1881-1891). There is abundant contemporary material. The herald, Jacques le Bouvier or Berry (b. 1386), whose Chroniques du feu roi Charles VII was first printed in 1528 as the work of Alain Chartrier, was an eye-witness of many of the events he described. His Recueuils de Normandie, with other material on the same subject, was edited for the Roule series (Chronicles and Memoir, ed. by Joseph Stevenson in 1863. The Histoire de Charles VII. by Jean Chartrier, historiographer-general from 1437, was included in the Grandes Chroniques de Saint-Étienne. his chronicle, la doué d'Anjou (1494-1574), was published in 1444 and 1445. The same author re-edited the 1863. His account was reprinted in 1574. It was then, at the age of twenty, he had the appearance of an old man, and night and day he was haunted with nightmares. He died on the 30th of May 1574. By his mistresses, Marie Touchet, he had one son, Charles, duke of Angoulême. Charles IX. had a sincere love of letters, himself practised poetry, was the patron of Ronsard and the poets of the Pleiad, and granted privileges to the first academy founded by Antoine de Baïf (Paris, 1625, and reprinted in 1859.

AUTHORITIES.—The principal sources are the contemporary memoirs and chronicles of T. d'Aubigné, Brantôme, Castelnaud, Hanon, the Place, Monluc, de Noire, l'Estoile, Ste Foy, de Thou, Tavannes, A. Olivier, aide de camp to Henry IV. de Castelnaud, and the published correspondence of Catherine de Médici, Marguerite de Valois, and the Venetian ambassadors; and Calendars of State Papers, &c. See also Abel Desjardins, Charles IX, deux années de règne (Paris, 1754), and La Réforme. The XVI. et les Valois (Paris, 1799); H. Mariebou, La Réforme et la Ligue (Paris, 1863), in vol. v. of the Histoire de France, by E. Lavisse, which contains a bibliography for the reign.

CHARLES VIII. (1470-1482), king of France, was the only son of Charles. During the whole of his childhood Charles lived far from his father at the château d'Amboise, which was throughout his life his favourite residence. On the death of Louis XI. in 1483 Charles, a lad of thirteen, of age, but was absolutely incapable of governing. Until 1492 he abandoned the government to his sister Anne of Beaujeu. In 1497 he married Anne, duchess of Brittany, who was already betrothed to Maximilian of Austria. Urged by his favourite, Étienne de Vesc, he then, at the age of twenty-two, threw off the yoke of the Beaujeu, and at the same time divided their wise and able policy. But he was a thorough worthless man with a weak and ill-balanced intellect. He had a romantic imagination and conceived vast projects. He proposed at first to claim the rights of the house of Anjou, to which Louis XI. had succeeded, on the kingdom of Naples, and to use this as a stepping-stone to the capture of Constantinople from the Turks and his own coronation as emperor of the East. He sacrificed everything to this adventurous policy, signed disastrous treaties to keep his hands free, and set out for Italy in 1494. The ceremonial side of the expedition being in his eyes the most important, he allowed himself to be intoxicated by his easy triumph and doped by the Italians. On the 12th of May 1495 he entered Naples in great pomp, clothed in the imperial insignia. A general coalition was, however, formed against him, and he was forced to return precipitately to France. It cannot be denied that he had showed bravery at the battle of Fornovo (the 3rd of July 1495). He was preparing a fresh expedition to Italy, when he died on the 8th of April 1498, from the results of an accident, at the château of Amboise.

CHARLES IX. (1550-1574), king of France, was the third son of Henry II. and Catherine de’Medici. At first he bore the title of duke of Orleans. He became king in 1560 by the death of his brother Francis II., but as he was only ten years old the power was in the hands of the queen-mother, Catherine. Charles seems to have been a youth of good parts, lively and agreeable, but he had a weak, passionate and fantastic nature. His education had spoiled him. He was left to his whims—ever the strangest—and to his taste for violent exercises; and the excesses to which he gave himself ruined his health. Proclaimed of age on the 17th of August 1563, he continued to be absorbed in his fantasies and his hunting, and submitted docilely to the authority of his mother. In 1570 he was married to Elizabeth of Austria, daughter of Maximilian II. It was about this time that he dreamed of making a figure in the world. The successes of his brother, the duke of Anjou, at Jarnac and Moncontour had already caused him some jealousy. When Coligny came to court, he received him very warmly, and seemed at first to accept the idea of an intervention in the Netherlands against the Spaniards. For the upshot of this adventure see the article ST BARTHOLOMEW, MASSACRE OF. Charles was in these circumstances no hypocrite, but weak, hesitating and ill-balanced. Moreover, the terrible events in which he had played a part transformed his character. He became melancholy, severe and taciturn. "It is feared," said the Venetian ambassador, "that he may become cruel." Undermined by fear, at the age of twenty he had the appearance of an old man, and night and day he was haunted with nightmares. He died on the 30th of May 1574. By his mistresses, Marie Touchet, he had one son, Charles, duke of Angoulême. Charles IX. had a sincere love of letters, himself practised poetry, was the patron of Ronsard and the poets of the Pleiad, and granted privileges to the first academy founded by Antoine de Baïf (Paris, 1625, and reprinted in 1859.)
ceremonial of the old régime, proclaimed his intention of ruling, as the Most Christian King, by divine right. His first acts, indeed, alloyed the worst alarms of the Liberals; but it was soon apparent that the weight of the crown would be consistently thrown into the scale of the reactionary forces. The émigrés were awarded a milliard as compensation for their confiscated lands; and Gallicans and Liberals alike were offended by measures which threw increased power into the hands of the Jesuits and Ultramontanes. In a few months there were disquieting signs of the growing unpopularity of the king. The royal princesses were insulted in the streets; and on the 29th of April 1825 Charles, when reviewing the National Guard, was met with cries from the ranks of "Down with the ministers!" His reply was, next day, a decree disbanning the citizen army.

It was not till 1829, when the result of the elections had proved the futility of Villé's policy of repression, that Charles consented unwillingly to try a policy of compromise. It was, however, too late. Villé's successor was the vicomte de Martignac, who took Decazes for his model; and in the speech from the throne Charles declared that the happiness of France depended on "the sincere union of the royal authority with the liberties consecrated by the charter." But Charles had none of the patience and common-sense which had enabled Louis XVIII. to play with decency the part of a constitutional king. "I would rather hew wood," he exclaimed, "than be a king under the conditions of the king of England;" and when the Liberal opposition obstructed all the measures proposed by a ministry not selected from the parliamentary majority, he lost patience. "I told you," he said, "that there was no coming to terms with these men." Martignac was dismissed; and Prince Jules de Polignac, the very incarnation of clericalism and reaction, was called to the helm of state.

The inevitable result was obvious to all the world. "There is nothing in this political experience," wrote Wellington, "certainly no friend of Liberalism;" "with the warning of Janets II. before him, Charles X. was setting up a government by priests, through priests, for priests." A formidable agitation sprang up in France, which only served to make the king more obdurate. In opening the session of 1830 he declared that he would "find the power" to overcome the obstacles placed in his path by "culpable manoeuvres." The reply of the chambers was a protest against "the unjust distress of the sentiment and reason of France"; whereupon they were first prorogued, and on the 15th of May dissolved. The result of the new elections was what might have been foreseen: a large increase in the Opposition; and Charles, on the advice of his ministers, determined on a virtual suspension of the constitution. On the 25th of July were issued the famous "four ordinances" which were the immediate cause of the revolution that followed.

With singular fatuity Charles had taken no precautions in view of a new insurrection. The palace and the scattered troops in Paris, had received no orders, beyond a jesting command from the duke of Angoulême to place them under arms "as some windows might be broken." At the beginning of the revolution Charles was at St Cloud, whence on the news of the fighting he withdrew first to Versailles and then to Rambouillet. So little did he understand the seriousness of the situation that, when the laconic message "All is over!" was brought to him, he believed that the insurrection had been suppressed. On realizing the truth he hastily abdicated in favour of his grandson, the duke of Bordeaux (comte de Chambord), and appointed Louis Philippe, duke of Orléans, lieutenant-general of the kingdom (July 30th). But, on the news of Louis Philippe's acceptance of the crown, he gave up the contest and began a dignified retreat to the sea-coast, followed by his suite, and surrounded by the infantry, cavalry and artillery of the guard. Beyond sword-smashing observation to follow his movements, the new government did nothing to arrest his escape. At Maintenon Charles took leave of the bulk of his troops, and proceeding with an escort of some 1200 men to Cherbourg, took ship there for England on the 16th of August. For a time he returned to Holyrood Palace at Edinburgh, which was again placed at his disposal. He died at Goritz, whither he had gone for his health, on the 6th of November 1836.

The best that can be said of Charles X. is, that if he did not know how to rule, he knew how to cease to rule. The dignity of his exit was more worthy of the ancient splendour of the royal house of France than the theatrical humility of Louis Philippe's entrance. But Charles was an impossible monarch for the 19th century, or perhaps for any other century. He was a typical Bourbon, unable either to learn or to forget; and the closing years of his life he spent in religious austerities, intended to expiate, not his failure to grasp a great opportunity, but the comparatively venal excesses of his youth.¹

CHARLES I. (1288-1342), king of Hungary, the son of Charles Martell, and Clementia, daughter of the emperor Rudolph, was known as Stephen of Hungary, the last of the House of Anjou and the first of the Royal House of Hungary, a dynasty which produced seven kings of Hungary. Stephen was born at Paris on 5th February 1288, and on 13th February 1290 he was crowned king of Hungary, being enthroned at Esztergom after the death of the last Arpád, Andrew III. (1301), but was forced the same year to surrender the crown to Wenceslaus II. of Bohemia (1289-1306). His failure only made Pope Boniface VIII. still more zealous on his behalf, and at the diet of Pressburg (1304) his Magyar adherents induced him to attempt to recover the crown of Stephen from the Czechs. But in the meantime (1305) Wenceslaus transferred his rights to Duke Otto of Bavaria, who in his turn was taken prisoner by the Hungarian rebels. Charles's prospects now improved, and he was enthroned at Buda on the 15th of June 1309, though his installation was not regarded as valid till he was crowned with the sacred crown (which was at last recovered from the robber-baron) at Székesfehérvár on the 27th of July. For the next three years Charles had to contend with rebellion after rebellion, and it was only after his great victory over all the elements of rapine and disorder at Rozgony (June 15, 1312) that he was really master in his own land. His foreign policy aimed at the aggrandizement of his family, but his plans were prudent as well as ambitious, and Hungary benefited by them greatly. His most successful achievement was the union with Poland for mutual defence against the Habsburgs and the Czechs. This was accomplished by the convention of Trenčín (1335), confirmed the same year at the brilliant congress of Visegrád, where all the princes of central Europe met to compose their differences and were splendidly entertained during the months of October and November. The immediate result of the congress was a combined attack by the Magyars and Poles upon the emperor Louis and his ally, Albert of Austria, which resulted in favour of Charles (1337). Charles V. united the kingdoms of Hungary and Naples under the eldest son Louis, who was ailing, upon a visit to Venice and the pope, from fear lest Hungary might become the dominant

¹ This, at any rate, represents the general verdict of history. It is interesting, however, to note that so liberal-minded and shrewd a critic of men as King Leopold I. of the Belgians formed a different estimate. In a letter of the 18th of November 1836 addressed to Prince Charles (afterwards Queen) Victoria he writes: "History will state that Louis XIV. was a most unwise monarch, reigning with great mildness and justice to his end, but that his brother, from his despotic and harsh disposition, upset all the other had done, and lost France. Louis XVIII. was a clever, hard-hearted man, shackled by no principle, very proud and false. Charles X. an honest man, a kind friend, an honourable master, sincere in his opinions, and inclined to do everything that is right. That teaches us what we ought to believe in history as it is compiled according to ostensible events and results is known to the generality of people."
Adriatic power. He was, however, more than compensated for this disappointment by his compact (1339) with his ally and brother-in-law, Casimir of Poland, whereby it was agreed that Louis should succeed to the Polish throne on the death of the childless Casimir. For an account of the numerous important reforms effected by Charles see HUNGARY: History. A statesman of the first rank, he not only raised Hungary once more to the rank of a great power, but enriched and civilized her. In character he was pious, courtly and valiant, popular alike with the nobility and the middle classes, whose increasing welfare he did so much to promote, and much beloved by the clergy. His court was famous throughout Europe as a school of chivalry. Charles was married thrice. His first wife was Maria, daughter of Duke Casimir of Teschen, whom he wedded in 1306. On her death in 1318 he married Beatrice, daughter of the emperor Henry VII. On her decease two years later he gave his hand to Elizabeth, daughter of Wladislaus Lokietek, king of Poland. Five sons were the fruit of these marriages, of whom three, Louis, Andrew and Stephen, survived him. He died on the 16th of July 1342, and was laid beside the high altar at Székesfehérvár, the ancient burial-place of the Arpads.

See Béla Kerékgyártó, The Hungarian Royal Court under the House of Anjou (Hung.) (Budapest, 1881); Rationes Collectorum Pontificum, in Hungary (Budapest, 1887); Diplomas of the Angevin Period, edited by Imre Nagy (Hung. and Lat.), vols. I.-iii. (Budapest, 1879, &c.). (R. N. B.)

CHARLES I. (1226-1285), king of Naples and Sicily and count of Anjou, was the seventh child of Louis VIII. of France and Blanche of Castile. Louis died a few months after Charles's birth and was succeeded by his son Louis IX. (St. Louis), and on the death in 1232 of the third son John, count of Anjou and Maine, those feuds were conferred on Charles. In 1246 he married Beatrice, daughter and heiress of Raymond Bérenger V., the last count of Provence, and after defeating James I. of Aragon and other rivals with the help of his brother the French king, he took possession of his new county. In 1248 he accompanied Louis in the crusade to Egypt, but on the defeat of the Crusaders he was taken prisoner with his brother. Shortly afterwards he was ransomed, and returned to Provence in 1250. During his absence several towns had asserted their independence; but he succeeded in subduing them without much difficulty and gradually suppressed their communal liberties. Charles's ambition aimed at wider fields, and when Margaret, countess of Flanders, asked help of the French court against the German king William of Holland, by whom she had been defeated, he gladly accepted her offer of the county of Hainaut in exchange for his assistance (1253); this arrangement was, however, rescinded by Louis of France, who returned from captivity in 1254, and Charles gave up Hainaut for an immense sum of money. He extended his influence by the subjugation of Marcellas in 1257, then one of the most important maritime cities of the world, and two years later several communes of Piedmont recognized Charles's suzerainty. In 1262 Pope Urban IV. determined to destroy the power of the Hohenstaufen in Italy, and offered the kingdoms of Naples and Sicily, in consideration of a yearly tribute, to Charles of Anjou, in opposition to Manfred, the bastard son of the late emperor Frederick II. The next year Charles succeeded in getting himself elected senator of Rome, which gave him an advantage in dealing with the pope. After long negotiations he accepted the Sicilian and Neapolitan crowns, and in 1264 he sent a first expedition of Provençals to Italy; he also collected a large army and navy in Provence and France with the help of King Louis, and by an alliance with the cities of Lombardy was able to send part of his force overland. Pope Clement IV. confirmed the Sicilian agreement on conditions even more favourable to Charles, who sailed in 1265, and conferred on the expedition all the privileges of a crusade. After narrowly escaping capture by Manfred's fleet he reached Rome safely, where he was crowned king of the Two Sicilies. The land army arrived soon afterwards, and on the 26th of February 1266 Charles encountered Manfred at Benevento, where after a hard-fought battle Manfred was defeated and killed, and the whole kingdom was soon in Charles's possession. Then Conradin, Frederick's grandson and last legitimate descendant of the Hohenstaufen, came into Italy, where he found many partisans among the Ghibellines of Lombardy and Tuscany, and among Manfred's former adherents in the south. He gathered a large army consisting partly of Germans and Saracens, but was totally defeated by Charles at Tagliacozzo (23rd of August 1268); taken prisoner, he was tried as a rebel and executed at Naples. Charles, in a spirit of the most vindictive cruelty, had large numbers of Conradin's barons put to death and their estates confiscated, and the whole population of several towns massacred.

He was now one of the most powerful sovereigns of Europe, for besides ruling over Provence and Anjou and the kingdom of the Two Sicilies, he was imperial vicar of Tuscany, lord of many cities of Lombardy and Piedmont, and as the pope's favourite practically arbiter of the papal states, especially during the interregnum between the death of Clement IV. (1268) and the election of Gregory X. (1271). But his ambition was by no means satisfied, and he even aspired to the crown of the East Roman empire. In 1272 he took part with Louis IX. in a crusade to north Africa, where the French king died, and he, and Charles, after defeating the soldier of Tunis, returned to Sicily. The election of Rudolph of Habsburg as German king after a long interregnum, and that of Nicholas III. to the Holy See (1277), diminished Charles's power, for the new pope set himself to compose the difference between Guelphs and Ghibellines in the Italian cities, but at his death Charles secured the election of his kinsman Martin IV. (1281), who recommenced persecuting the Ghibellines, excommunicated the Greek emperor, Michael Palæologus, proclaimed a crusade against the Greeks, filled every appointment in the papal states with Charles's vassals, and reappointed the Angevin king senator of Rome.

But the cruelty of the French rulers of Sicily drove the people of the island to despair, and a Neapolitan nobleman, Giovanni da Procida, organized the rebellion known as the Sicilian Vespers (see VESPERS, SICILIAN), in which the French in Sicily were all massacred or expelled (1282). Charles determined to subjugate the island and sailed with his fleet for Messina. The city held out until Peter III. of Aragon, whose wife Constance was a daughter of Manfred, arrived in Sicily, and a Sicilian-Catalan fleet under the Calabrese admiral, Ruggiero di Lauria, completely destroyed that of Charles. “If thou art determined, O God, to destroy me,” the unhappy Angevin exclaimed, “let my fall be gradual!” He was forced to abandon all attempts at reconquest, but proposed to decide the question by single combat between himself and Peter, to take place at Bordeaux under English protection. The Aragonese accepted, but fearing treachery, as the French army was in the neighbourhood, he failed to appear on the appointed day. In the meanwhile Ruggiero di Lauria appeared before Naples and destroyed another Angevin fleet commanded by Charles's son, who was taken prisoner (May 1284). Charles came to Naples with a new fleet from Provence, and was preparing to invade Sicily again, when he contracted a fever and died at Foggia on the 7th of January 1285. He died as a unhappy man, but was a noble soldier and a skilful statesman, and much of his legislation had a real political sense; but his inordinate ambition, his oppressive methods of government and taxation, and his cruelly created enemies on all sides, and led to the collapse of the edifice of dominion which he had raised.

CHARLES II. (1290-1309), king of Naples and Sicily, son of Charles I., had been captured by Ruggiero di Lauria in the naval battle at Naples in 1284, and when his father died he was still a prisoner in the hands of Peter of Aragon. In 1288 King Edward I. of England had mediated to make peace, and Charles was liberated on the understanding that he was to retain Naples alone, Sicily being left to the Aragonese; Charles was also to induce his cousin Charles of Valois to renounce for twenty thousand pounds of silver the kingdom of Aragon which had been given to him by Pope Martin IV. to punish Peter for having invaded Sicily, but which the Valois had never effectively occupied. The Angevin king was therefore set free, leaving
three of his sons and sixty Provençal nobles as hostages, promising to pay 30,000 marks and to return a prisoner if the conditions were not fulfilled within three years. He went to Rieti, where the new pope Nicholas IV. immediately absolved him from all the conditions he had sworn to observe, crowned him king of the Two Sicilies (1286), and excommunicated Alphonso, while Charles of Valois, in alliance with Castile, prepared to take possession of Aragon. Alphonso III, the Aragonese king, being hard pressed, had to promise to withdraw the troops he had sent to help his brother James in Sicily, to renounce all rights over the island, and pay a tribute to the Holy See. But Alphonso died childless in 1291 before the treaty could be carried out, and James took possession of Aragon, leaving the government of Sicily to the third brother Frederick. The new pope Boniface VIII., elected in 1294 at Naples under the auspices of King Charles, meditated between the latter and James, and a most dishonourable treaty was signed: James was to marry Charles's daughter Bianca and was promised the investiture by the pope of Sardinia and Corsica, while he was to leave the Angevin a free hand in Sicily and even to assist him if the Sicilians resisted. An attempt was made to bribe Frederick into consenting to this arrangement, but being backed up by his people he refused, and was afterwards crowned king of Sicily. The war was fought with great fury on land and sea, but Charles, although aided by the pope, by Charles of Valois, and by James II. of Aragon, was unable to conquer the island, and his son the prince of Taranto was taken prisoner at the battle of La Falconara in 1299. Peace was at last made in 1302 at Caltabellotta, Charles II. giving up all rights to Sicily and agreeing to the marriage of his daughter Leonora to King Frederick; the treaty was ratified by the pope in 1303. Charles spent his last years quietly in Naples, which city he improved and embellished. He died in August 1309, and was succeeded by his son Robert.

BIBLIOGRAPHY.—A. de Saint-Priest, Histoire de la conquête de Naples, Paris, 1840; S. von den, vol. i. of his Histoire des républiques italiennes (Brussels, 1836), gives a good general sketch of the reigns of Charles I. and II., but is occasionally inaccurate as to details; the best authority on the early life of Charles I. is R. Sternfeld, Karl von Anjou als Graf von Provence (Berlin, 1888); Charles's connexion with north Italy is dealt with in M. de Poésy, Charles d'Angleterre et Carlo d'Angiò (Turin, 1891), while the R. Deputazione di Storia Patria Toscana has recently published a Codice diplomatico delle relazioni di Carlo d'Angiò con la Toscana; the contents of the Angevin archives at Naples are published by Durrieu, the four volumes being augmented by an additional volume (Toulouse, 1866-1867). M. Amari's La Guerra del Vespri Siciliano (8th ed., Florence, 1876) is a valuable history, but the author is too bitterly prejudiced against the French to be quite impartial; his work is well complemented by L. cas's (Paris, 1891), Bibliothèque princière de la Bibliothèque du Roi, which contains many documents, and tends somewhat to rehabilitate the Angevin rule.

CHARLES II. (1352-1387), called The Bad, king of Navarre and count of Evreux, was a son of Jeanne II., queen of Navarre, by her marriage with Charles II., king of Castile. Seizing on Jeanne's death, he was pressed a rising at Pamplona with much cruelty, and by this and similar actions thoroughly earned his surname of "The Bad." In 1352 he married Jeanne (d. 1363), a daughter of John II., king of France, a union which made his relationship to the French crown still more complicated. Through his mother he was a grandson of Louis X. and through his father a great-grandson of Philip III., having thus a better claim to the throne of France than Edward III. of England; and, moreover, he held lands under the suzerainty of the French king, whose son-in-law he now became. Charles was a man of great ability, possessing popular manners and considerate eloquence, but he was singularly unscrupulous, a quality which was revealed during the years in which he played an important part in the internal affairs of France. Trouble soon arose between King John and his son-in-law. The promised dowry had not been paid, and the county of Angoulême, which had formerly belonged to Jeanne of Navarre, was now in the possession of the French king's favourite, the constable Charles la Cerda. In January 1354 the constable was assassinated by order of Charles, and preparations for war were begun. The king of Navarre, who defended this deed, had, however, many friends in France and was in communication with Edward III.; and consequently John was forced to make a treaty at Mantes and to compensate him for the loss of Angoulême by a large grant of lands, chiefly in Normandy. This peace did not last long, and in 1355 John was compelled to confirm the treaty of Mantes. Returning to Normandy, Charles was partly responsible for some unrest in the duchy, and in April 1356 he was treacherously seized by the French king at Rouen, remaining in captivity until November 1357, when John, after his defeat at Poitiers, was a prisoner in England. Charles was regarded with much favour in France, and the states-general demanded his release, which, however, was effected by a surprise. Owing to his popularity he was considered by Étienne Marcel and his party as a suitable rival to the dauphin, afterwards King Charles V., and on entering Paris he was well received and delivered an eloquent harangue to the Parisians. Subsequently peace was made with the dauphin, who promised to restore to Charles his confiscated estates. This peace was not enduring, and as his lands were not given back Charles had some ground for complaint. War again broke out, quickly followed by a new treaty, after which the king of Navarre took part in suppressing the peasant rising known as the Jacquerie. Answering the entreaties of Marcel he returned to Paris on June 1358, and became captain-general of the city, which was soon besieged by the dauphin. This position, however, did not prevent him from negotiating both with the dauphin and with the English; terms were soon arranged with the former, and Charles, having lost much of his popularity, left Paris just before the murder of Marcel in July 1358. He continued his alternate policy of war and peace, meanwhile adding if possible by his depreda tions to the misery of France, until the conclusion of the treaty of Brétigny in May 1360 deprived him of the alliance of the English, and compelled him to make peace with King John in the following October. A new cause of trouble arose when the duchy of Burgundy was left without a ruler in November 1361, and was claimed by Charles; but, lacking both allies and money, he was unable to prevent the French king from seizing Burgundy, while he himself returned to Navarre.

In his own kingdom Charles took some steps to reform the financial and judicial administration and so to increase his revenue; but he was soon occupied once more with foreign entanglements, and in July 1362, in alliance with Peter the Cruel, king of Castile, he invaded Aragon, deserting his new ally soon afterwards for Peter IV., king of Aragon. Meanwhile the war with the dauphin had been renewed. Still hankering after Burgundy, Charles saw his French estates again seized; but after some desultory warfare, chiefly in Normandy, peace was made in March 1365, and he returned to his work of interference in the politics of the Spanish kingdoms. In turn he made treaties with the kings of Castile and Aragon, who were at war with each other; promising to assist Peter the Cruel to regain his throne, from which he had been deposed in 1356 by his illegitimate brother Henry of Trastámara, and then assuming the deposed king of Aragon that he would aid him to retain Castile. He continued this treacherous policy when Edward the Black Prince advanced to succour Peter the Cruel; then signed a treaty with Edward of England, and then in 1371 allied himself with Charles V. of France. His next important move was to offer his assistance to Richard II. of England for an attack upon France. About this time serious charges were brought against him. Accused of attempting to poison the king of France and other prominent persons, and of other crimes, his French estates were seized by order of Charles V., and soon afterwards Navarre was invaded by the Castilians. Won over by the surrender of Cherbourg in July 1378, the English under John of Gaunt, duke of Lancaster, came to his aid; but a heavy price had to be paid for the neutrality of the king of Castile. After the death of Charles V. in 1380, the king of Navarre did not interfere in the internal affairs of France, although he endeavoured vainly again to obtain aid from Richard II., and to regain Cherbourg. His lands in France were handed
over to his eldest son, Charles, who governed them with the consent of the new king Charles VI. Charles died on the 1st of January 1387, and many stories are current regarding the manner of his death. Froissart relates that he was burned to death through his bedclothes catching fire; Secouss e says that he died in peace with many signs of contrition; another story says he died of leprosy; and a popular legend tells how he expired by a divine judgment through the burning of the clothes steeped in sulphur and spirits in which he had been wrapped as a cure for a loathsome disease caused by his debauchery. He had three sons and four daughters, and was succeeded by his eldest son Charles; one of his daughters, Jeanne, became the wife of Henry IV. of England.

Charles III. (1361-1425), called THE NOBLE, king of Navarre and count of Evreux, was the eldest son of Charles II. the Bad, king of Navarre, by his marriage with Jeanne, daughter of John II., king of France, and was married in 1375 to Leonora (d. 1415), daughter of Henry II., king of Castile. Having passed much of his early life in France, he became king of Navarre on the death of Charles II. in January 1387, and his reign was a period of peace and order, thus contrasting sharply with the long and calamitous reign of his father. In 1393 he regained Cherbourg, which had been handed over by Charles II. to Richard II. of England, and in 1403 he came to an arrangement with the representatives of Charles VI. of France concerning the extensive lands which he claimed in that country. Cherbourg was given to the French king; certain exchanges of land were made; and in the following year Charles III. surrendered the county of Evreux, and created duke of Nemours and made a peer of France. After this his only interference in the internal affairs of France was when he sought to make peace between the rival factions in that country. Charles sought to improve the condition of Navarre by making canals and rendering the rivers navigable, and in other ways. He died at Olite on the 8th of September 1425 and was buried at Pamplona. After the death of his two sons in 1402 the king decreed that his kingdom should pass to his daughter Blanche (d. 1441), who took for her second husband John, afterwards John II., king of Aragon; and the cortes of Navarre swore to recognize Charles (q.v.), prince of Viana, her son by this marriage, as king after his mother's death.

Charles (Karl Eitel Zephryn Ludwig; in Rum. Carol), king of Rumania (1839-1914), second son of Prince Karl Anton of Hohenzollern-Sigmaringen, was born on the 20th of April 1839. He was educated at Dresden (1850-1856), and passed the Prussian army in 1857. Entering the Russian army in 1857, he won considerable distinction in the Danish war of 1864, and received instruction in strategy from General von Moltke. He afterwards travelled in France, Italy, Spain and Algeria. He was a captain in the 2nd regiment of Russian Dragon Guards when he was elected kosphodar or prince of Rumania on the 20th of April 1866, after the compulsory abdication of Prince Alexander John Cuza. Regarded at first with distrust by Turkey, Russia and Austria, he succeeded in gaining general recognition in six months; but he had to contend for ten years with fierce party struggles between the Conservatives and the Liberals.

During this period, however, Charles displayed great tact in his dealings with both parties, and kept his country in the path of administrative and economic reform, organizing the army, developing the railways, and establishing commercial relations with foreign powers. The sympathy of Rumania with France in the Russo-Turkish War of 1877, and the consequent interruption of certain commercial undertakings, led to a hostile movement against Prince Charles, which, being fostered by Russia, made him resolve to abdicate; and it was with difficulty that he was persuaded to remain. In the Russo-Turkish War of 1877-78 he joined the Russians before Plevna (q.v.), and being placed in command of the combined Russian and Rumanian forces, forced Osman Pasha to surrender. As a consequence of the prince's vigorous action the independence of Rumania, which had been proclaimed in May 1877, was confirmed by various treaties in 1878, and recognized by Great Britain, France and Germany in 1880. On the 26th of March 1881 he was proclaimed king of Rumania, and, with his consort, was crowned on the 22nd of May following. From that time he pursued a successful career in home and foreign policy, and greatly improved the financial and military position of his country; while his appreciation of the fine arts was shown by his formation of an important collection of paintings of all schools in his palaces at Sinaia and Bucharest. For a detailed account of his reign, see RUMANIA. On the 1st of November 1860 he married Princess Elizabeth (q.v.), a daughter of Prince Hermann von Wied, widely known under her literary name of "Carmen Sylva." As the only child of the marriage, a daughter, died in 1874, the succession was finally settled upon the king's nephew, Prince Ferdinand of Hohenzollern-Sigmaringen, who was created prince of Rumania on the 10th of March 1889, and married, on the 10th of January 1893, Princess Marie, daughter of Alfred, duke of Saxe-Coburg, their children being Prince Carol (b. 1893) and Princess Elizabeth (b. 1894).

Charles II. (1661-1700), king of Spain, known among Spanish kings as "The Desired" and "The Bewitched," was the son of Philip IV. by his second marriage with Maria, daughter of the emperor Ferdinand III., his niece. He was born on the 11th of November 1661, and was the only surviving son of his father's two marriages—a child of old age and disease, in whom a constant intermarriages of the Habsburgs had developed the family type to deformity. His birth was greeted with joy by the Spaniards, who feared the dispute as to the succession which must have ensued if Philip IV. left no male issue. The boy was so feeble that till the age of five or six he was fed only from the breast of a nurse. For years afterwards it was not thought safe to allow him to walk. That he might not be overtaxed he was left entirely uneducated, and his indolence was indulged to such an extent that he was not even expected to be clean. When his brother, the younger Don John of Austria, a natural son of Philip IV., obtained power by exiling the queen mother from court he insisted that at least the king's hair should be combed. Charles made the malicious remark that nothing was safe from Don John—not even vermin. The king was then fifteen, and, according to Spanish law, of age. But he never became a man in body or mind. The personages who ruled in his name arranged a marriage for him with Maria Louisa of Orleans, the French princess, a lively young woman of no sense, died in the stifling atmosphere of the Spanish court, and from the attendance of Spanish doctors. Again his advisers arranged a marriage with Maria Ana of Neuburg. The Bavarian wife stood the strain and survived him. Both marriages were merely political—the first a victory for the French, and the second for the Austrian party. France and Austria were alike preparing for the day when the Spanish succession would have to be fought for. The king was a mere puppet in the hands of each alternately. By natural instinct he hated the French, but there was no room in his nearly imbecile mind for more than childish superstition, insane pride of birth, and an interest in court etiquette. The only touch of manhood was a taste for shooting which he occasionally indulged in the preserves of the Escorial. In his later days he suffered much pain, and was driven wild by the conflict between his wish to transmit his inheritance to "the illustrious house of Austria," his own kin, and the belief instilled in him by the partisans of the French claimant that only the power of Louis XIV. could avert the dismemberment of the empire. A silly fanatic made the discovery that the king was bewitched, and his confessor Frölain Díaz supported the
believe. The king was exiled, and the exorcists of the kingdom were called upon to put stringent questions to the devils they cast out. The Inquisition interfered, and the dying king was driven mad among them. Very near his end he had the lugubrious curiosity to cause the coffins of his embalmed ancestors to be opened at the Escorial. The sight of the body of his first wife, at whom he also insisted on looking, provoked a passion of tears and despair. Under severe pressure from the cardinal archbishop of Toledo, Portocarrero, he finally made a will in favour of Philip, duke of Anjou, grandson of Louis XIV., and died on the 1st of November 1700, after a lifetime of senile decay.

The best picture of Charles II is to be found in Les Mémoires de la cour d’Espagne of the Marquis de Villars (London, 1861), and the Lettres de the Marquise de Villars (Paris, 1868).

CHARLES III. (1716–1788), king of Spain, born on the 20th January 1716, was the first son of the second marriage of Philip V. with Elizabeth Farnese of Parma. It was his good fortune to be sent to rule as duke of Parma by right of his mother at the age of sixteen, and thus came under more intellectual influence than he could have found in Spain. In 1734 he made himself master of Naples and Sicily by arms. Charles had, however, no military instincts, soldiers were uniform, and could with difficulty be persuaded to witness a review. The peremptory action of the British admiral commanding in the Mediterranean at the approach of the War of the Austrian Succession, who forced him to promise to observe neutrality under a threat to bombard Naples, made a deep impression on his mind. It gave him a feeling of hostility to England which in after-times influenced his policy.

As king of the Two Sicilies Charles began there the work of internal reform which he afterwards continued in Spain. Foreign ministers who dealt with him agreed that he had no great natural ability, but he was honestly desirous to do his duty as king, and he showed good judgment in his choice of ministers. The chief minister in Naples, Tanucci, had a considerable influence over him. On the death of his half-brother Ferdinand VI., he became king of Spain, and resigned the Two Sicilies to his third son Ferdinand. As king of Spain his foreign policy was disastrous. His strong family feeling and his detestation of England, made unchecked after the death of his wife, Maria Amelia, daughter of Frederick Augustus II. of Saxony, led him into the Family Compact with France. Spain was entangled in the close of the Seven Years’ War, to her great loss. In 1770 he almost turned into another war over the barren Falkland Islands. In 1779 he, somewhat reluctantly, led to join France and the American insurgents against England, though he well knew that the independence of the English colonies must have a ruinous influence on his own American dominions. For his army he did practically nothing, and for his fleet very little except build fine ships without taking measures to train officers and men.

But his internal government was on the whole beneficial to the country. He began by compelling the people of Madrid to give up emptying their slops out of the windows, and when they objected he said they were like children who cried when their faces were washed. In 1766 his attempt to force the Madrileños to adopt the French dress led to a riot during which he did not display much personal courage. For a long time after it he remained at Aranjuez, leaving the government in the hands of his minister Aranda. All his reforms were not of this formal kind. Charles was a thorough despot of the benevolent order, and had been deeply offended by the real or suspected share of the Jesuits in the riot of 1766. He therefore consented to the expulsion of the order, and was then the main advocate for its suppression. His quarrell with the Jesuits, and the recollection of some disputes with the pope he had had when king of Naples, turned him towards a general policy of restriction of the overgrown power of the church. The number of the idle clergy, and more particularly of the monastic orders, was reduced, and the Inquisition, though not abolished, was rendered torpid. In the meantime much antiquated legislation which tended to restrict trade and industry was abolished; roads, canals and drainage works were carried out. Many of his paternal ventures led to little more than waste of money, or the creation of hotbeds of jobbery. Yet on the whole the country prospered. The result was largely due to the king, who even when he was ill-advised did at least work steadily at his task of government. His example was not without effect on some at least of the nobles. In his domestic life King Charles was regular, and was a considerate master, though he had a somewhat caustic tongue and took a rather cynical view of mankind. He was passionately fond of hunting. During his later years he had some trouble with his eldest son and his daughter-in-law. If Charles had lived to see the beginning of the French Revolution he would probably have been frightened into reaction. As he died on the 14th of December 1788 he left the reputation of a philanthropic and "philosophic" king. In spite of his hostility to the Jesuits, his dislike of friars in general, and his jealousy of the Inquisition, he was a very sincere Roman Catholic, and showed much zeal in endeavouring to persuade the pope to proclaim the Immaculate Conception as a dogma necessary to salvation.

CHARLES IV. (1748–1819). king of Spain, second son of Charles III. and his wife Maria Amelia of Saxony, was born at Portici on the 11th of November 1748, while his father was king of the Two Sicilies. The elder brother was set aside as imbecile and epileptic. Charles had inherited a great frame and immense physical strength from the Saxony line of his mother. When young he was fond of wrestling with the strongest countrymen he could find. In character he was not malignant, but he was intellectually torpid, and of a credulity which almost passes belief. His wife, Maria Luisa of Parma, his first cousin, a thoroughly coarse and vicious woman, ruled him completely, though he was capable of obstinacy at times. During his father’s lifetime he was led by her into court intrigues which aimed at driving the king’s favourite minister, Floridablanca, from office, and replacing him by Aranda, the chief of the “Aragonese” party. After he succeeded to the throne in 1788 his one serious occupation was hunting. Affairs were left to be directed by his wife and her lover Godoy (q.v.). For Godoy the king had an unaffected liking, and the lifelong favour he showed him is almost pathetic. When terrified by the French Revolution he turned to the Inquisition to help him against the party which would have carried the reforming policy of Charles III. much further. But he was too slothful to have more than a passive part in the direction of his own government. He simply obeyed the impulse given him by the queen and Godoy. If he ever knew his wife’s real character he thought it more consistent with his dignity to shut his eyes. For he had a profound belief in his divine right and the sanctity of his person. If he understood that his kingdom was treated as a mere dependence by France, he also thought it due to his “face” to make believe that he was a powerful monarch. Royalty never wore a more silly aspect than in the person of Charles IV., and it is highly credible that he never knew what his wife was, or what was the position of his kingdom. He would tell that his son Ferdinand was appealing to the emperor Napoleon against Godoy, he took the side of the populace.

When the populace rose at Aranjuez in 1808 he abdicated to save the minister. He took refuge in France, and when he and Ferdinand were both prisoners of Napoleon’s, he was with difficulty restrained from assaulting his son. Then he abdicated in favour of Napoleon, handing over his people like a herd of cattle. He accepted a pension from the French emperor and spent the rest of his life between his wife and Godoy. He died at Rome on the 20th of January 1819, probably without having once suspected that he had done anything unbecoming a king by divine right and a gentleman.

See Historia del Reinado de Carlos IV., by General Gomez de Arteche (3 vols.), in the Historia General de España de la Real Academia de la Historia (Madrid, 1892, &c.).
CHARLES IX. (1550–1611), king of Sweden, was the youngest son of Gustavus Vasa and Margareta Lejonhultrud. By his father's will he was appointed, by way of appanage, the duchy of Södermanland, which included the provinces of Neriké and Varmland; but he did not come into actual possession of them till after the fall of Eric XIV. (1566). In 1568 he was the real leader of the rebellion against Eric, but took no part in the designs of his brother John against the unhappy king after his deposition. Indeed, Charles's relations with John III. were always more or less strained. He had no sympathy with John's high-church tendencies on the one hand, and he sturdily resisted all the king's endeavours to restrict his authority as duke of Södermanland (Sudermania) on the other. The nobility and the majority of the Riksdag supported John, however, in his endeavours to unify the realm, and Charles had consequently (1587) to resign his pretensions to autonomy within his duchy; but, fanatical Calvinist as he was, on the religious question he was immovable. The matter came to a crisis on the death of John III. (1592). The heir to the throne was John's eldest son, Sigismund, already king of Poland and a devoted Catholic. The fear lest Sigismund might repeat his father's example, led Charles, as his residence in Sweden, and Charles came forward as their champion, and also as the defender of the Vasa dynasty against foreign interference. It was due entirely to him that Sigismund was forced to confirm the resolutions of the council of Upsala, thereby recognizing the fact that Sweden was essentially a Protestant state (see Sweden: History). In the ensuing years Charles's task was extraordinarily difficult. He had steadily to oppose Sigismund's reactionary tendencies; he had also to curb the nobility, which he did with cruel rigour. Necessity compelled him to work rather with the people than the gentry; hence it was that the Riksdag assumed under his government a power and an importance which it had never possessed before. In 1565 the Riksdags of Söderköping elected Charles regent, and his attempt to force Klas Fleming, governor of Finland, to submit to his authority, rather than to that of the king, provoked a civil war. Technically Charles was, without doubt, guilty of high treason, and the considerable minority of all classes which adhered to Sweden on his landing in Sweden in 1568 indisputably behaved like loyal subjects. But Sigismund was both an alien and a heretic to the majority of the Swedish nation, and his formal deposition by the Riksdag in 1590 was, in effect, a natural vindication and legitimation of Charles's position. Finally, the diet of Linköping (Feb. 24, 1600) declared that Sigismund and his posterity had forfeited the Swedish throne, and, passing over duke John, the second son of John III., a youth of ten, recognized duke Charles as their sovereign under the title of Charles IX.

Charles's short reign was an uninterrupted warfare. The hostility of Poland and the break up of Russia involved him in two overseas contests for the possession of Livonia and Ingris, while his pretensions to Lapland brought upon him a war with Denmark in the last year of his reign. In all these struggles he was more or less unsuccessful, owing partly to the fact that he had to do with superior generals (e.g. Chodkiewicz and Christian IV.) and partly to sheer ill-luck. Compared with his foreign policy, the domestic policy of Charles IX. was comparatively unimportant. It aimed at confirming and supplementing what had already been done during his father's reign, till the 6th of March 1604, after Duke John had formally renounced his rights to the throne, did Charles IX. begin to style himself king. The first deed in which the title appears is dated the 20th of March 1604; but he was not crowned till the 15th of March 1607. Four and a half years later Charles IX. died at Nyköping (Oct. 30, 1611). As a ruler he is the link between his great father and his still greater son. He consolidated the work of Gustavus Vasa, the creation of a great Protestant state: he prepared the way for the erection of the Protestant empire of Gustavus Adolphus. Swedish historians have been excusably indulgent to the father of their greatest ruler. Indisputably Charles was cruel, ungenial and vindictive; yet he seems, at all hazards, strenuously to have endeavoured to do his duty during a period of political and religious transition, and, despite his violence and brutality, possessed many of the qualities of a wise and courageous statesman. By his first wife Marie, daughter of the elector palatine Louis VI., he had six children, of whom only one daughter, Catherine, survived; by his second wife, Christina, daughter of Adolphus, duke of Holstein-Gottorp, he had five children, including Gustavus Adolphus and Charles Philip, duke of Finland.

CHARLES X. [Charles Gustavus] (1622–1660), king of Sweden, son of John Casimir, count palatine of Zweibrücken, and Catherine, sister of Gustavus Adolphus, was born at Nyköpings Castle on the 8th of November 1622. He learnt the art of war under the great Lennart Torstensson, being present at the second battle of Breitenfeld and at Jankowitz. From 1646 to 1648 he frequented the Swedish court. It was supposed that he would marry the queen regnant, Christina, but her unsurmountable objection to wedlock put an end to these anticipations, and to compensate her cousin for a broken half-promise she declared him (1649) her successor, despite the opposition of the senate created by the war. But he was soon declared for his cousin Charles, and was appointed generalissimo of the Swedish forces in Germany. The conclusion of the treaties of Westphalia prevented him from winning the military laurels he so ardently desired, but as the Swedish plenipotentiary at the executive congress of Nuremberg, he had unrivalled opportunities of learning diplomacy, in which science he speedily became a past-master. As the recognized heir to the throne, his position on his return to Sweden was not without danger, for the growing discontent with the queen turned the eyes of thousands to him as a possible deliverer. He therefore withdrew to the isle of Öland till the abdication of Christina (June 5, 1654) called him to the throne.

The beginning of his reign was devoted to the healing of domestic discords, and the rallying of all the forces of the nation round his standard for a new policy of conquest. He contracted a political marriage (Oct. 24, 1654) with Hedwig Leonora, the daughter of Frederick III., duke of Holstein-Gottorp, by way of securing a future ally against Denmark. The two great pressing national questions, war and the restitution of the alienated crown lands, were duly considered at the Riksdag which assembled at Stockholm in March 1655. The war question was decided in three days by a secret committee presided over by the king, who easily persuaded the delegates that a war with Poland was necessary and might prove very advantageous; but the consideration of the question of the subsidies due to the crown for military purposes was postponed to the following Riksdag (see Sweden: History). On the 10th of July Charles quitted Sweden to engage in his Polish adventure. By the time war was declared he had at his disposal 50,000 men and 50 warships. Hostilities had already begun with the occupation of Dünaburg (Dvinsk) in Polish Livonia by the Swedes (July 1, 1652), and the Polish army encamped among the marshes of the Netze concluded a convention (July 25) whereby the palatinates of Posen and Kalisz placed themselves under the protection of the Swedish king. Thereupon the Swedes entered Warsaw without opposition and occupied the whole of Great Poland. The Polish king John Casimir, fled to Silesia. Meanwhile Charles pressed towards Cracow, which was captured after a two months' siege. The fall of Cracow extinguished the last hope of the boldest Pole; but before the end of the year an extraordinary reaction began in Poland itself. On the 18th of October the Swedes invested the fortress-monastery of Czenstochow, but the place was heroically defended; and after a seventy days' siege the besiegers were compelled to retire with great loss.

This astounding success elicited an outburst of popular enthusiasm which gave the war a national and religious character. The tacitlessness of Charles, the rarity of his generals, the barbarity of his mercenaries, his refusal to legalize his position by summoning the Polish diet, his negotiations for the partition of the very state he affected to befriend, awoke the long slumbering public spirit of the country. In the beginning of 1656 John Casimir returned from exile and the Polish army was reorganized

and easier to defeat. By this time Charles had discovered that it was easier to defeat the Poles than to conquer Poland. His chief object, the conquest of Prussia, was still undecided, and new foes arose in the elector of Brandenburg, instigated by the ambition of the Swedish king. Charles forced the elector, indeed, at the point of the sword to become his ally and vassal (treaty of Königsberg, Jan. 17, 1656); but the Polish national rising now imperatively demanded his presence in the south. For weeks he scoured the interminable snow-covered plains of Poland in pursuit of the Polish guerillas, penetrating as far south as Jaroslau in Galicia, by which time he had lost two-thirds of his 15,000 men with no apparent result. His retreat from Jaroslau to Warsaw, with the fragments of his host, amidst three converging armies, in a marshy forest region, intersected in every direction by well-guarded rivers, was one of his most brilliant achievements. But his necessities were overwhelming. On the 21st of June Warsaw was retaken by the Poles, and four days later Charles was obliged to purchase the assistance of Frederick William by the treaty of Marienburg. On July 18-20 the combined Swedes and Brandenburgers, 18,000 strong, after a three days' battle, defeated John Casimir's army of 100,000 at Warsaw and reoccupied the Polish capital; but this brilliant feat of arms was altogether useless, and when the suspicious attitude of Frederick William compelled the Swedish king to last to open negotiations with the Poles, they refused the terms offered, the war was resumed, and Charles concluded an offensive and defensive alliance with the elector of Brandenburg (treaty of Labiau, Nov. 20) whereby it was agreed that Frederick William and his heirs should henceforth possess the full sovereignty of East Prussia.

This was an essential modification of Charles's Baltic policy; but the alliance of the elector had now become indispensable on almost any terms. So serious, indeed, were the difficulties of Charles X. in Poland that it was with extreme satisfaction that he received the tidings of the Danish declaration of war (June 1, 1657). The hostile action of Denmark enabled him honourably to emerge from the inglorious Polish imbroglio, and he was certain of the zealous support of his own people. He had learnt from Torstensson that Denmark was most vulnerable if attacked from the south, and, imitating the strategy of his master, he fell upon her with a velocity which paralysed resistance. At the end of June 1657, at the head of 8000 seasoned veterans, he broke up from Bromberg in Prussia and reached the borders of Holstein on the 18th of July. The Danish army at once dispersed and the duchy of Bremen was recovered by the Swedes, who in the early autumn swarmed over Jutland and firmly established themselves in the country. The state of Fredrikshald (Fredrikshald) held Charles's little army by the mid-August to mid-October, while the fleet of Denmark, after a stubborn two days' battle, compelled the Swedish fleet to abandon its projected attack on the Danish islands. The position of the Swedish king had now become critical. In July an offensive and defensive alliance was concluded between Denmark and Poland. Still more ominously, the elector of Brandenburg, perceiving Sweden to be in difficulties, joined the league against her and compelled Charles to accept the proffered mediation of Cromwell and Mazarin. The negotiations foundered, however, upon the refusal of Sweden to refer the points in dispute to a general peace-congress, and Charles was still further encouraged by the capture of Fredriksodde ('Oct. 23-24'), whereupon he began to make preparations for conveying his troops over to Funen in transport vessels. But soon another and cheaper expedient presented itself. In the middle of December 1657 began the great frost which was to be so fatal to Denmark. In a few weeks the cold had grown so intense that even the freezing of the arm of the sea with so rapid a current as that of the Little Belt became a conceivable possibility; and henceforth meteorological observations formed an essential part of the strategy of the Swedes. On the 28th of January 1658, Charles X. arrived at Haderslev (Hadersleben) in South Jutland, when it was estimated that in a couple of days the ice of the Little Belt would be firm enough to bear even the passage of a mail-clad host. The cold during the night of the 29th of January was most severe; and early in the morning of the 30th the Swedish king gave the order to start, the horsemen dismounting where the ice was weakest, and prudently leading the horses as far apart as possible, when they swung into their saddles again, closed their ranks and made a dash for the shore. The Danish troops lining the opposite coast were quickly overpowered, and the whole of Funen was won with the loss of only two companies of cavalry, which disappeared under the ice while fighting with the Danish left wing. Pursuing his irresistible march, Charles X., with his eyes fixed steadily on Copenhagen, resolved to cross the frozen Great Belt also. After some hesitation, he accepted the advice of his chief engineer officer Eric Dahlberg, who acted as pioneer throughout and chose the more circuitous route from Svenborg, by the islands of Langeland, Laaland and Falster, in preference to the direct route from Nyborg to Korsør, which would have been across a broad, almost uninterrupted expanse of ice. Yet this second adventure was not embarked upon without much anxious consideration. A council of war, which met at two o'clock in the morning to consider the practicability of Dahlberg's proposal, at once dismissed it as criminally hazardous. Even the king wavered for an instant; but, Dahlberg persisting in his opinion, Charles overruled the objections of the commanders. On the night of the 5th February the transit began, the cavalry leading the way through the snow-covered ice, which quickly thaws beneath the horses' hoofs so that the infantry which followed after had to wade through half an ell of sludge, fearing every moment lest the rotting ice should break beneath their feet. At three o'clock in the afternoon, Dahlberg leading the way, the army reached Grimsted in Laaland without losing a man. On the 8th of February Charles reached Falster. On the 11th he stood safely on the soil of Sjælland (Zealand). Not without reason did the medal struck to commemorate "the glorious transit of the Baltic Sea" bear the haughty inscription: *Natura hoc debuit uni.* An exploit unique in history had been achieved.

The crushing effect of this unheard-of achievement on the Danish government found expression in the treaties of Tastrup (Feb. 18) and Roskilde (Feb. 26, 1658), whereby Denmark sacrificed nearly half her territory to save the rest (see DENMARK: History). But this was even too small to satisfy the conqueror. Military ambition and greed of conquest moved Charles X. to what, divested of all its pomp and circumstance, was an outrageous act of political brigandage. At a council held at Gottorp (July 7), Charles X. resolved to wipe from the map of Europe an inconvenient rival, and without any warning, in defiance of all international equity, reduced, with his victorious army, Denmark a second time. For the details of this second invasion and the concomitant diplomatic intervention of the western powers, see DENMARK: History, and SWEDEN: History. Only after great hesitation would Charles X. consent to reopen negotiations with Denmark direct, at the same time proposing to exercise pressure upon the enemy by a simultaneous winter campaign in Norway. Such an enterprise necessitated fresh subsidies from his already impoverished people, and obliged him in December 1659 to cross over to Sweden to meet the estates, whom he had summoned to Gothenburg. The lower estates murmured at the imposition of fresh burdens; and Charles had need of all his adroitness to persuade them that his demands were reasonable and necessary. At the very beginning of the Riksdag, in January 1660, it was noticed that the king was ill; but he spared himself as little in the council-chamber as in the battle-field, till death suddenly overtook him on the night of the 13th of February 1660, in his thirty-eighth year. The abrupt cessation of such an inexhaustible fount of enterprise and energy was a distinct loss to Sweden; and signs are not wanting that, in his latter years, Charles had begun to feel the need and value of repose. Had he lived long enough to overcome his martial ardour, and develop and organize the empire he helped to create, Sweden might perhaps have remained a great power to this day. Even so she owes her natural frontiers in the Scandinavian peninsula to Charles X.

Haumant, La Guerre du nord et la paix d’Oliva (Paris, 1893); Robert Nisbet Bain, Scandianva (Cambridge, 1905); G. Jones, The Diplomatic Relations between Cromwell and Charles X. (Lincoln, Nebraska, 1897). (R.N.B.)

CHARLES XI. (1655—1697), king of Sweden, the only son of Charles X., and Hedwig Leonora of Holstein-Gottorp, was born in the palace at Stockholm, on the 24th of November 1655. His father, who died when the child was in his fourth year, left the care of his education to the regents whom he had appointed. So shamefully did they neglect their duty that when, at the age of seventeen, Charles XI. attained his majority, he was ignorant of the very rudiments of state-craft and almost illiterate. Yet those nearest to him had great hopes of him. He was known to be truthful, upright and God-fearing; if he had neglected his studies it was to devote himself to manly sports and exercises; and in the pursuit of his favourite pastime, bear-hunting, he had already given proofs of the most splendid courage. It was the general disaster produced by the speculative policy of his former guardians which first called forth his sterling qualities and hardened him into a premature manhood. He was a man of indomitable energy he at once attempted to grapple with the difficulties of the situation, waging a never-ending and desperate struggle with sloth, corruption and incompetence. Amidst universal anarchy, the young king, barely twenty years of age, inexperienced, ill-served, snatching at every expedient, worked day and night in his newly-formed camp in Scania (Skåne) to arm the nation for its mortal struggle. The victory of Fyllebro (Aug. 17, 1670), when Charles and his commander-in-chief S. G. Helmsfield routed a Danish division, was the first blow of good luck, and on the 4th of December, on the tableland of Helgonaöck, near Lund, the young Swedish monarch defeated Christian V. of Denmark, who also commanded his army in person. After a ferocious contest, the Danes were practically annihilated. The battle of Lund was, relatively to the number engaged, one of the bloodiest engagements of modern times. More than half the combatants (8,537, of whom 3,000 were Swedes) actually perished on the battlefield. All the Swedish commanders showed remarkable ability, but the chief glory of the day indisputably belongs to Charles XI. This great victory restored to the Swedes their country and Swedish and Norwegian. In the following year, Charles with 90,000 men routed 12,000 Danes near Malmo (July 15, 1675). This proved to be the last pitched battle of the war, the Danes never again venturing to attack their once more invincible enemy in the open field. In 1679 Louis XIV. dictated the terms of a general pacification, and Charles XI., who bitterly resented “the insufferable tutelage” of the French king, was forced at last to acquiesce in a peace which at least left his empire practically intact. Charles devoted the rest of his life to the gigantic task of rehabilitating Sweden by means of a reduction, or recovery of alienated crown lands, a process which involved the examination of every title deed in the kingdom, and resulted in the complete readjustment of the finances. But vast as it was, the reduction represents only a tithe of Charles XI.’s immense activity. The constructive part of his administration was equally thorough-going, and entirely beneficial. Here, too, everything was due to his personal initiative. Finance, commerce, the national armaments by sea and land, and the internal procedure, church government, education, art and science, everything, in short—emerged rescast from his shaping hand. Charles XI. died on the 5th of April 1697, in his forty-first year. But his beloved consort Ulrica Leonora of Denmark, from the shock of whose death in July 1693 he never recovered, he had seven children, of whom only three survived him, a son Charles, and two daughters, Hedwig Sophia, duchess of Holstein, and Ulrica Leonora, who ultimately succeeded her brother on the Swedish throne. After Gustavus Vasa and Gustavus Adolphus Charles XI. was, perhaps, the greatest of all the kings of Sweden. His modest, homespun figure has indeed been unduly eclipsed by the brilliant and colossal shapes of his heroic father and his meteoric son; yet in reality Charles XI. is far worthier of admiration than either Charles X. or Charles XII. He was in an eminent degree a great master-builder. He found Sweden in ruins and devoted his whole life to laying the solid foundations of a new order of things which, in its essential features, has endured to the present day.

See Martin Veibull, Sveriges Storstred (Stockholm, 1881); Frederick Ferdinand Carlson, Sveriges Historia under Konungarnas af Pflastra Huset (Stockholm, 1883—1885); Robert Nisbet Bain, Scandianva (Cambridge, 1905); O. Sjösten, Karl den Eiffe och Svenska Folket (Stockholm, 1897); J. A. de Mesmes d’Avaux, Négociations du comte d’Avaux, 1693, 1697, 1698 (Utrecht, 1882, &c.).

CHARLES XII. (1682—1718), king of Sweden, the only surviving son of Charles XI. and Ulrica Leonora, daughter of Frederick III. of Denmark, was born on the 17th of June 1682. He was carefully educated by excellent tutors under the watchful eyes of his parents. His natural parts were excellent; and a strong bias in the direction of abstract thought, and mathematics in particular, was noticeable at an early date. His memory was astonishingly great and enabled him to translate Latin into Swedish or German, or Swedish or German into Latin at sight. Charles XI. personally supervised his son’s physical training. He was taught to ride before he was four, at eight was quite at home in his saddle, and when only eleven, brought down his first bear at a single shot. As he grew older his father took him on all his rounds, reviewing troops, inspecting studs, foundries, dockyards and granaries. Thus the lad was gradually initiated into the ministrations of administration. The influence of Charles XI. over his son was, indeed, far greater than is commonly supposed, and it accounts for much in Charles XII.’s character which is otherwise inexplicable, for instance his precocious reserve and taciturnity, his dislike of everything French, and his inordinate contempt for purely diplomatic methods. On the whole, his early training was admirable; but the young prince was not allowed the opportunity of gradually gaining experience under his guardians. At the Riksdag assembled at Stockholm in 1697, the estates, jealous of the influence of the regents, offered full sovereignty to the young monarch, who soon acquiesced, and, after some hesitation, Charles at last declared that he could not respect the urgent appeal of his subjects and would take over the government of the realm “in God’s name.” The subsequent coronation was marked by portentous novelties, the most significant of which was the king’s omission to take the usual coronation oath, which omission was interpreted to mean that he considered himself under no obligation to his subjects. The general opinion of the young king was, however, still favourable. His conduct was evidently regulated by strict principle and not by mere caprice. His refusal to countenance torture as an instrument of judicial investigation, on the ground that “confessions so extorted give no sure criteria for forming a judgment,” showed him to be more humane as well as more enlightened than the majority of his council, which had defended the contrary opinion. His intense application to affairs is noted by the English minister, John Robinson (1650—1723), who informed his court that there was every prospect of a happy reign in Sweden, provided his majesty were well served and did not injure his health by too much work. The coalition against Sweden by Johann Reinhold Patzig, which resulted in the outbreak of the Great Northern War (1699), abruptly put an end to Charles XII.’s political apprenticeship, and forced into his hand the sword he was never again to relinquish. The young king resolved to attack the nearest of his three enemies—Denmark—first. The timidity of the Danish admiral Ulrik C. Gysdenlöve, and the daring of Charles, who forced his nervous and protesting admiral to attempt the passage of the eastern channel of the Sound, the dangerous fijterend, hitherto reputed to be un navigable, enabled the Swedish king to effect a landing at Humlebaek in Sjælland (Zealand), a few miles north of Copenhagen (Aug. 4, 1700). He now hoped to accomplish what his grandfather, fifty years before, had vainly attempted—the destruction of the Danish-Norwegian monarchy by capturing its capital. But for once prudential considerations prevailed, and the short and bloodless war was terminated by the peace of Trondheim (Aug. 18, whereby
Frederick IV. conceded full sovereignty to Charles's ally and kinsman the Duke of Gottorp, besides paying him an indemnity of several millions and solemnly engaging to commit no hostilities against Sweden in future. From Sjaelland Charles now hastened to Livonia with 8000 men. On the 6th of October he had reached Parnau, with the intention of first relieving Riga, but, hearing that Narva was in great straits, he decided to turn northwards against the tsar. He set out for Narva on the 13th of November, against the advice of all his generals, who feared the effect on untried troops of a week's march through a wasted land, along boggy roads guarded by no fewer than three formidable passes which a little engineering skill could easily have made impregnable. Fortunately, the two first passes were unoccupied; and the third, Pyhjijogi, was captured by Charles, who with 400 horsemen put 6000 Russian cavalry to flight. On the 19th of November the little army reached Laegna, a village about 9 m. from Narva, whence it signalled its approach to the beleaguered fortress, and early on the following morning it advanced in battle array. The attack on the Russian fortified camp began at two o'clock in the afternoon, in the midst of a violent snowstorm; and by nightfall the whole position was in the hands of the Swedes: the Russian army was annihilated. The triumph was as cheap as it was crushing; it cost Charles less than 2000 men.

After Narva, Charles XII. stood at the parting of ways. His best advisers urged him to turn all his forces against the panic-stricken Muscovites; to go into winter-quarters amongst them and live at their expense; to fan into a flame the smouldering discontent caused by the reforms of Peter the Great, and so disable Russia for some time to come. But Charles's determination promptly to punish the treachery of Augustus prevailed over every other consideration. It is easy from the vantage-point of two centuries to criticize Charles XII. for neglecting the Russians to pursue the Saxons; but at the beginning of the 18th century his decision was natural enough. The real question was, which of the two foes was the more dangerous, and Charles had many reasons to think the civilized and martial Saxons far more formidable than the imbecile Muscovites. Charles also rightly felt that he could never trust the treacherous Augustus to remain quiet, even if he made peace with him. To leave such a foe in his rear, while he plunged into the heart of Russia would have been hazardous indeed. From this point of view Charles's whole Polish policy, which has been blamed so long and so loudly—the policy of placing a nominee of his own on the Polish throne—takes quite another complexion: it was a policy not of overvaulting ambition, but of prudent self-defence.

First, however, Charles cleared Livonia of the invader (July 1701), subsequently occupying the duchy of Courland and converting it into a Swedish governor-generalship. In January 1702 Charles established himself at Bielowice in Lithuania, and, after issuing a proclamation declaring that "the elector of Saxony" had forfeited the Polish crown, set out for Warsaw, which he reached on the 14th of May. The cardinal-primate was then sent for and commanded to summon a diet, for the purpose of deposing Augustus. A fortnight later Charles chose W. 50,000 men for Mazzini, the next elector; on the 2nd of July routed the combined Poles and Saxons at Klissow; and three weeks later, captured the fortress of Cracow by an act of almost fabulous audacity. Thus, within four months of the opening of the campaign, the Polish capital and the coronation city were both in the possession of the Swedes. After Klissow, Augustus made every effort to put an end to the war, but Charles would not even consider his offers. By this time, too, he had conceived a passion for the perils and adventures of warfare. His character was hardening, and he deliberately adopted the most barbarous expedients for converting the Augustan Poles to his views. Such commands as "ravage, singe, and burn all about, and reduce the whole district to a wilderness!" "sweat contributions well out of them!" "rather let the innocent suffer than the guilty escape!" became painfully frequent in the mouth of the young commander, not yet 21, who was far from being naturally cruel.

The campaign of 1703 was remarkable for Charles's victory at Pultusk (April 21) and the long siege of Thorn, which occupied him eight months but cost him only 50 men. On the 2nd of July 1704, with the assistance of a bribing fund, Charles's ambassador at Warsaw, Count Arvid Bernard Horn, succeeded in forcing through the election of Charles's candidate to the Polish throne, Stanislaus Leszczyński, who could not be crowned however till the 24th of September 1705, by which time the Saxons had again been defeated at Puntz. From the autumn of 1705 to the spring of 1706, Charles was occupied in pursuing the Russian auxiliary army under Ogilvie through the forests of Lithuania. On the 5th of August, he recrossed the Vistula and established himself in Saxony, where his presence in the heart of Europe at the very crisis of the war of the Spanish Succession, fluttered all the western diplomats. The allies, in particular, at once suspected that Louis XIV. had bought the Swedes. Marlborough was forthwith sent from the Hague to the castle of Altranstäd near Leipzig, where Charles had fixed his headquarters, "to endeavour to penetrate the designs" of the king of Sweden. He soon convinced himself that western Europe had nothing to fear from Charles, and that no bribes were necessary to turn the Swedish arms from Germany to Russia. Five months later (Sept. 1707) Augustus was forced to sign the peace of Altranstäd, whereby he resigned the Polish throne and renounced every anti-Swedish alliance. Charles's departure from Saxony was delayed for twelve months by a quarrel with the emperor. The court of Vienna had treated the Silesian Protestants with tyrannical severity, in direct contravention of the treaty of Osnabrück, of which Sweden was one of the guarantors; and Charles demanded summary and complete restitution so dictatorially that the emperor prepared for war. But the allies interfered in Charles's favour, lest he might be tempted to aid France, and induced the emperor to satisfy all the Swedish king's demands, the maritime Powers at the same time agreeing to guarantee the provisions of the peace of Altranstäd.

Nothing now prevented Charles from turning his victorious army against the tsar; and on the 13th of August 1707, he evacuated Saxony at the head of the largest host he ever commanded, consisting of 24,000 horse and 20,000 foot. Delayed during the autumn months in Poland by the tardy arrival of reinforcements from Pomerania, it was not till November 1707 that Charles was able to take the field. On New Year's Day 1708 he crossed the Vistula, though the ice was in a dangerous condition. On the 4th of July 1708 he cut in two the line of the Russian army, 6 m. long, which barred his progress on the Wabia, near Holowczyn, and compelled it to retreat. The victory of Holowczyn, memorable besides as the last pitched battle won by Charles XII., opened up the way to the Dnieper. The Swedish army now began to suffer severely, bread and fodder running short, and the soldiers subsisting entirely on captured bullocks. The Russians slowly retired before the invader, burning and destroying everything in his path. On the 20th of December, it was plain to Charles that the Wabia was accessible. But the idea of a retreat was intolerable to him, so he determined to march southwards instead of northwards as suggested by his generals, and join his forces with those of the hetman of the Dnieperian Cossacks, Ivan Mazepa, who had 100,000 horsemen and a fresh and fruitful land at his disposal. Short of falling back upon Livonia, it was the best plan adoptable in the circumstances, but it was rendered abortive by Peter's destruction of Mazepa's capital Baturin, so that when Mazepa joined Charles at Horke, on the 8th of November 1708, it was as a ruined man with little more than 1300 personal attendants (see Mazepa-Koleddensky). A still more serious blow was the destruction of the relief army which Levenhaupt was bringing to Charles from Livonia, and which, hampered by hundreds of loaded wagons, was overtaken and almost destroyed by Peter at Lyesna after a two days' battle against fourfold odds (October).

The very elements now began to fight against the persisting but still unconquered host. The winter of 1708 was the severest that Europe had known for a century. By the 1st of November
firewood would not ignite in the open air, and the soldiers warmed themselves over big bonfires of straw. By the time the army reached the little Ukrainian fortress of Hadzja in January 1700, wine and spirits froze into solid masses of ice; birds on the wing fell dead; saliva congealed on its passage from the mouth to the ground. "Nevertheless," says an eye-witness, "though earth, sea and sky were against us, the king's orders had to be obeyed and the daily march made."

Never had Charles XII. seemed so superhuman as during these awful days. It is not too much to say that his imperturbable equanimity, his serene bonhomie kept the host together. The frost broke at the end of February 1700, and then the spring floods put an end to all active operations till May, when Charles began the siege of the fortress of Poltava, which he wished to make a base for subsequent operations while awaiting reinforcements from Sweden and Poland. On the 7th of June a battle wound put Charles 

CHARLES XIII. (1748-1818), king of Sweden and Norway, the second son of Adolphus Frederick, king of Sweden, and Louisa Ulrica, sister of Frederick the Great, was born at Stockholm on the 7th of October 1748. In 1772 he co-operated in the revolutionary plans of his brother Gustavus III. (q.v.). On the outbreak of the Russo-Swedish War of 1778 he served with distinction as admiral of the fleet, especially at the battles of Hogland (June 17, 1789) and Oland (July 26, 1789). On the latter occasion he would have won a signal victory but for the unaccountable remissness of his second-in-command, Admiral Liljehorn. On the death of Gustavus III., Charles, now duke of Svedemania, acted as regent of Sweden till 1786; but the real ruler of the country was the narrow-minded and vindictive Gustaf Adolf Reuterholm (q.v.), whose mischievous influence over him was supreme. These four years were perhaps the most miserable and degrading in Swedish history (an age of lead succeeding an age of gold, as it has well been called) and may be briefly described as alternations of fantastic Jacobinism and ruthless despotism. On the accession of Gustavus IV. (November 1796), the duke became a mere cipher in politics till the 13th of March 1809, when those who had dethroned Gustavus IV. appointed him regent, and finally elected him king. But by this time he was prematurely decrepit, and Bernadotte (see Charles XIV.) took over the government as soon as he landed in Sweden (1809).

CHARLES XIV. (1761-1844), king of Sweden and Norway, born at Pau on the 26th of January 1761, was the son of Henri Bernadotte (1711-1780), procurator at Pau, and Jeanne St Jean (1725-1809). The family name was originally Deu Poney, but was changed into Bernadotte in the beginning of the 17th century. Bernadotte's christian names were Jean Baptiste; he added the name Jules subsequently. He entered the French army on the 3rd of September 1777 and first saw service in Corsica. On the outbreak of the Revolution his eminent military qualities brought him speedy promotion. In 1794 we find him as brigadier attached to the army of the Sambre et Meuse, and after Jourdan's victory at Fleurus he was appointed a general of division. At the battle of Theiningen, 1796, he contributed, more than any one else, to the successful retreat of the French army over the Rhine after its defeat by the archduke Charles. In 1797 he brought reinforcements from the Rhine to Bonaparte's army in Italy, distinguishing himself greatly at the passage of the Tagliamento, and in 1798 was sent as ambassador to Vienna, but was compelled to quit his post owing to the disturbances caused by his hoisting the tricolor over the embassy. On the 16th of August 1798 he married Désirée Clary (1777-1860), the daughter of a Marseilles banker, and sister of Joseph Bonaparte.

From the 2nd of July to the 14th of September he was war minister, in which capacity he displayed great ability. About this time he held aloof from Bonaparte, but, though he declined to help Napoleon in the preparations for the coup d'état of November 1799, he accepted employment from the Consulate, and from April 1800 till the 18th of August 1801 commanded the army in La Vendée. On the introduction of the empire he
was one of the eighteen marshals of France, and, from June 1804 to September 1805, acted as governor of the recently occupied Hanover. During the campaign of 1805, Bernadotte with an army corps from Hanover co-operated in the great movement which resulted in the shutting up of Mack at Ulm. He was rewarded for his services at Austerlitz (December 2, 1805) by the principality of Ponte Corvo (June 5, 1806), but during the campaign against Prussia, the same year, was severely reproached by Napoleon for not participating with his army corps in the battles of Jena and Auerstädt, though close at hand. In 1808, as governor of the Hanse towns, he was to have directed the expedition against Sweden, via the Danish islands, but the plan came to nought because of the want of transports and the defection of the Spanish contingent. In the war against Austria, Bernadotte led the Saxony contingent at the battle of Wagram, on which occasion, on his own initiative he issued an order of the day, attributing the victory principally to the valour of his Saxons, which Napoleon at once disavowed.

Bernadotte, considerably piqued, thereupon returned to Paris, where the council of ministers entrusted him with the defence of the Netherlands against the English. In 1810 he was about to enter upon his new post of governor of Rome when he, unusually, conferred his acceptance of it on March 18 on the king of Sweden, because a large part of the Swedish army, in view of future complications with Russia, was in favour of electing a soldier, and partly because Bernadotte was very popular in Sweden, owing to the kindness he had shown to the Swedish prisoners during the late war with Denmark. The matter was decided by one of the Swedish couriers, Baron Karl Otto Mörner, who, entirely on his own initiative, offered the succession to the Swedish crown to Bernadotte. Bernadotte communicated Mörner's offer to Napoleon, who treated the whole affair as an absurdity. Bernadotte thereupon informed Mörner that he would not refuse the honour if he were duly elected. Although the Swedish government, amazed at Mörner's effrontery, at once placed him under arrest on his return to Sweden, the candidature of Bernadotte gradually gained favour there, and, on the 21st of August 1810, he was elected crown-prince.

On the 2nd of November Bernadotte made his solemn entry into Stockholm, and on the 5th he received the homage of the estates and was adopted by Charles XIII under the name of Charles John. The new crown-prince was very soon to become one of the most popular and the most powerful man in Sweden. The infirmity of the old king and the dissensions in the council of state placed the government, and especially the control of foreign affairs, entirely in his hands. The keynote of his whole policy was the acquisition of Norway, a policy which led him into many tortuous ways (see Sweden: History), and made him a very tricky ally during the struggle with Napoleon in 1813. Great Britain and Prussia very properly insisted that Charles John's first duty was to them, the former power rigorously protesting against the expenditure of her subsidies on the nefarious Norwegian adventure before the common enemy had been crushed. After the defeats of Lützen and Bautzen, it was the Swedish crown-prince who put fresh heart into the allies; and at the conference of Trachenberg he drew up the general plan for the campaign which began after the expiration of the truce of Plütschwitz. Though undoubtedly sparing his Swedes unduly, to the just dissatisfaction of the allies, Charles John, as commander-in-chief of the northern army, successfully defended the approaches to Berlin against Oudinot in August and against Ney in September; but after Leipzig he went his own way, determined at all hazards to cripple Denmark and secure Norway. For the events which led to the union of Norway and Sweden, see Sweden: History and Norway: History. As unialional king, Charles XIV. (who succeeded to that title in 1818 on the death of Charles XIII.) was popular in both countries. Though his ultra-conservative views were detested, and as far as possible opposed (especially after 1823), his dynasty was never in serious danger, and Swedes and Norsemen alike were proud of a monarch with a European reputation. It is true that the Riksdag of 1840 meditated compelling him to abdicate, but the storm blew over and his jubilee was celebrated with great enthusiasm in 1843. He died at Stockholm on the 9th of March 1844. His reign was one of undisturbed peace and the great material development of the two kingdoms during the first half of the 19th century was largely due to his energy and foresight.

Scheler, Bernadotte regi (Paris, 1899); G. R. Lagerjérn, Napoleon och Carl Johan under kriget i Tyskland, 1813 (Stockholm, 1899).

CHARLES XV. (1816–1872), king of Sweden and Norway, eldest son of Oscar I., king of Sweden and Norway, and Josephine Beauharnais of Leuchtenberg, was born on the 3rd of May 1826. On the 15th of June 1850 he married Louise, daughter of Prince Frederick of the Netherlands. He became regent on the 25th of September 1857, and king on the death of his father (8th of July 1859). As crown-prince, Charles's brusque and downright manners had led many to regard his future accession with some apprehension, yet he proved to be one of the most popular of Scandinavian kings and a constitutional ruler in the best sense of the word. His reign was remarkable for its manifold and far-reaching reforms. Sweden's existing communal law (1862), ecclesiastical law (1863) and criminal law (1864) were enacted appropriately enough under the direction of a king whose motto was: "Build up the land upon the laws!" Charles XV. also materially assisted Geer (q.v.) to carry through his memorable reform of the constitution in 1863. Charles was a warm advocate of "Scandinavianism" and the political solidarity of the three northern kingdoms, and his warm friendship for Frederick VII., it is said, led him, to give half promises of help to Denmark on the eve of the war of 1864, which, in the circumstances, were perhaps misleading and unjustifiable. In view, however, of the unpreparedness of the Swedish army and the difficulties of the situation, Charles was forced to observe a strict neutrality. He died at Malmö on the 18th of September 1872. Charles XV. was highly gifted in many directions. He attained to some eminence as a painter, and his Digte show him to have been a true poet. He left but one child, a daughter, Louisa Josephina Eugenia, who in 1869 married the crown-prince Frederick of Denmark.

CHARLES (c. 1310–1364), duke of Brittany, known as Charles of Blois and Charles of Céüillou, was the son of Guy of Châtillon, count of Blois (d. 1342), and of Marguerite of Valois, sister of Philip VI. of France. In 1337 he married Jeanne of Penthièvre (d. 1384), daughter of Guy of Brittany, count of Penthièvre (d. 1331), and thus acquired a right to the succession of the duchy of Brittany. On the death of John III., duke of Brittany, in April 1341, his brother John, count of Montfort-l'Amaury, and his niece Jeanne, wife of Charles of Blois, disputed the succession. Charles of Blois, sustained by Philip VI., captured John of Montfort, who was supported by King Edward III. at Nantes, besieged his wife Jeanne of Flanders at Hennebont, and took Quimper and Guérande (1344). But next year his partisans were defeated at Cadoret, and in June 1347 he was himself wounded and taken prisoner at Roche-Derrien. He was not liberated until 1356, when he continued the war against the young John of Montfort, and perished in the battle of Auray, on the 29th of September 1364. Charles bore a high reputation for piety, and was believed to have performed miracles. The Roman Church has canonized him.

See Siméon Luce, Histoire de Bertrand le Guesclin et de son époque (Paris, 1876).

CHARLES, called LE BOLD (1433–1477), duke of Burgundy, son of Philip the Good of Burgundy and Isabella of Portugal, was born at Dijon on the 10th of November 1433. In his father's lifetime he bore the title of count of Charolais. He was brought up under the direction of the seigneur d'Auxy, and early showed great application to study and also to warlike exercises. Although he was on familiar terms with the dauphin (afterwards Louis XI.), when the latter was a refugee at the court of Burgundy, he could
with Sigismund of Austria, to whom he refused to restore his possessions in Alsace for the stipulated sum; with the Swiss, who supported the free towns of Alsace in their revolt against the tyranny of the ducal governor, Peter von Hagenbach (who was condemned and executed by the rebels in May 1474); and finally, with René of Lorraine, with whom he disputed the succession of Lorraine, the possession of which had united the two principal portions of Charles’s territories—Flanders and the duchy and county of Burgundy. All these enemies, incited and supported as they were by Louis, were not long in joining forces against their common adversary. Charles suffered a first rebuff in endeavouring to protect his kinsman, the archbishop of Cologne, against his rebel subjects. He spent ten months (July 1474–June 1475) in besieging the little town of Neuss on the Rhine, but was compelled by the approach of a powerful imperial army to raise the siege. Moreover, the expedition he had persuaded his brother-in-law, Edward IV, of England, to undertake against him was supported by the treaty of Picquigny (29th of August 1475). He was more successful in Lorraine, where he seized Nancy (30th of November 1475). From Nancy he marched against the Swiss, hanging and drowning the garrison of Gramson in spite of the capitulation. Some days later, however, he was attacked before Gramson by the confederate army and suffered a shambal defeat, being compelled to fly with a handful of attendants, and leaving his artillery and an immense booty in the hands of the allies (February 1476). He succeeded in raising a fresh army of 30,000 men, with which he attacked Morat, but he was again defeated by the Swiss army, assisted by the cavalry of René of Lorraine (22nd of June 1476). On the 6th of October Charles lost Nancy, which was re-entered by René. Making a last effort, Charles formed a new army and arrived in the depth of winter before the walls of Nancy. Having lost many of his troops through the severe cold, it was with only a few thousand men that he met the joint forces of the Lorrainers and the Swiss, who had come to the relief of the town (6th of January 1477). He himself perished in the fight, his mutilated body being discovered some days afterwards.

Charles the Bold has often been regarded as the last representative of the feudal spirit—a man who possessed no other quality than a blind bravery—and accordingly has often been contrasted with his rival Louis XI. as representing modern politics. In reality, he was a prince of wide knowledge and culture, knowing several languages and austere in morals; and although he cannot be acquitted of occasional harshness, he had the secret of winning the hearts of his subjects, who never refused him their support in times of difficulty. He was thrice married—to Catherine (d. 1446), daughter of Charles VII. of France, by whom he had one daughter, Mary, afterwards the wife of the Emperor Maximilian I.; to Isabella (d. 1469), daughter of Charles I., duke of Bourbon; and to Margaret of York, sister of Edward IV. of England, whom he married in 1468.

The original authorities for the life and times of Charles the Bold are the numerous French, Burgundian and Flemish chronicles of the latter part of the 15th century. Special mention may be made of the Mémoires de Philippe de Comines, and of the Mémoires and other works of Olivier de la Marche. See also A. Molinié, Charles le Bold (1902), and Répertoire des sources historiques, part iii. (1904). Charles the Bold, by J. F. Kirk (1863–1868), is a good English translation of his memoirs. For its French text see Histoire de France, tome vii. (1908). For a general sketch of the relations between France and Burgundy at this time see E. Lavisse, Histoire de France, tome iv. (1902).
heritage without a civil war, but he was speedily victorious and made his position secure by treating his opponents with great clemency. He now devoted himself to promoting the welfare of his subjects, and did his utmost to support the cause of Christianity, both by his bounty and by his example. He well deserved the surname of Le Bon, by which he is known to posterity. He refused the offer of the crown of Jerusalem on the death of Baldwin, and declined to be nominated as a candidate for the imperial crown in succession to the emperor Henry V. He was murdered in the church of St Donat at Bruges on the 2nd of March 1127.

See J. Perroel, Histoire du règne de Charles le Bon, précédé d'un résumé de l'histoire de Flandres (Brussels, 1830).

CHARLES I. (c. 950–c. 992), duke of Lower Lorraine, was a younger son of the Frankish king Louis IV., and consequently a member of the Carolingian family. Unable to obtain the duchy of Burgundy owing to the opposition of his brother, King Lothair, he won on the court of his maternal uncle, the emperor Otto the Great, about 965, and in 977 received from the emperor Otto II. the duchy of Lower Lorraine. His authority in Lorraine was nominal; but he aided Otto in his struggle with Lothair, and on the death of his nephew, Louis V., made an effort to secure the Frankish crown. Hugh Capet, however, was the successful candidate and war broke out. Charles had gained some successes and had captured Reims, when in 991 he was treacherously seized by Adalberon, bishop of Laon, and handed over to Hugh. Imprisoned with his wife and children at Orleans, Charles did not long survive his humiliation. His eldest son Otto, duke of Lower Lorraine, died in 1005.

CHARLES II. (d. 1431), duke of Lorraine, called The Bold, is sometimes referred to as Charles I. A son of Duke John I., he succeeded his father in 1399; but he neglected his duchy and passed his life in warfare. He died on the 23rd of January 1431, leaving two daughters, one of whom, Isabella (d. 1459), married John I. of Anjou (1409–1480), king of Naples, who succeeded his father-in-law as duke of Lorraine.

CHARLES III. or II. (1543–1608), called The Great, duke of Lorraine, was a son of Duke Francis I. (d. 1545), and a descendant of René of Anjou. He was an infant when he became duke, and was brought up at the court of Henry II. of France, marrying Henry’s daughter Claude in 1559. He took part in the wars of religion in France, and was a member of the League; but he was overshadowed by his kinsmen the Guises, although he was a possible candidate for the French crown in 1589. The duke, who was an excellent ruler of Lorraine, died at Nancy on the 14th of May 1608. He had three sons: Henry (d. 1624) and Francis (d. 1633), who became in turn dukes of Lorraine, and Charles (d. 1607), bishop of Metz and Strassburg.

CHARLES IV. or III. (1604–1675), duke of Lorraine, was a son of Duke Francis II., and was born on the 5th of April 1604. He became heir-presumptive to the duchy of his father in 1624, and obtained the duchy of Bar through his marriage with his cousin Nicole (d. 1657), daughter of Duke Henry. Mixing in the turbulent politics of his time, he was in continual conflict with the crown of France, and spent much of his time in assisting his enemies and in losing and regaining his dukies (see Lorraine). He lived an adventurous life, and in the intervals between his several struggles with France fought for the emperor Ferdinand II. at Nordlingen and elsewhere; talked of succouring Charles I. in England; and after the conclusion of the treaty of Westphalia in 1648 entered the service of Spain. He died on the 18th of September 1675, leaving by his second wife, Béatrix de Cusance (d. 1663), a son, Charles Henry, count of Vaudemont (1642–1725).

CHARLES V. or IV. (1643–1690), duke of Lorraine, nephew of Duke Charles IV., was born on the 3rd of April 1643, and in 1664 received a colonelcy in the emperor’s army. In the same year he fought with distinction at the battle of St Gotthard, in which he captured a standard from the Turks. He was a candidate for the elective crown of Poland in 1668. In 1670 the emperor made him general of horse, and during the following years he was constantly on active service, first against the Turks and subsequently against the French. At Seneff (1674) he was wounded. In the same year he was again a candidate for the Polish crown, but was unsuccessful, John Sobieski, who was not to be associated with him in his greatest feat of arms, being elected. In 1675, on the death of Charles IV., he rode with a cavalry corps into the duchy of Lorraine, then occupied by the French, and secured the adhesion of the Lorraine troops to himself; a little after this he succeeded Montecuccoli as general of the imperial army on the Rhine, and was made a field marshal. The chief success of his campaign of 1676 was the capture of Philiburg, after a long and arduous siege. The war continued without decisive result for some time, and the fate of the duchy, which was still occupied by the French, was the subject of endless diplomacy. At the general peace Charles had to accept the hard conditions imposed by Louis XIV., and he never entered into effective possession of his sovereignty. In 1678 he married the widowed queen of Poland, Eleonora Maria of Austria, and for nearly five years thereafter lived quietly at Innsbruck. The Turkish invasion of 1685, the last great effort of the Turks to impose their will on Europe, called Charles into the field again. At the head of a weak imperial army the duke offered the best resistance he could to the advance of the Turks on Vienna. But he had to fall back, contesting every position, and the Turks finally invested Vienna (July 13th, 1683). At this critical moment other powers came to the assistance of Austria, reinforcements poured into Charles’s camp, and John Sobieski, king of Poland, brought 27,000 Poles. Sobieski and Charles had now over 80,000 men, Poles, Austrians and Germans, and on the morning of the 12th of September they moved forward to the attack. By nightfall the Turks were in complete disorder, Vienna was relieved, and the danger was at an end. Soon the victors took the offensive and reconquered part of the kingdom of Hungary. The Germans and Poles went home in the winter, but Charles continued his offensive with the imperialists alone. Olen (Buda) resisted until 1684, but in the campaign of 1685 Neuhausen was taken by storm, and in 1686 Charles was now reinforced by German auxiliaries, resumed the siege of Olen. All attempts to relieve the place were repulsed, and Olen was stormed on the 2nd of September. In the following campaign the Austrians won a decisive victory on the famous battle-ground of Mohacs (August 18th, 1687). In 1689 Charles took the field on the Rhine against the forces of Louis XIV., the enemy of his house. Mainz and Bonn were taken in the first campaign, but Charles in travelling from Vienna to the front died suddenly at Wels on the 18th of April 1690.

His eldest son, Leopold Joseph (1679–1729), at the peace of Ryswick in 1697 obtained the duchy, of which his father had been dispossessed by France, and was the father of Francis Stephen, duke of Lorraine, who became the husband of Maria Theresa (q.v.), and of Charles (Karl Alexander), a distinguished Austrian commander in the wars with Frederick the Great. The duchy was ceded by Francis Stephen to Stanislaus Leszczyński, the dethroned king of Poland, in 1736, Francis receiving instead the grand-duchy of Tuscany.

CHARLES II. [CHARLES LOUIS DE BOURBON] (1799–1883), duke of Parma, succeeded his mother, Maria Luisa, duchess of Lucca, as duke of Lucca in 1824. He introduced economy into the administration, increased the schools, and in 1832 as a reaction against the bigotry of the priests and monks with which his mother had surrounded him, he became a Protestant. He at first evinced Liberal tendencies, gave asylum to the Modenese political refugees of 1831, and was indeed suspected of being a Carbonaro. But his profligacy and eccentricities soon made him the laughing-stock of Italy. In 1842 he returned to the Catholic Church and made Thomas Ward, an English groom, his prime minister, a man not without ability and tact. Charles gradually abandoned all his Liberal ideas, and in 1847 declared himself hostile to the reform方案. The Lucchesi demanded the constitution of 1805, promised them by the treaty of Vienna, and a national guard, but the duke, in spite of the warnings of Ward, refused all concessions. A few weeks later he retired to Modena, selling his life-interest
in the duchy to Tuscany. On the 17th of October Maria Louisa of Austria, duchess of Parma, died, and Charles Louis succeeded to her throne by the terms of the Florence treaty, assuming the style of Charles II. His administration of Parma was characterized by ruinous finance, debts, disorder and increased taxation, and he concluded an offensive and defensive alliance with Austria. But on the outbreak of the revolution of 1848 there were riots in his capital (10th of March), and he declared his readiness to throw in his lot with Charles Albert, the pope, and Leopold of Tuscany, repudiated the Austrian treaty and promised a constitution. Then he again changed his mind, abdicated in April, and left Parma in the hands of a provisional government, whereupon the people voted for union with Piedmont. After the armistice between Charles Albert and Austria (August 1848) the Austrian general Thurn occupied the duchy, and Charles II. issued an edict from Weistrop annulling the acts of the provisional government. When Piedmont attacked Austria again in 1849, Parma was evacuated, but recaptured by General d'Aspre in April.

In May 1849 Charles confirmed his abdication, and was succeeded by his son Charles III. (1823-1854), who, protected by Austrian troops, placed Parma under martial law, inflicted heavy penalties on the members of the late provisional government, closed the university, and instituted a regular policy of persecution. A violent ruler, a drunkard and a libertine, he was assassinated on the 26th of March 1854. At his death his widow Maria Louisa, sister of the comte de Chambord, became regent, during the minority of his son Robert. The duchess introduced some sort of order into the administration, seemed inclined to rule more mildly and discreetly some of her husband's more obnoxious ministers, but the riots of the Mazzinians in July 1854 were repressed with ruthless severity, and the rest of her reign was characterized by political trials, executions and imprisonments, to which the revolutionists replied with assassinations.

CHARLES (ARCHDUKE) 935

CHARLES [Karl Ludwig] (1771-1847), archduke of Austria and duke of Teschen, third son of the emperor Leopold II., was born at Florence (his father being then grand-duke of Tuscany) on the 9th of September 1771. His youth was spent in Tuscany, at Vienna and in the Austrian Netherlands, where he began his career of military service in the war of the French Revolution. He commanded a brigade at Jemeppe, and in the campaign of 1793 distinguished himself at the action of Aldenhoven and the battle of Neerwinden. In this year he became Stattkolor in Belgium and received the army rank of lieutenant field marshal, which promotion was soon followed by that to Feldzeugmeister. In the remainder of the war in the Low Countries he held high commands, and he was present at Fleurus. In 1795 he served on the Rhine, and in the following year was entrusted with the chief control of all the Austrian forces on that river. His conduct of the operations against Jourdan and Moreau in 1796 marked him out at once as one of the greatest generals in Europe. At first falling back carefully and avoiding a decision, he finally marched away, leaving a mere screen in front of Moreau; upon Jourdan he beat him in the battles of Amberg and Wurzburg, and drove him over the Rhine with great loss. He then turned upon Moreau's army, which he defeated and forced out of Germany. For this campaign, one of the most brilliant in modern history, see FRENCH REVOLUTIONARY WARS. In 1797 he was sent to arrest the victorious march of General Bonaparte in Italy, and he conducted the retreat of the over-matched Austrians with the highest skill. In the campaign of 1799 he was once more opposed to Jourdan, whom he defeated in the battles of Osterach and Stokach, following up his success by invading Switzerland and defeating Massena in the (first) battle of Zürich, after which he re-entered Germany and drove the French once more over the Rhine. Ill-health, however, forced him to retire to Bohemia, whence he was soon recalled to undertake the task of checking Moreau's advance on Vienna. The result of the battle of Hohenlinden had, however, for- doomed the attempt, and the archduke had to make the armistice of Steyer. His popularity was now such that the diet of Regensburg, which met in 1802, resolved to erect a statue in his honour and to give him the title of saviour of his country; but Charles refused both distinctions.

In the short and disastrous war of 1805 the archduke Charles commanded what was intended to be the main army, in Italy, but events made Germany the decisive theatre of operations, and the defeats sustained on the Danube neutralized the success obtained by the archduke over Massena in the desperately fought battle of Caldiero. With the conclusion of peace began his active work of army reorganization, which was first tested on the field in 1808. As generalissimo of the army he had been made field marshal two years before. As president of the Council of War and supported by the prestige of being the only general who had proved capable of defeating the French, he promptly initiated a far-reaching scheme of reform, which replaced the obsolete methods of the 18th century, the chief characteristics of the new order being the adoption of the "nation in arms" principle and of the French war organization and tactics. The new army was surprised in the process of transition by the war of 1809, in which Charles commanded in chief; yet even so it proved a far more formidable opponent than the old, and, against the now heterogeneous army of which Napoleon disposed (see NAPOLEONIC CAMPAIGNS) it succumbed only after a desperate struggle. Its initial successes were neutralized by the reverses of Abensberg, Landshut and Eckmühl; but, after the evacuation of Vienna, the archduke won the great battle of Aspern-Essling (q.v.) and soon afterwards fought the still more desperate battle of Wagram (q.v.), at the close of which the Austrians were defeated but not routed; they had inflicted upon Napoleon a loss of over 50,000 men in the two battles. At the end of the campaign the archduke gave up all his military offices, and spent the rest of his life in retirement, except a short time in 1815, when he was governor of Mainz. In 1822 he succeeded to the duchy of Saxe-Teschen. The archduke Charles married, in 1815, Princess Henrietta of Nassau-Weilburg (d. 1829). He had four sons, the eldest of whom, the archduke Albert (q.v.) became one of the most celebrated generals in Europe, and two daughters, the elder of whom became queen of Naples. He died at Vienna on the 30th of April 1847. An equestrian statue was erected to his memory in Vienna, 1866.

The caution which the archduke preached so earnestly in his strategic works, he displayed in practice only when the situation seemed to demand it, though his education certainly prejudiced him in favour of the defensive at all costs. He was at the same time capable of forming and executing the most daring offensive strategy, and his tactical skill in the handling of troops, whether in wide turning movements, as at Würzburg and Zürich, or in masses, as at Aspern and Wagram, was certainly equal to that of any leader of his time, Napoleon only excepted. The campaign of 1796 is considered almost faultless. That he sustained defeat in 1809 was due in part to the great numerical superiority of the French and their allies, and in part to the condition of his newly reorganized troops. His six weeks' inaction after the victory of Aspern is, however, open to unfavourable criticism. As a military writer, his position in the evolution of the art of war is very important, and his doctrines had naturally the greatest weight. Nevertheless they cannot but be considered as antiquated even in 1806. Caution and the importance of "strategic points" are the chief features of his system. The rigidity of his geographical strategy may be gathered from the prescription that "this principle is never to be departed from." Again and again he repeats the advice that nothing should be hazarded unless one's army is completely secure, a rule which he himself neglected with such brilliant results in 1796. "Strategic points," he says (not the defeat of the enemy's army), "decide the fate of one's own country, and must
CHARLES (CARDINAL)—CHARLES OF VALOIS

constantly remain the general's main solicitude "—a maxim which was never more remarkably disproved than in the war of 1569. The editor of the archduke's work is able to make but a feeble defence against it. Charles's military science was attached more to ground than to the annihilation of the foe. In his tactical writings the same spirit is conspicuous. His reserve in battle is designed to "cover a retreat." The baneful influence of these antiquated principles was clearly shown in the maintenance of Königgrätz-Josefstadt in 1866 as a "strategic point," which was preferred to the defeat of the separated Prussian armies; in the strange plains produced in Vienna for the campaign of 1859, and in the "almost unintelligible" battle of Montebello in the same year. The theory and the practice of the archduke Charles form one of the most curious contrasts in military history. In the one he is real, in the other he displayed, along with the greatest skill, a vivid activity which made him for long the most formidable opponent of Napoleon.

His writings were edited by the archduke Albert and his brother the archduke Carl of Austria, the Ausgezeichnete Schriften weltweit SV. K. Hofeid Erzh. Carl v. Österreich (1862; reprinted 1893, Vienna and Leipzig), which includes the Grundsatze der Kriegskunst für die Generale (1805), Grundsatze der Strategie edulour durch die Darstellung des Feldzugs 1795 (1914), Grundsatze der Kriegskunst für die Generale (1805), Grundsatze der Strategie edulour durch die Darstellung des Feldzugs 1795 (1914). Charles had died at Vienna on January 18, 1742, at the age of forty-three. The son of the Archduchess of Austria, Maria Theresa, he was the successor of his father, Emperor Joseph I. The death of his father in 1740, at the age of forty-four, was a shock to the archduke Charles, who had been deeply attached to him. He was a man of great energy and determination, and his military career was marked by decisive victories. He was the commander-in-chief of the Austrian army during the Seven Years' War, and his success in the battles of Kolin and Leuthen earned him the reputation of a great general.

Charles (1525-1574), cardinal of Lorraine, French statesman, was the second son of Claude of Lorraine, duke of Guise, and brother of Francis, duke of Guise. He was ambassador of Reims in 1538, and cardinal in 1547. At first he was called the cardinal of Guise, but in 1550, on the death of his uncle John, cardinal of Lorraine, he in his turn took the style of cardinal of Lorraine. Brillard, writing in 1599, speaks of all the Guises, devious with ambition and devoid of scruples. He had, said Brillard, "a soul exceeding smirched," and, he adds, "by nature he was exceeding craven." Together with his brother, Duke Francis, the cardinal of Lorraine was all-powerful during the reigns of Henry II. and Francis II.; in 1558 and 1559 he was one of the negotiators of the treaty of Cateau-Cambrésis; he fought and pitilessly persecuted the reformers, and by his intolerant policy helped to provoke the crisis of the wars of religion. The death of Francis II. deprived him of power, but he remained one of the principal leaders of the Catholic party. In 1561, at the Colloquy of Poissy, he was commissioned to reply to Theodore Beza. In 1562 he went to the council of Trent, where he at first defended the rights of the Gallican Church against the pretensions of the pope; but after the assassination of his brother, he approached the court of Rome, and on his return to France he endeavoured, but without success, to obtain the promulgation of the decrees of the council (1562). In 1567, when the Protestants took arms, he held for some time the first place in the king's council, but Catherine de' Medici soon grew weary of his arrogance, and in 1570 he had to leave the court. He endeavoured to regain favour by having the finances of his brother, the archduke Charles, dispensed with the marriage of Henry of Navarre with Margaret of Valois (1572). He died on the 26th of December 1574, at the beginning of the reign of Henry III. An orator of talent, he left several harangues or sermons, among them being Oraison prononcée au Colloque de Poissy (Paris, 1562) and Oratio habitæ in Concil. Trident. (Concil. Trident. Orationes, Louvain, 1567).

A large amount of correspondence is preserved in the Bibliothèque Nationale, Paris. See also René de Bouillé, Histoire des ducs de Guise (Paris, 1849); H. Forneron, Les Guises et le siècle (Paris, 1877); Guillemin, Le Cardinal de Lorraine (1847).

CHARLES [Karl Alexander] (1712-1780), prince of Lorraine, was the youngest son of Leopold, duke of Lorraine, and grandson of Charles V., duke of Lorraine (see above), the famous general. He was born at Lunéville on the 12th of December 1712, and educated for a military career. After his elder brother Francis, the duke, had exchanged Lorraine for Tuscany and married Maria Theresa, Charles became an Austrian officer, and he served in the campaigns of 1737 and 1738 against the Turks. At the outbreak of the Silesian wars in 1740 (see AUSTRIAN SUCCESSION, WAR OF THE), the queen made her brother-in-law a field marshal, though he was not yet thirty years old, and in 1742 Charles encountered Frederick the Great for the first time at the battle of Chotusitz (May 17th). The victory of the Prussians on that field was far from decisive, and Charles drew off his forces in good order. His conduct of the successful campaign of 1743 against the French and Bavarians heightened his reputation. He married, in January 1744, Marianne of Austria, sister of Maria Theresa, who made them jointly governors-general of the Austrian Netherlands. Very soon the war broke out afresh, and Charles, at the head of the Austrian army on the Rhine, won great renown by his brilliant crossing of the Rhine. Once more a Lorraine prince at the head of Austrian troops invaded the duchy and drove the French before him, but at this moment Frederick resumed the Silesian war, all available troops were called back to oppose him, and the French maintained their hold on Lorraine. Charles hurried to the assistance of his brother, Charles the third, prince of Lorraine, and marshal Traun, he quickly expelled the Prussians. At the close of his victorious campaign he received the news that his wife, to whom he was deeply attached, had died in childbirth on the 16th of December 1744 at Brussels. He took the field again in 1745 in Silesia, but this time without the advice of Traun, and he was twice severely defeated by Frederick, at Hohenfriedberg and at Sor. Subsequently, as commander-in-chief in the Low Countries he received, at Roucoux, a heavy defeat at the hands of Marshal Saxe. His government of the Austrian Netherlands during the peace of 1746-1756 was marked by many reforms, and the prince won the regard of the people by his ceaseless activity on their behalf. After the first reverses of the Seven Years' War (q.v.), Maria Theresa called Charles again to the supreme command in the field. The campaign of 1757 opened with Frederick's great victory of Prague, and Prince Charles was shut up with his army in that fortress. In the victory of the relieving army under Daun at Kolin Charles had no part. Nevertheless the battle of Breslau, in which the Prussians suffered a defeat even more serious than that of Kolin, was won by him, and great enthusiasm was displayed in Austria over the victory, which deserved to be the first blow to Frederick. But Charles, turning towards the king of Prussia routed the French at Rossbach, and, swiftly returning to Silesia, he inflicted on Charles the complete and crushing defeat of Leuthen (December 5, 1757). A mere remnant of the Austrian army reassembled after the pursuit, and Charles was relieved of his command. He received, however, from the hands of the empress the grand cross of the newly founded order of Maria Theresa. For a year thereafter Prince Charles acted as a military adviser at Vienna, he then returned to Brussels, where, during the remainder of his life, he continued to govern in the same liberal spirit as before. The affection of the people for the prince was displayed during his dangerous illness in 1765, and in 1775 the estates of Brabant erected a statue in his honour at Brussels. He died on the 4th of July 1780 at the castle of Tervoer, and was buried with his Lorraine ancestors at Nancy.

CHARLES (1720-1735), count of Valois, of Maine, and of Anjou, third son of Philip III., king of France, surnamed the Bold, and of Isabella of Aragon, was born on the 12th of March 1720. By his father's will he inherited the four lordships of Crépy, La Ferrière-Milbert, Pierrefonds and Béthisy, which together formed the county of Valois. In 1724 Martin IV., having excommunicated Pedro III., king of Aragon, offered that kingdom to Charles. King Philip failed in an attempt to place his son on this throne, and died on the return of the expedition. In 1720 Charles married Margaret, daughter of Charles II., king of Naples, and renounced his pretensions to Aragon. In
CHARLES OF VIANA—CHARLES, THOMAS

1294, at the beginning of the hostilities against England, he invaded Guienne and took La Roële and Saint-Sever. During the war Blanders (1300), he took Douai, Béthune and Dam, received the submission of Guy of Dampierre, and aided King Philip IV., the Fair, to gain the battle of Mons-en-Pévèle, on the 18th of August 1304. Asked by Boniface VIII. for his aid against the Ghibellines, he crossed the Alps in June 1301, entered Florence, and helped Charles II., the Lame, king of Sicily, to reconquer Calabria and Apulia from the house of Aragon, but was defeated in Sicily. As after the death of his first wife Charles had married Catherine de Courtenay, a granddaughter of Baldwin II., the last Latin emperor of Constantinople, he tried to assert his rights to that throne. Philip the Fair also wished to get him elected emperor; but Clement V. quashed his candidature in favour of Henry of Luxembourg, afterwards the emperor Henry VII. Under Louis X. Charles headed the party of feudal reaction, and was among those who compassed the ruin of Enguerrand de Marigny. In the reign of Charles IV., the Fair, he fought yet again in Guienne (1324), and died at Perray (Seine-et-Oise) on the 16th of December 1325. His second wife had died in 1307, and in July 1308 he had married a third wife, Mahaut de Châtillon, countess of Saint-Pol. Philip, his eldest son, succeeded to the throne in 1328, and from him his house derived the royal house of Valois.

See Joseph Petit, Charles de Valois (Paris, 1900).

CHARLES (1421–1461), prince of Viana, sometimes called Charles IV. king of Navarre, was the son of John, afterwards John II., king of Aragon, by his marriage with Blanche, daughter and heiress of Charles III., king of Navarre. Both his grandfather Charles and his mother, who ruled over Navarre from 1425 to 1441, had bequeathed this kingdom to Charles, whose right had also been recognized by the Cortes; but when Blanche died in 1441 her husband John seized the government to the exclusion of his son. The ill-feeling between father and son was increased when in 1447 John took for his second wife Joanna Henriquez, a Castilian princess, who soon bore him a son, afterwards Ferdinand I. king of Spain, and who regarded her stepson as an interloper. When Joanna began to interfere in the internal affairs of Navarre civil war broke out; and in 1452 Charles, although aided by John II., king of Castile, was defeated and taken prisoner. Released upon promising not to take the kingly title until after his father's death, the prince, again unsuccessful in an appeal to arms, took refuge in Italy with Alphonso V., king of Aragon, Naples, and Sicily. In 1458 Alphonso died and John became king of Aragon, while Charles was offered the crowns of Naples and Sicily. He declined these proposals, and having been reconciled with his father returned to Navarre in 1459. Aspiring to marry a Castilian princess, he was then thrown into prison by his father, and the Catalans rose in his favour. This insurrection soon became general and John was obliged to yield. He released his son, and recognized him as perpetual governor of Catalonia, and heir to the kingdom. Soon afterwards, however, on the 23rd of September 1461, the prince died at Barcelona, not without a suspicion that he had been poisoned by his stepmother. Charles was a cultured and amiable prince, fond of music and literature. He translated the Ethics of Aristotle into Spanish, a work first published at Saragossa in 1500, and wrote a chronicle of the kings of Navarre, Cronica de los reyes de Navarra, an edition which, edited by J. Yangues and Miranda, was published at Pampeluna in 1843.

See J. de Moret and F. de Aleson, Anales del reyno de Navarra, tome iv. (Pampeluna, 1866); M. J. Quintana, Vidas de españoles célebres (Paris, 1827); and G. Desdevives du Dézert, Cartes d'Aragon (Paris, 1889).

CHARLES, ELIZABETH (1828–1896), English author, was born at Tavistock on the 2nd of January 1828, the daughter of John Rundle, M.P. Some of her youthful poems won the praise of Tennyson, who read them in manuscript. In 1853 she married Andrew Paton Charles. Her best known book, written to order for an editor who wished for a story about Martin Luther, The Chronicles of the Schönberg-Colla Family, was published in 1862, and was translated into most of the European languages, into Arabic, and into many Indian dialects. Mrs Charles wrote in all some fifty books, the majority of a semi-religious character. She took an active part in the work of various charitable institutions, and among her friends and correspondents were Dean Stanley, Archbishop Tait, Charles Kingsley, Jowett and Fusey. She died at Hampstead on the 28th of March 1866.

CHARLES, JACQUES ALEXANDRE CÉSAR (1746–1823), French mathematician and physicist, was born at Beaugency, Loiret, on the 12th of November 1746. After spending some years as a clerk in the ministry of finance, he turned to scientific pursuits, and attracted considerable attention by his skilful and elaborate demonstrations of physical experiments. He was the first, in 1783, to employ hydrogen for the inflation of balloons (see AERONAUTICS), and about 1787 he anticipated Gay Lussac's law of the dilatation of gases with heat, on which that account is sometimes known by his name. In 1788 he was elected to the Academy of Sciences, and subsequently he became professor of physics at the Conservatoire des Arts et Métiers. He died in Paris on the 7th of April 1823. His published papers are chiefly concerned with mathematical topics.

CHARLES, THOMAS (1755–1814), Welsh Nonconformist divine, was born of humble parentage at Longmoor, in the parish of Llanidloes, in the Welsh county of Powis, in the Principality of Wales, in the 18th century. He was educated for the Anglican ministry at Llanddowror in Carnarvonshire, and at Jesus College, Oxford (1775–1778). In 1777 he studied theology under the evangelical John Newton at Olney. He was ordained deacon on 1827 on the title of the curacies of Shepton Beauchamp and Sparkford, Somerset; and took priest's orders in 1780. He afterwards added to his charge at Sparkford, Lovington, South Barrow and North Barrow, and in September 1782 was presented to the perpetual curacy of South Barrow by the Rev. John Hughes, Cohn St Denys. But he never left Sparkford, though the contrary has been maintained, until he resigned all his curacies in June 1783, and returned to Wales, marrying (on August 20th) Sarah Jones of Bala, the orphan of a flourishing shopkeeper. He had early fallen under the influence of the great revival movement in Wales, and at the age of seventeen he had been "converted" by a sermon of Daniel Rowland's. This was enough to make him unpopular with many of the Welsh clergy, and being denied the privilege of preaching for anything but a church funeral, he left friends in the North to care for John Mayor, now vicar of Shawbury, Shropshire, from October 1783 to January 11th, 1784. On the 25th of January he took charge of Llan y Morlwydd (14 m. from Bala), but was not allowed to continue there more than three months. Three influential people, among them the rector of Bala, agitated some of the parishioners against him, and persuaded his rector to dismiss him. His preaching, his cathchizing of the children after evensong, and his connexion with the Bala Methodists—his wife's stepfather being a Methodist preacher—gave great offence. After a fortnight more at Shawbury, he wrote to John Newton and another clergyman friend in London for advice. The Church of England denied him employment, and the Methodists desired his services. His friends advised him to return to England, but it was too late. By September he had crossed the Rubicon, Henry Newman (his rector at Shepton Beauchamp and Sparkford) accompanying him on a tour in Carnarvonshire. In December, he was preaching at the Bont Uchel Association; so that he joined the Methodists (see CALVINISTIC Methodists) in 1784.

Before taking the step, he had often won in his enforced leisure time to gather the poor children of Bala into his house for instruction, and so thickly did they come that he had to adjourn with them to the chapel. This was the origin of the Welsh Circulating Schools, which he developed on the lines adopted by Griffith Jones (d. 1761), formerly vicar of Llanddowror. First one man was trained for the work by himself, then he was sent to a district for six months, where, (for £8 a year) he taught gratis the children and young people (in fact, all comers) reading and Christian principles. Writing was added later. The expenses were met by collections made in the Calvinistic Methodist Societies, and as the funds increased masters were multiplied,
until in 1786 Charles had seven masters to whom he paid £10 per annum; in 1787, twelve; in 1789, fifteen; in 1794, twenty. By this time the salary had been increased to £12; in 1796 it was £14. He had learnt of Raikes’s Sunday Schools before he left the Establishment, but he rightly considered the system set on foot by himself far superior; the work and object being the same, he gave six days’ tuition for every one given by them, and many people not only objected to working as teachers on Sunday, but thought the children forgot in the six days what they learnt on the one. But Sunday Schools were first adopted by Charles to meet the case of young people in service who could not attend during the week, and even in that form much opposition was shown to them because teaching was thought to be a form of Sabbath breaking. His first Sunday School was in 1787. Wilberforce, Charles Grant, John Thornton and his son, Henry, were among the philanthropists who contributed to his funds; in 1798 the Sunday School Society (established 1785) extended its operations to Wales, making him its agent; and Sunday Schools grew rapidly in number and favour. A powerful revival broke out at Bala in the autumn of 1791, and his account of it in letters to correspondents sent without his knowledge to newspapers, kindled a similar fire at Huntly. The scarcity of Welsh bibles was Charles’s greatest difficulty in his work. John Thornton and Thomas Scott helped him to secure supplies from the Society for the Promotion of Christian Knowledge from 1787 to 1789, when the stock became all but exhausted. In 1790 a new edition was brought out by the Society, and he managed to secure 700 copies of the 10,000 issued; the Sunday School Society got 3000 testaments printed, and most of them passed into his hands in 1801.

In 1800, when a frost-bitten thumb gave him great pain and much fear for his life, his friend, Rev. Philip Oliver of Chester, died, leaving him director and one of three trustees over his chapel at Boughton; and this added much to his anxiety. The Welsh causes at Manchester and London, too, gave him much uneasiness, and burdened him with great responsibilities at this juncture. In November 1802 he went to London, and on the 7th of December he sat at a committee meeting of the Religious Tract Society, as a country member, when his friend, Joseph Tuke, a member of the Spa Fields and Religious Tract Society committees—introduced the subject of a regular supply of bibles for Wales. Charles was asked to state his case to the committee, and so forcibly did he impress them, that it was there and then decided to move in the matter of a general dispersion of the bible. When he visited London a year later, his friends were ready to discuss the name of a new Society, and the sole object of which should be to supply bibles. Charles returned to Wales on the 30th of January 1804, and the British and Foreign Bible Society was formally and publicly inaugurated on March the 7th. The first Welsh testament issued by that Society appeared on the 6th of May 1806, the bible on the 7th of May 1807—both being edited by Charles.

Between 1805 and 1811 he issued his Biblical Dictionary in four volumes, which still remains the standard work of its kind in Welsh. Three editions of his Welsh catechism were published for the use of his schools (1789, 1791 and 1794); an English catechism for the use of schools in London (1797); and a Connexion was formed with him in 1797, his short catechism in Welsh appeared in 1790, and passed through several editions, in Welsh and English, before 1807, when his Instructor (still the Connexion catechism) appeared. From April 1790 to December 1801 six numbers of a Welsh magazine called Trysorfa Ysgrydal (Spiritual Treasures) were edited by Thomas Jones of Mold and himself; in March 1800 the first number of the second volume appeared, and the twelfth and last in November 1813.

The London Hibernian Society asked him to accompany Dr. David Bogue, the Rev. Joseph Hughes, and Samuel Mills to Ireland in August 1807, to report on the state of Protestant religion in the country. Their report is still extant, and among the movements initiated as a result of their visit was the Circulating School system. In 1810, owing to the growth of Methodism and the lack of ordained ministers, he led the Connexion into the movement forconnexionally ordained ministers, and his influence was the chief factor in the success of that important step. From 1811 to 1814 his energy was mainly devoted to establishing auxiliary Bible Societies. By correspondence he stimulated some friends in Edinburgh to establish charity schools in the Highlands, and the Gaelic School Society (1811) was his idea. His last work was a corrected edition of the Welsh Bible issued in small pica by the Bible Society. As a preacher he was in great request, though possessing but few of the qualities of the popular preacher. All his work received very small remuneration; the family was maintained by the profits of a business managed by Mrs Charles—a keen, active and good woman. He died on the 5th of October 1814. His influence is still felt, and he is rightly claimed as one of the makers of modern Wales.

(D. E. J.)

CHARLES ALBERT [CARLO ALBERTO] (1798–1849), king of Sardinia (Piedmont), son of Prince Charles of Savoy-Carignano and Princess Albertine of Saxe-Courland, was born on the 2nd of October 1798, a few days before the French occupied Piedmont and forced his cousin King Charles Emmanuel to take refuge in Sardinia. Although Prince and Princess Carignano adhered to the French Republican régime, they soon fell under suspicion and were summoned to France. Charles died in 1807, and his widow married a Count de Monfort and for some years led a wandering existence, chiefly in Switzerland, neglecting her son and giving him mere scraps of education, now under a devotee of J. J. Rousseau, now under a Genevan Calvinist. In 1809 King Charles Emmanuel abdicated in favour of his brother Victor Emmanuel I.; the latter’s only son being dead, his brother Charles Felix was heir to the throne, and after him Charles Albert. On the fall of Napoleon in 1814 the Piedmontese court returned to Turin and the king was anxious to secure the succession for Charles Albert, knowing that Austria meditated excluding him from it in favour of an Austrian archduke, but at the same time he regarded him as an objectionable person on account of his revolutionary upbringing. Charles Albert was summoned to Turin, given tutors to instruct him in legitimist principles, and on the 1st of October 1817 married the archduchess Maria Theresa of Tuscany, who, on the 14th of March 1820, gave birth to Victor Emmanuel, afterwards king of Italy.

The Piedmontese government at this time was most reactionary, and had made a clean sweep of all French institutions. But there were strong Italian nationalists and anti-Austrian tendencies among the younger nobles and army officers, and the Carbonari and other revolutionary societies had made much progress.

Their hopes centred in the younger Carignano, whose agreeable manners had endeared him to all, and who had many friends among the Liberals and Carbonari. Early in 1820 a revolutionary movement was set on foot, and vague plans of combined risings all over Italy and a war with Austria were talked of. Charles Albert no doubt was aware of this, but he never actually became a Carbonaro, and was surprised and startled when after the outbreak of the Neapolitan revolution of 1820 some of the leading conspirators in the Piedmontese army, including Count Santorre di Santarosa and Count San Marzano, informed him that a military rising was ready and that they counted on his help (March 1821). He induced them to delay the outbreak and informed the king, requesting him, however, not to punish anyone. On the 10th the garrison of Alessandria mutinied, and two days later Turin was in the hands of the insurgents, the people demanding the Spanish constitution. The king at once abdicated and appointed Charles Albert regent. The latter, pressed by the revolutionists and abandoned by his ministers, granted the constitution and sent to inform Charles Felix, who was now king, of the occurrence. Charles Felix, who was then at Modena, repudiated the regent’s acts, accepted Austrian military assistance, with which the rising was easily quelled, and exiled Charles Albert to Florence. The young prince found himself the most unpopular man in Italy, for while the Liberals looked on him as a traitor, to the king and the Conservatives he was a dangerous revolutionary. At the Congress of Verona (1822) the Austrian chancellor, Prince Metternich, tried to induce Charles Felix to set aside Charles Albert’s rights of succession.
But the king was piqued by Austria’s interference, and as both the grand-duke of Tuscany and the duke of Wellington supported him, Charles Albert’s claims were respected. France having decided to intervene in the Spanish revolution on the side of autonomy, Charles Albert asked permission to join the duc d'Angoulême’s expedition. The king granted it and the young prince set out for Spain, where he fought with such gallantry at the storming of the Trocadero (1st of September 1823) that the French soldiers proclaimed him the “first Grenadier of France.” But it was not until he had signed a secret undertaking binding himself, as soon as he ascended the throne, to place himself under the tutelage of a council composed of the higher clergy and the knights of the Annunziata, and to maintain the existing forms of the monarchy (D. Berti, Cesare Alferi, xi. 77, 78), that he was allowed to return to Turin and be forgiven.

On the death of Charles Felix (27th of April 1831) Charles Albert succeeded; he inherited a kingdom without an army, with an empty treasury, a chaotic administration and medieval laws. His first task was to set his house in order; he reorganized the finances, created the army, and started Piedmont on a path which if not liberalism was at least progress. “He was,” wrote his reactionary minister, Count della Margherita, “hostile to Austria from the depths of his soul and full of illusions as to the possibility of freeing Italy from dependence on her. . . . As for the revolutionaries, he detested them but feared them, and was convinced that sooner or later he would be their victim.” In 1833 a conspiracy of the Giovane Italia Society, organized by Mazzini, was discovered, and a number of its members punished with ruthless severity. On the election in 1846 of Pius IX., who appeared to be a Liberal and an Italian patriot, the eyes of all Italy were turned on him as the heaven-born leader who was to rescue the country from the foreigner. This to some extent reconciled the king to the Liberal movement, for it accorded with his religious views. “I confess,” he wrote to the marquis of Villamarina, in 1847, “that a war of national independence which should have for its object the defence of the pope would be the greatest happiness that could befall me.” On the 30th of October he issued a decree granting wide reforms, and when risings broke out in other parts of Italy early in 1848 and further liberties were demanded, he was at last induced to grant the constitution (8th February).

When the news of the Milanese revolt against the Austrians reached Turin (19th of March) public opinion demanded that the Piedmontese should succour their struggling brothers; and after some hesitation the king declared war on the Austrians, which had been wasted and many precious opportunities lost. With an army of 60,000 Piedmontese troops and 30,000 men from other parts of Italy the king took the field, and after defeating the Austrians at Pastrengo on the 30th of April, and at Goito on the 30th of May, where he was himself slightly wounded, more time was wasted in useless operations. Radetzky, the Austrian general, having received reinforcements, drove the centre of the extended Italian line back across the Mincio (23rd of July), and in the two days’ fighting at Custozza (24th and 25th of July) the Piedmontese were beaten, forced to retreat, and to ask for an armistice. On re-entering Milan Charles Albert was badly received and reviled as a traitor by the Republicans, and although he declared himself ready to die defending the city the municipality treated with Radetzky for a capitulation; the mob, urged on by the demagogues, made a savage demonstration against him at the Palazzo Greppi, whence he escaped in the night with difficulty and returned to Piedmont with his defeated army. The French Republic offered to intervene in the spring of 1848, but Charles Albert did not desire foreign aid, the more so as in this case it would have had to be paid for by the cession of Nice and Savoy. The revolutionary movement throughout Italy was breaking down, but Charles Albert felt that while he possessed an army he could not abandon the Lombards and Venetians, and determined to stake all on a last chance. On the 12th of March 1849 he denounced the armistice and took the field again with an army of 80,000 men, but gave the chief command to the Polish general Chrzanowski. General Ramorino commanding the Lombard division proved unable to prevent the Austrians from crossing the Ticino (20th of April), and Chrzanowski was completely out-generalled and defeated at La Bicocca near Novara on the 23rd. The Piedmontese fought with great bravery, and the unhappy king sought death in vain. After the battle he asked terms of Radetzky, who demanded the occupation by Austria of a large part of Piedmont and the heir to the throne as a hostage. Thereupon, feeling himself to be the obstacle to better conditions, Charles Albert abdicated in favour of his son Victor Emmanuel. That same night he departed alone and made his way to Oporto, where he retired into a monastery and died on the 28th of July 1849.

Charles Albert was not a man of first-rate ability; he was of a hopelessly vacillating character. Devout and mystical to an almost morbid degree, hating revolution and distrusting Liberalism, he was a Carlo Alberto, a pessimist, yet he had many noble qualities: he was brave to the verge of foolhardiness, devoted to his country, and ready to risk his crown to free Italy from the foreigner. To him the people of Italy owe a great debt, for if he failed in his object he at least materialized the idea of the Risorgimento in a practical shape, and the charges which the Republicans and demagogues brought against him were monstrously unjust.

BIBLIOGRAPHY.—Besides the general works on modern Italy, see the Marquis Costa de Beauregard’s interesting volumes La Jeunesse des Italiens de Charles Albert (Paris, 1849), based on the king’s letters and the journal of Sylvain Costa, a celebrated essayist, the author’s father; the author’s own life of the king, in a very illuminating essay: Domenico Perrone, Gli Ultimi Reali di Savoia (Turin, 1889); L. Cappelletti, Storia di Carlo Alberto (Rome, 1891); Nicomede Bianchi, Storia della diplomazia europea in Italia (8 vols., Turin, 1885–91), a most important work of a general character, and the same author’s Scritti e lettere di Carlo Alberto (Rome, 1879); his and his Storia della monarchia piemontese (Turin, 1877); Count S. della Margherita, Memoria di storico politico (Turin, 1851).

CHARLES AUGUSTUS [KARL AUGUST] (1755–1828), grand-duke of Saxe-Weimar, son of Constantine, duke of Saxe-Weimar-Eisenach, and Anna Amalia of Brunswick, was born on the 3rd of September 1757. His father died when he was only nine months old, and the boy was brought up under the regency and supervision of his mother, a woman of enlightened but masterful temper. His governor was Count Eustach von Görz, a German nobleman of the old strait-laced school; but a more humane element was introduced into his training when, in 1771, Prince Detmar von Knebel came to Weimar as tutor. The poet Karl Ludwig von Knebel came to Weimar as tutor to the young Prince Constantine; and in the same year the two princes set out, with Count Götz and Knebel, for Paris. At Frankfort, Knebel introduced Karl August to the young Goethe: the beginning of a momentous friendship. In 1775 Karl August returned to Weimar, and the same year came of age and married Princess Louise of Hesse-Darmstadt.

One of the first acts of the young grand-duke was to summon Goethe to Weimar, and in 1776 he was made a member of the privy council. “People of discretion,” he said, “congratulate me on possessing this man. His intellect, his genius is known. It makes no difference if the world is offended because I have made Dr Goethe a member of my most important collegium without his having passed through the usual stages of minister official professor and councillor of state.” To the undiscerning the beneficial effect of this appointment was not at once apparent. With Goethe the “storm and stress” spirit descended upon Weimar, and the stiff traditions of the little court dissolved in a riot of youthful exuberance. The duke was a deep drinker, but also a good sportsman; and the revels of the court were alternated with break-neck rides across country, ending in nights spent round the camp fire under the stars. Karl August, however, had more serious tastes. He was interested in literature, in art, in science; critics, unsuspected of flattery, praised his judgment in painting; biologists found in him an expert in anatomy. Nor did he neglect the government of his little state. His reforms were the outcome of something more than the spirit of the
“enlightened despot” of the 18th century; for from the first he realized that the powers of the prince to play “earthly providence” were strictly limited. His aim, then, was to educate his people to work out their own political and social salvation, the object of education being in his view, as he explained later to the dismay of Metternich and his school, to help men to “independence of judgment.” To this end Herder was summoned to Weimar to reform the educational system; and it is little wonder that, under a patron so enlightened, the university of Jena attained the zenith of its fame, and Weimar became the intellectual centre of Germany.

Meanwhile, in the affairs of Germany and of Europe the character of Karl August gave him an influence out of all proportion to his position as a sovereign prince. He had early faced the problem presented by the decay of the Empire, and began to work for the unity of Germany. The plans of the emperor Joseph II., which threatened to absorb a great part of Germany into the heterogeneous Habsburg monarchy, threw him into the arms of Prussia, and he was the prime mover in the establishment of the league of princes (Fürstenbund) in 1785, by which, under the leadership of Frederick the Great, Joseph’s intrigues were frustrated. He was, however, under no illusion as to the power of Austria, and he wisely refused the offer of the Hungarian crown, made to him in 1787 by Prussia at the instance of the Magyar malcontents, with the dry remark that he had no desire to be another “Winter King.” In 1788 Karl August took service in the Prussian army as major-general in active command of a regiment. As such he was present, with Goethe, at the cannonade of Valnay in 1792, and in 1794 at the siege of Mainz and the battles of Pirmasens (September 14) and Kaiserslautern (October 28-30). After this, dissatisfied with the attitude of the powers, he resigned; but rejoined on the accession of his friend King Frederick William III. to the Prussian throne. The disastrous campaign of Jena (1806) followed; on the 14th of October, the day after the battle, Weimar was sacked; and Karl August, to prevent the confiscation of his territories, was forced to join the Confederation of the Rhine. From this time till after the Moscow campaign of 1812 his contingent fought under the French flag in all Napoleon’s wars. In 1813, however, he joined the Grand Alliance, and at the beginning of 1814 took the command of a corps of 50,000 men operating in the Netherlands.

At the congress of Vienna Karl August was present in person, and protested vainly against the narrow policy of the powers in confining their debates to the “rights of the princes” to the exclusion of the “rights of the people.” His services in the war of liberation were rewarded with an extension of territory and the title of grand-duke; but his liberal attitude had already made him suspect, and his subsequent action brought him still further into antagonism with the reactionary powers. He was the first of the German princes to grant a liberal constitution to his state under Article XXIII. of the Act of Confederation (May 5, 1816); and his concession of full liberty to the press made Weimar for a while the focus of journalistic agitation against the existing order. Metternich dubbed him contemptuously “der Kommadant der Burschenschaften;” and the celebrated “festival” held at the Wartburg by his permission in 1818, though in effect the mildest of political demonstrations, brought down upon him the wrath of the great powers. Karl August, against his better judgment, was compelled to yield to the remonstrances of Prussia, Austria and Russia; the liberty of the press was again restricted in the grand-duchy, but, thanks to the good understanding between the grand-duke and his people, the régime of the Carlsbad Decrees pressed less heavily upon Weimar than upon other German states.

Karl August died on the 14th of June 1828. Upon his contemporaries of the most various types his personality made a great impression. Karl von Dalberg, the prince-primate, who owed the coadjutorship of Mainz to the duke’s friendship, said that he had never met a prince “with so much understanding, character, frankness and true-heartedness;” the Milanese, when he visited their city, called him the “uomo principe;” and Goethe himself said of him “he had the gift of discriminating intellects and characters and setting each one in his place. He was inspired by the noblest good-will, the purest humanity, and with his whole soul desired only what was best. There was in him something of the divine. He would gladly have wrought the happiness of all mankind. And finally, he was greater than his surroundings. . . . Everywhere he himself saw and judged, and in all circumstances his surest foundation was in himself.” He left two sons: Charles Frederick (d. 1853), by whom he was succeeded, and Bernhard, duke of Saxe-Weimar (1792-1862), a distinguished soldier, who, after the congress of Vienna, became colonel of a regiment in the service of the king of the Netherlands, distinguished himself as commander of the Dutch troops in the Belgian campaign of 1830, and from 1847 to 1850 held the command of the forces in the Dutch East Indies. Bernhard’s son, William Augustus Edward, known as Prince Edward of Saxe-Weimar (1823–1902), entered the British army, served with much distinction in the Crimean War, and became colonel of the 1st Life Guards and a field marshal; in 1857 he contracted a morganatic marriage with Lady Augusta Gordon-Lennox (d. 1904), daughter of the 5th duke of Richmond and Gordon, who in Germany received the title of countess of Dornburg, but was granted the rank of princess in Great Britain by royal decree in 1866. Karl August’s only daughter, Caroline, married Frederick Louis, hereditary grand-duke of Mecklenburg-Schwerin, and was the mother of Helene (1814–1858), wife of Ferdinand, duke of Orleans, eldest son of King Louis Philippe.

Karl August’s correspondence with Goethe was published in 2 vols. at Weimar in 1863. See the biography by von Wegeler in the Allgemeine Biographie.

CHARLES EDWARD [CHARLES EDWARD LOUIS PHILIP CASMIR STUART] (1720–1788), English prince, called the “Young Pretender” and also the “Young Chevalier,” was born at Rome on December 31st, 1720. He was the grandson of King James II. of England and elder son of James, the “Old Pretender,” by whom (as James III.) he was created at his birth prince of Wales, the title he bore among the English Jacobites during his father’s lifetime. The young prince was educated at his father’s miniature court in Rome, with James Murray, Jacobite earl of Dunbar, for his governor, and under various tutors, amongst whom were the learned Chevalier Ramsay, Sir Thomas Sheridan and the abbé Légoix. He quickly became conversant with the English, French and Italian languages, but all his extant letters written in English appear singularly ill-spelt and illiterate. In 1734 his cousin, the duke of Liria, afterwards duke of Berwick, who was proceeding to join Don Carlos in his struggle for the crown of Naples, passed through Rome. He offered to take Charles on his expedition, and the boy of thirteen, having been appointed general of artillery by Don Carlos, shared with credit the dangers of the successful siege of Gaeta.

The handsome and accomplished youth, whose doings were eagerly reported by the English ambassador at Florence and by the spy John Walton, at Rome, was now introduced by his father and the pope to the highest Italian society, which was fascinated by the frankness of his manner and the grace and dignity of his bearing. In 1737 James despatched his son on a tour through the chief Italian cities, that his education as a prince and man of the world might be completed. The distinction with which he was received on his journey, the royal honours paid to him in Venice, and the jealous interference of the English ambassador in regard to his reception by the grand-duke of Tuscany, show how great was the respect in which the exiled house was held at this period by foreign Catholic powers, as well as the watchful policy of England in regard to its fortunes. The Old Pretender himself calculated upon foreign aid in his attempts to restore the monarchy of the Stuarts; and the idea of rebellion unassisted by invasion or by support of any kind from abroad was one which it was left for Charles Edward to endeavour to realize. Of all the European nations France was the one on which Jacobite hopes mainly rested, and the warm
sympathy which Cardinal Tencin, who had succeeded Fleury as French minister, felt for the Old Pretender resulted in a definite scheme for an invasion of England to be timed simul-
taneously with a prearranged Scottish rebellion. Charles
was secretly despatched to Paris in January 1744. A squadron
under Admiral Roquefeuil sailed from the coast of France.
Transports containing 7000 troops, to be led by Marshal Saxe,
accompanied by the young prince, were in readiness to set sail
for England. A severe storm effected, however, a complete
disaster without any actual engagement taking place.

The loss in ships of the line, in transports, and in lives was a
crushing blow to the hopes of Charles, who remained in France
for over a year in a retirement which he keenly felt. He had
at Rome already made the acquaintance of Lord Elcho and of
John Murray of Broughton; at Paris he had seen many sup-
pporters of the Stuart cause; he was aware that in every European
court the Jacobites were represented in earnest intrigue; and
he had now taken a considerable share in correspondence and
other actual work connected with the promotion of his own and
his father's interests. Although dissuaded by all his friends,
on the 13th of July, 1745 he sailed from Dunkirk aboard the
brig "La Doutelle," which was accompanied by a French
man-of-war, the "Elisabeth," laden with arms and ammunition.
The latter fell in with an English man-of-war, the
"Lion," and had to return to France; Charles escaped during
the engagement, and at length arrived on the 2nd of August
off Eriska, a little island of the Hebrides. Receiving, however,
a cool reception from Macdonald of Boisdale, he set sail again
and arrived at the bay of Lochmaraugh on the west coast of
Inverness-shire.

The Macdonalds of Clanranald and Kinloch Moidart, along
with other chieftains, again attempted to dissuade him from the
 rashness of an unaided rising, but they yielded at last to the
enthusiasm and charm of his manner, and Charles landed on
Scottish soil in the company of the "Seven Men of Moidart"
who had come with him from France. Everywhere, however,
he met with discouragement among the chiefs, whose adherence
he wished to secure; but "at last, by enlisting the support of
Cameroun of Lochiel, he gained a footing for a serious rebellion.
With secrecy and speed communications were entered into with
the known leaders of the Highland clans, and on the 19th of
August, in the valley of Glenfinnan, the standard of James III.
and VIII. was raised in the midst of a motley but increasing
crowd. On the same day Sir John Cope at the head of 1500 men
left Edinburgh in search of Charles; but, fearing an attack in
the Pass of Corryvreck, he changed his proposed route to
Inverness, and Charles thus had the undefended south country
before him. In the beginning of September he entered Perth,
having gained numerous accessions to his forces on his march.
Crossing the Forth unopposed at the Fords of Frew and passing
through Stirling and Linlithgow, he arrived within a few miles of
the astonished metropolis, and on the 10th of September a
body of his skirmishers defeated the dragoons of Colonel Gardiner
in what was known as the "Canter of Coldbrig." His success
was still further augmented by his being enabled to enter the
city, a few of Cameron's Highlanders having on the following
morning, by a happy ruse, forced their way through the Canon-
gate. On the 18th he publicly proclaimed himself King III. of Scot-
land at the Market Cross and occupied Holyrood.

Cope had by this time brought his disappointed forces by sea
to Dunbar. On the 20th Charles met and defeated him at
Prestonpans, and returned to prosecute the siege of Edinburgh
Castle, which, however, he raised on General Guest's threatening
to lay the city in ruins. In the beginning of November Charles
left Edinburgh, never to return. He was at the head of at least
6000 men; but the ranks were being gradually thinned by the
desertion of Highlanders, whose traditions had led them to
consider war merely as a raid and an immediate return with
plunder. Having passed through Kelso, on the 9th of November
he laid siege to Carlisle, which capitulated in a week.
Manchester
received the prince with a warm welcome and with 150 recruits
under Francis Townley.

On the 4th of December he had reached

CHARLES EDWARD
proclaimed their ignorance. In 1750, and again, it is thought, in 1754, he was in London, hatching futile plots and risking his safety for his hopeless cause, and even abjuring the Roman Catholic faith in order to further his political interests.

During the next ten years of his life Charles Edward's illicit connexion with Miss Clementina Walkinshaw (d. 1802), whom he had first met at Bannockburn House while conducting the siege of Stirling, his imperious fretful temper, his drunken habits and debauched life, could no longer be concealed. He wandered over Europe in disguise, alienating the friends and crushing the hopes of his party; and in 1766, on returning to Rome at the death of his father, he was treated by Pope Clement XIII. with coldness, and his title as heir to the British throne was openly repudiated by all the great Catholic powers. It was probably through the influence of the French court, still intriguing against England, that the marriage between Charles (now self-styled count of Albany) and Princess Louise of Stolberg was arranged in 1772. The union proved childless and unhappy, and in 1780 the couple fled for refuge from her husband's drunken violence to a convent in Florence, where Charles had been residing since 1774. Later the couple returned to Rome, the formal separation between the ill-matched pair was finally brought about in 1784, chiefly through the kind offices of King Gustavus III. of Sweden. Charles, lonely, ill, and evidently near death, now summoned to Florence his natural daughter, Charlotte Stuart, the child of Clementina Walkinshaw, born at Liège in October 1753 and hitherto neglected by the prince. Charlotte Stuart, who was declared legitimate and created duchess of Albany, tended her father for the remaining years of his life, during which she contrived to reconcile the two Stuart brothers, so that in 1785 Charles returned to Rome, where he died in the old Palazzo Muti on the 30th of January 1788. He was buried in his brother's cathedral church at Frascati, but in 1807 his remains were removed to the Grotte Vaticane of St Peter's. His daughter Charlotte survived her father less than two years, dying unmarried at Bologna in November 1789, at the early age of thirty-six.

CHARLES EMMANUEL I. [CARLO EMANUELE] (1562-1630), duke of Savoy, succeeded his father, Emmanuel Philibert, in 1580. He continued the latter's policy of profiting by the rivalry of France and Spain in order to round off and extend his dominions. His three chief objects were the conquest of Genoa, of Saluzzo and of Monferrato. Saluzzo he succeeded in wresting from France in 1588. He intervened in the French religious wars, and also fought with Bern and other Swiss cantons, and on the murder of Henry III. of France in 1589 he aspired to the French throne on the strength of the claims of his wife Catherine, sister of Henry of Navarre, afterwards King Henry IV. In 1590 he sent an expedition to Provenza, in the interest of the Countess of Nevers, and followed it himself later, but the peace of 1593, by which Henry of Navarre was recognized as king of France, put an end to his ambitions. In the war between France and Spain Charles sided with the latter, with varying success. Finally, by the peace of Lyons (1601), he gave up all territories beyond the Rhône, but his possession of Saluzzo was confirmed. He now meditated a further enterprise against Genoa; but his attempt to capture the city by treachery and with the help of Spain (the famous escadole) in 1602 failed completely.

The next few years were filled with negotiations and intrigues with Spain and France which did not lead to any particular result, but on the death in 1612 of Duke Francesco Gonzaga of Mantua, who was lord of Monferrato, Charles Emmanuel made a successful coup de main on that district. This arrayed the Venetians, Tuscany, the Empire and Spain against him, and he was obliged to relinquish his conquest. The Spaniards invaded the duchy from Lombardy, and although the duke was defeated several times he fought bravely, gained some successes, and the terms of the peace of 1618 left him more or less in the status quo ante. We next find Charles Emmanuel aspiring to the imperial crown in 1619, but without success. In 1628 he was in alliance with Spain in the war against France; the French invaded the duchy, which, being abandoned by Spain, was overrun by their armies. The duke fought desperately, but was taken ill at Savignano and died in 1630. He was succeeded by his son Victor Amedeo I., while his third son Tommaso founded the line of Savoy-Carignano from which the present royal house of Italy is descended. Charles Emmanuel achieved a great reputation as a statesman and warrior, and increased the prestige of Savoy, but he was too shifty and ingenuous, and his schemes ended in disaster.

CHARLES MARTEL1 (c. 688—741), Frankish ruler, was a natural son of Pippin II., mayor of the palace, and Chalpana. Charles was baptized by St Rigobert, bishop of Reims. At the death of his father in 714, Pippin's widow Plectrude claimed the government in Austrasia and Neustria in the name of her grandchildren, and had Charles thrown into prison. But the Neustrians threw off the Austrasian yoke and entered into an offensive alliance with the Frisians and Saxons. In the general anarchy Charles succeeded in escaping, defeated the Neustrians at Ambleve, south of Liège, in 716, and at Vincy, near Cambrai, in 717, and forced them to come to terms. In Austrasia he wrested the power from Plectrude, and took the title of mayor of the palace, thus prejudicing the interests of his nephews. According to the Frankish custom he proclaimed a king in Austrasia in the person of the young Clotaire IV., but in reality Charles was the sole master—the entry in the annals for the year 717 being "Carolus regnare coepit." Once in possession of Austrasia, Charles sought to extend his dominion over Neustria also. In 718 he defeated Ragenfrid, the Neustrian mayor of the palace, at Stolberg and forced him to retreat; and in 731 Ragenfrid died in 731, and from that time Charles had no competitor in the western kingdom. He obliged the inhabitants of Burgundy to submit, and disposed of the Burgundian bishoprics and counties to his leudes. In Aquitaine Duke Odo (Eudes) exercised independent authority, but in 740 Charles forced him to recognize the suzerainty of northern France, at least nominally. After the alliance between Charles and Odo on the field of Poitiers, the mayor of the palace left Aquitaine to Odo's son Hunald, who paid homage to him. Besides establishing a certain unity in Gaul, Charles saved it from a very great peril. In 711 the Arabs had conquered Spain. In 720 they crossed the Pyrenees, seized Narbonensis, a dependency of the kingdom of the Visigoths, and advanced on Gaul. By his able policy Odo succeeded in arresting their progress for some years; but a new vassl, Abdur Rahman, a member of an extremely fanatical sect, resumed the attack, reached Poitiers, and advanced on Tours, the holy town of Gaul. Thus, in October 732—just 100 years after the death of Mahomet—Charles Emmanuel secured a victory over Angers. Abdur Rahman, who was called back to Africa by the revolts of the Berbers and had to give up the struggle. This was the last of the great Arab invasions of Europe. After his victory Charles took the offensive, and endeavoured to wrest Narbonensis from the Mussulmans. Although he was not successful in his attempt to recover Narbonne (737), he destroyed the fortresses of Agde, Béziers and Maguelonne, and set fire to the amphitheatre at Nimes. He subdued also the Germanic tribes; annexed Frisia, where Christianity was beginning to make progress; put an end to the duchy of Alemannia; intervened in the internal affairs of the dukes of Bavaria; made expeditions into Saxony; and in 738 compelled some of the Saxons to pay him tribute.

1 Or " The Hammer."
He also gave St Boniface a safe conduct for his missions in Thuringia, Alemannia and Bavaria.

During the government of Charles Martel important changes appear to have been made in the internal administration. Under him began the great assemblies of nobles known as the champes de Mars. To attach his leudes Charles had to give them church lands as precarium, and this had a very great influence in the development of the feudal system. It was from the precarium, or ecclesiastical benefice, that the feudal fief originated. Vassalage, too, acquired a greater consistency at this period, and its rules began to crystallize. Under Charles occurred the first attempt at reconciliation between the papacy and the Franks. Pope Gregory III., menaced by the Lombards, invoked the aid of Charles (739), sent him a deputation with the keys of the Holy Sepulchre and the chains of St Peter, and offered to break with the emperor and Constantinople, and to give Charles the Roman consulate (ut a paribus imperatoris recedeter et Romanum consulatum Carolo sanctiore). This proposal, though unsuccessful, was the starting-point of a new papal policy. Since the death of Theuderic IV. in 737 there had been no king of the Franks. In 741 Charles divided the kingdom between his two sons, as though he were himself master of the realm. To the elder, Carloman, he gave Austrasia, Alemannia and Thuringia, with suzerainty over Bavaria; the younger, Pippin, received Neustria, Burgundy and Provence. Shortly after this division of the kingdom Charles died at Quierzy on the 22nd of October 741, and was buried at St Denis. The characters of Charles Martel and his grandson Charlemagne offer many striking points of resemblance. Both were men of courage and activity, and the two men are often confused in the chansons de geste.

See T. BreYSig, Jahrbücher d. fränk. Reichs, 714-741; die Zeit Karl Martells (Leipzig, 1869); A. A. BEUGNT, Sur la spoliation des biens du clergé attribuée à Charles Martel, in the Mem. de l'Acad. des inscriptions et belles-lettres (1904), xix, 549-588.

CHARLESTON, a city and the county-seat of Colles county, Illinois, U.S.A., in the E. part of the state, about 43 m. W. of Terre Haute, Indiana. Pop. (1900) 54,888; (1910) 58,542. It is served by the Cincinnati, Chicago & St. Louis, and the Toledo, St Louis & Western railways, and by interurban electric lines. It is the seat of the Eastern Illinois state normal school (opened in 1890). The city is situated in an important broom-corn raising district, and has broom factories, a tile factory and planing mills. The water-works are owned and operated by the municipality. Charleston was settled about 1835, was incorporated in 1839, and was reincorporated in 1865. One of the Lincoln-Douglas debates was held here in 1858.

CHARLESTON, the largest city of South Carolina, U.S.A., the county-seat of Charleston county, a port of entry, and an important South Atlantic seaport, on a narrow peninsula formed by the Cooper river on the E. and the Ashley on the W. and S.W., and within sight of the ocean about 7 m. distant. Pop. (1890) 34,053; (1900) 55,807, of whom 31,522 were of negro descent and 2592 were foreign-born; (1910 census) 58,833. It is served by the Atlantic Coast Line and the Southern railways, the Interurban Electric Lines, the Long Island Railroad and the Baltimore & Ohio, the Baltimore & Carolina Steamship Co. to Baltimore and Georgetown, and a branch of the North German Lloyd Steamship Co., which brings immigrants from Europe direct to the Southern states; there are freight boat lines to ports in the West Indies, Central America and other foreign countries.

The city extends over 3,760 sq. m. of surface, nowhere rising more than 8 or 10 ft. above the rivers, and has about 9 m. of water front. In the middle of the harbour, on a small island near its entrance, is the famous Fort Sumter; a little to the north-east, on Sullivan's Island, is the scarcely less historic Fort Moultrie, as well as extensive modern fortifications; on James Island, opposite, is Fort Johnson, now the United States Quarantine Station, and farther up, on the other islands, are Fort Ripley and Castle Pinckney (now the United States buoy station). Viewed from any of these forts, Charleston's spires and public buildings seem to rise out of the sea. The streets are shaded with the live oak and the linden, and are ornamented with the palmetto; and the quaint specimens of colonial architecture, numerous pillared porticos, spacious verandas—both upper and lower—and flower gardens made beautiful with magnolias, palmettoes, azaleas, jessamines, camellias and roses, give the city a peculiarly picturesque character.

King Street, running north and south through the middle of the peninsula, and Market Street, crossing it about 1 m. from its lower end, are lined with stores, shops or stalls; on Broad Street are many of the office buildings and banks; the wholesale houses are for the most part on Meeting Street, the first thoroughfare east of King; nearly all of the wharves are on the east side; the finest residences are at the lower end of the peninsula on East Battery and South Battery, on Meeting Street below Broad, on Legare Street, on Broad Street and on Rutledge Avenue to the west of King. At the south-east corner of Broad and Meeting streets is St Michael's (built in 1752-1761), the oldest church edifice in the city, and a fine specimen of colonial ecclesiastical architecture; in its tower is an excellent chime of eight bells. Beneath the vestry room lie the remains of Charles the Second of Pinckney, and in the churchyard are the graves of John Rutledge, James Louis Petigru and Robert Young Hayne. At the intersection of the same streets are also the massive United States post office building (Italian Renaissance in style), with walls of granite; the county court house, the city hall and Washington Square—in which stand a statue of William Pitt (one arm of which was broken off by a cannon shot during the British bombardment in 1780), and a monument to the memory of Henry Timrod (1826-1867), the poet. At the foot of Broad Street is the Colonial Exchange in which the South Carolina convention organized a new government during the War of Independence; and at the foot of Market Street is the large modern custom house of white marble, built in the Roman-Corinthian style. Saint Philip's church, with admirable architectural proportions, has a steeple nearly 200 ft. in height, from which a beacon light shines for the guidance of mariners far out to sea. In the west cemetery of this church are the tombs of John C. Calhoun, and of Robert James Turnbull (1757-1833), who was prominent locally as a nullifier and under the name of "Brutus" wrote ably on behalf of nullification, free trade and state's rights. The French Protestant Church, though small, is an attractive specimen of Gothic architecture; and the Unitarian, which is in the Perpendicular style and is modelled after the chapel of Edward VI. in Westminster, has a beautiful fan-tracery ceiling.

Of the few small city squares, gardens or parks, the White Point Garden at the lower end of the peninsula is most frequented; it is shaded with beautiful live oaks, is adorned with palmettoes and commands a fine view of the harbour. About 1½ m. north of this on Meeting Street is Marion Square, with a tall graceful monument to the memory of John C. Calhoun on the south side, and the South Carolina Military Academy along the north border. The largest park in Charleston is Hampton Park, named in honour of General Wade Hampton. It is situated in the north-west part of the city and is beautifully laid out. The beach south of Sullivan's Island, has a large pavilion and a wide sandy beach with a fine surf for bathing, and is the most popular resort for visitors. The Magnolia Gardens are about 8 m. up the Ashley. Twenty-two miles beyond is the town of Summerville (pop. in 1900, 24,20), a health resort in the pine lands, with one of the largest tea farms in the country. Magnolia Cemetery, the principal burial-place, is a short distance north of the city limits; it is the graves of William Washington (1732-1810) and Hugh Swinton Legaré. Charleston was the home of the Pinckneys, the Rutledges, the Gadsdens, the Launerens, and, in a later generation, of W. G. Simms. A trace of the early social organization of the brilliant colonial town remains in the St Cecilia Society, first formed in 1737 as an amateur concert society.

Charleston has an excellent system of public schools. Foremost among the educational institutions is the college of Charleston, chartered in 1785 and again in 1791, and opened in 1790;
it is supported by the city and by funds of its own, ranks high within the state, and has a large and well-equipped museum of natural history, probably founded as early as 1777 and transferred to the college in 1850. Here, too, are the Medical College of the state of South Carolina, which includes a department of pharmacy; the South Carolina Military Academy (opened in 1843), which is a branch of the University of South Carolina; the Porter Military Academy (Protestant Episcopal), the Confederate home school for young women, the Charleston University School, and the Avery Normal Institute (Congregationalist) for coloured students. In the Charleston library (about 25,000 volumes), founded in 1748, are important collections of rare books and manuscripts; the rooms of the South Carolina Historical Society are in the same building. The Charleston News and Courier, published first as the Courier in 1803 and combined with the Daily News (1865) in 1873, is one of the most influential newspapers in the South. The charitable institutions of the city include the Roper hospital, the Charleston Orphan Asylum (founded in 1792), the William Euston home for the aged, and a home for the widows of Confederate soldiers.

In 1878 the United States government began the construction of jetties to remove the bar at the entrance to Charleston harbour, which was otherwise deep and spacious and well protected, and by means of these jetties the bar has been so far removed as to admit vessels drawing about 30 ft. of water. The result has been not only the promotion of the city's commerce, but the removal of the United States naval station and navy yard from Port Royal to what was formerly Chicora Park on the left bank of the Cooper river, a short distance above the city limits. The city's commerce consists largely in the export of cotton, 1 rice, fertilizers, fruits, lumber and naval stores; the value of its exports, $10,794,000 in 1897, decreased to $2,196,506 in 1907 ($3,164,085 in 1908), while that of its import trade ($1,255,483 in 1897) increased to $3,340,585 in 1907 ($3,324,844 in 1908). The principal industries are the preparation of fertilizers—largely from the extensive beds of phosphate rock along the banks of the Ashley river and from cotton-seed meal—cotton compressing, rice milling, canning oysters, fruits and vegetables, and the manufacture of cotton bagging, of lumber, of cooperage goods, clothing and carriages and wagons. Between 1880 and 1890 the industrial development of the city was very rapid, the manufactures in 1890 showing an increase of 220-6% over those of 1880; the increase between 1890 and 1900 was only 6-2%. In 1900 the total value of the city's manufactures, 163% (in value) of the product of the entire state, was $9,562,387, the value of the fertilizer product alone, much the most important, being $3,067,000.2

History.—The first English settlement in South Carolina, established at Albemarle Point on the west bank of the Ashley river in 1670, was named Charles Town in honour of Charles II. The location proving undesirable, a new Charles Town on the site of the present city was begun about 1672, and the seat of government was removed to it in 1680. The name Charles Town became Charlestown about 1719 and Charleston in 1783. Among the early settlers were English, Scotch and Irish Presbyterians, Scotch and German Luthers, Huguenots (especially in 1680-1688) from France and Switzerland, and a few Quakers; later the French element of the population was augmented by settlers from Acadia (1755) and from San Domingo (1793). Although it soon became the largest and the wealthiest settlement south of Philadelphia, Charleston did not receive a charter until 1783, and did not have even a township government. Local ordinances were passed by the provincial legislature and enforced partly by provincial officials and partly by the chairmen of wards.

It was, however, the political and social centre of the province, being not only the headquarters of the governor, council and colonial officials, but also the only place at which courts of justice were held until the complaints of the Up Country people led to the establishment of circuit courts in 1722. After the American War of Independence it continued to be the capital of South Carolina until 1790. The charter of 1783, though frequently amended and altered, is still in force. By an act of the state legislature passed in 1837 the terms "mayor" and "alderman" superseded the older terms "intendant" and "wardens." The city was the heart of the nullification movement of 1832-1833; and in St Andrew's Hall, in Broad Street, on the 20th of December 1860, a convention called by the state legislature passed an ordinance of secession from the Union.

Charleston has several times been attacked by naval forces and has suffered from many storms. Hurricane and epidemic together devastated the town both in 1699 and in 1854; the city was an annual market before the town was burnt in 1740, and a hurricane did great damage in 1752. In 1706, during the War of the Spanish Succession, a combined fleet of Spanish and French under Captain Le Febvre was repulsed by the forces of Governor Nathaniel Johnson (d. 1715) and Colonel William Rhett (1666-1721). During the War of Independence Charleston withstood the attack of Sir Peter Parker and Sir Henry Clinton in 1776, and that of General Augustus Prevost in 1779, but shortly afterwards became the objective of a more formidable attack by Sir Henry Clinton, the commander-in-chief of the British forces in America. In the later years of the contest the British turned their attention to the reduction of the colonies in the south, and the prominent point and best base of operations in that section was the city of Charleston, which was occupied in the latter part of 1779 by an American force under General Benjamin Lincoln. In December of that year Sir Henry Clinton embarked from New York with two British troops and proceeded to invest Charleston by land. He entrenched himself west of the city between the Cooper and Ashley rivers, which bound it north and south, and thus hemmed Lincoln in a cul-de-sac. The latter made the mistake of attempting to defend the city with an inferior force. Delays had occurred in the British operations and Clinton was not prepared to summon the Americans to surrender until the 10th of April 1780. Lincoln refused, and Clinton advanced his trenches to the third parallel, rendering his enemy's works untenable. On the 12th of May Lincoln capitulated. About 2000 American Continentals were made prisoners, and an equal number of militia and armed citizens. This success was regarded by the British as an offset against the loss of Burgoyne's army in 1777, and Charleston at once became the base of active operations in the Carolinas, which Clinton left Cornwallis to conduct. Thenceforward Charleston was under military rule until evacuated by the British on the 14th of December 1782.

The British garrison under General Lord Cornwallis, in Fort Sumter (garrisoned by Federal troops) by the South Carolina legislature on the 13th of April 1861, marked the actual beginning of the American Civil War. * From 1862 onwards Charleston was more or less under siege by the Federal naval and military forces until 1865. The Confederates repulsed a naval attack made by the Federales under Admiral S. F. Du Pont in April 1863, and a land attack under General Q. A. Gillmore in June of the same year. They were compelled to evacuate the city on the 17th of February 1865, after having burned a considerable amount of cotton and other supplies to prevent them from falling into the hands of the enemy. After the Civil War the wealth and the population steadily increased, in spite of the destruction wrought by the earthquake of 31st August 1886 (see EARTHQUAKE). In that catastrophe 27 persons were killed, many more were injured and died subsequently, 90% of the buildings were injured, and property to the value of more than $5,000,000 was destroyed. The South Carolina Interstate and West Indian Exposition, held

1 At an early date cotton became an important article in Charleston's commerce; some was shipped as early as 1749. At the outbreak of the Civil War Charleston was one of the three most important cotton-shipping ports in the United States, being exceeded in importance only by New Orleans and New York.

2 The special census of 1805 dealt only with the factory product, that of 1905 ($6,007,004) showing an increase of 5-1% over that of 1900 ($5,713,315). In 1905 the (factory) fertilizer product of Charleston was $1,291,850, which represented more than 35% of the (factory) fertilizer product of the whole state.
here from the 1st of December 1802 to the 1st of June 1802, called the attention of investors to the resources of the city and state, but was not successful financially, and Congress appropriated $160,000 to make good the deficit.

Much information concerning Charleston may be obtained in A. S. Salley's A Guide and Historical Sketch of Charleston (Charleston, 1902), and in Mrs St Julien Ravenel's Charleston: The Place and the People (New York, 1906). The best history of Charleston is William A. Courtenay's Charleston, S.C.: The Centennial of Incorporation (Charleston, 1884). There is also a good sketch by Yates Snowden in L. P. Powell's Historic Towns of the Southern States (New York, 1900). For the earthquake see the account by Carl McKinley in the Charleston Year-Book for 1886. See also South Carolina.

CHARLESTON, the capital of West Virginia, U.S.A., and the county-seat of Kanawha county, situated near the centre of the state, on the N. bank of the Kanawha river, at the mouth of the Elk river, about 200 m. E. of Cincinnati, Ohio, and about 130 m. S.W. of Wheeling. Pop. (1890) 67,422; (1900) 77,099, of whom 1787 were negroes, and 353 were foreign-born; (1910 census) 29,906. It is served by the Chesapeake & Ohio, the Toledo & Ohio Central, the Coal & Coke, and the Kanawha & West Virginia (39 m. to Blakeley) railways, and by several river transportation lines on the Kanawha river (navigable throughout the year by means of movable locks) connecting with Ohio and Mississippi. The city extends from the level land, above the river; in addition to a fine custom-house, court house and high school, it contains the West Virginia state capitol, erected in 1880. The libraries include the state law library, with 14,000 volumes in 1908, and the library of the state Department of Archives and History, with about 11,000 volumes. Charleston is in the midst of a region rich in bituminous coal, the shipment of which by river and rail constitutes one of its principal industries. Oil wells in the vicinity also furnish an important product for export, and there are iron and salt mines near. An ample supply of natural gas is utilized by its manufacturing establishments; and among its manufactures are axes, lumber, foundry and machine shop products, furniture, boilers, woolen goods, glass and chemical fire-engines. The value of the city's factory products increased from $1,261,815 in 1900 to $2,728,074 in 1905, or 116.2%, a rate of increase that of any other city (with 5000 or more inhabitants) in the state during this period. The first permanent white settlement at Charleston was made soon after the close of the War of Independence; it was one of the places through which the streams of immigrants entered the Ohio Valley, and it became of considerable importance as a centre of transfer and shipment, but it was not until the development of the coal mining region that it became industrially important. Charleston was incorporated in 1749, and was chartered as a city in 1870. Since the latter year it has been the seat of government of West Virginia, with the exception of the decade 1875-1885, when Wheeling was the capital.

CHARLESTOWN, formerly a separate city of Middlesex county, Massachusetts, U.S.A., but since 1874 a part of the city of Boston, with which it had long been in many respects practically one. It is situated on a small peninsula on Boston harbour, between the mouths of the Mystic and Charles rivers; the first bridge across the Charles, built in 1786, connected Charlestown and Boston. A United States navy yard (1860), occupying about 87 acres, and the Massachusetts state prison (1805) are here; the old burying-ground contains the grave of John Harvard and that of Thomas Beecher, the first American member of the famous Beecher family; and there is a soldiers' and sailors' national cemetery (1863). Charlestown was founded in 1629, and in 1847, when Charlestown was almost completely destroyed by the British. The Bunker Hill Monument commemorates the battle; and the navy yard at Moulton's Point was the landing-place of the attacking British troops. Little was done toward the rebuilding of Charlestown until 1873. The original territory of the township was very large, and from parts of it were formed Woburn (1642), Malden (1649), Stoneham (1725), and Somerville (1842); other parts were annexed to Cambridge, to Medford and to Arlington. S. F. Morse, the inventor of the electric telegraph, was born here; and Charlestown was the birthplace and home of Nathaniel Gorham (1738-1766), a member of the Continental Congress in 1782-1783 and 1785-1787, and its president in 1786; and was the home of Loammi Baldwin (1780-1838), a well-known civil engineer; of Samuel Dexter (1761-1816), an eminent lawyer, secretary of war and for a short time secretary of the treasury in the cabinet of President John Adams; and of Oliver Holden (1765-1831), a composer of hymn-tunes, including "Coronation."

See R. Frothingham, History of Charlestown (Boston, 1845), covering 1629-1725; J. F. Hunnicutt, A Century of Town Life . . . 1775-1807 (Boston, 1888); and Timothy T. Sawyer, Old Charlestown (1902).

CHARLET, NICOLAS TOUSSAINT (1702-1845), French designer and painter, more especially of military subjects, was born in Paris on the 20th of December 1792. He was the son of a dragoon in the Republican army, whose death in the ranks left the widow and orphan in very poor circumstances. Madame Charlet, however, a woman of determined spirit and an extreme Nationalism, resolved to have her son become a moderate education at the Lycée Napoléon, and was repaid with the highest honor. His first employment was in a Parisian mairie, where he had to register recruits: he served in the National Guard in 1814, fought bravely at the Barrière de Cléchy, and, being thus unacceptable to the Bourbon party, was dismissed from the mairie in 1816. He then, having from a very early age had a propensity for drawing, entered the atelier of the distinguished painter Baron Gros, and soon began issuing the first of those lithographed designs which eventually brought him renown. His "Grenadier de Waterloo," 1817, with the motto "La Garde meurt et se rend pas" (a famous phrase frequently attributed to Cambronne, but which he never uttered, and which cannot, perhaps, be traced farther than to this lithograph by Charlet), was particularly popular. It was only towards 1822, however, that he began to be successful in a professional sense. Lithographs (about 2000 altogether), water-colours, sepia-drawings, numerous oil sketches, and a few etchings followed one another rapidly; there were also three exhibited oil pictures, the first of which was especially admired. "Episodes in the Campaign of Russia" (1830), the "Hercules of the Danube" (1837), and "Wounded Soldiers Halting in a Ravine" (1843). Besides the military subjects in which he peculiarly delighted, and which found an energetic response in the popular heart, and kept alive a feeling of regret for the recent past of the French nation and discontent with the present,—a feeling which increased upon the artist himself towards the close of his career,—Charlet designed many subjects of town life and peasant life, the ways of children, &c., with much wit and whim in the descriptive motifs. One of the most famous sets is the "Vie civile, politique, et militaire du Caporal Valentin," 50 lithographs, dating from 1838 to 1842. In 1838 his health began to fail owing to an affection of the chest. He died in Paris on the 30th of October 1845. Charlet was an uncommonly tall man, with an expressive face, bantering and good-natured; his character corresponded, full of boisterous fun and high spirits, with many independence, and a vein of religious feeling, and he was a hearty favourite among his intimates, one of whom was the painter Géricault. Charlet married in 1824, and two sons survived him.

The life of Charlet was published in 1856 by a military friend, De la Couture (W. M. R.)

CHARLEVILLE, a town of north-eastern France, in the department of Ardennes, 153 m. N.E. of Paris on the Eastern railway. Pop. (1906) 16,063. Charleville is situated within a bend of the Meuse on its left bank, opposite Mézières, with which it is united by a suspension bridge. The town was founded in 1666 by Charles III. (Gonzaga), duke of Nevers, afterwards duke of Mantua, and is laid out on a uniform plan: its central and most interesting portion is the Place Ducale, a large square
surrounded by old houses with high-pitched roofs, the porches being arranged so as to form a continuous arcade; in the centre there is a fountain surmounted by a statue of the duke Charles. A handsome church in the Romanesque style and the other public buildings date from the 19th century. An old mill, standing on the bank of the river, dates from the early years of the town's existence. On the right bank of the Meuse is Mont Olympe, with the ruins of a fortress dismantled under Louis XIV. Charleville, which shares with Mêzières the administrative institutions of the department of Ardenne, has tribunals of first instance and of commerce, a chamber of commerce, a board of trade-arbitrators and lycées and training colleges for both sexes. Its chief industries are metal-founding and the manufacture of nails, anvils, tools and other iron goods, and brush-making; leather-working and sugar-refining; and the making of bricks and clay pipes are also carried on.

**Charlevoix, Pierre François Xavier de** (1682–1761), French Jesuit traveller and historian, was born at St Quentin on the 29th of October 1682. At the age of sixteen he entered the Society of Jesus; and at the age of twenty-three was sent to Canada, where he remained for four years as professor at Quebec. He then returned and became professor of belles lettres at home, and travelled on the errands of his society in various countries. In 1770–1772, under orders from the regent, he visited America for the second time, and went along the Great Lakes and down the Mississippi. In later years (1733–1755) he was one of the directors of the Journal de Trévoux. He died at La Flèche on the 1st of February 1761. His works, enumerated in the *Bibliographie des Prêtres de la Compagnie de Jésus* (by Charles Sommervogel), fall into two groups. The first contains his *Histoire de l'établissement, du progrès et de la décadence du christianisme dans l'empire du Japon* (Rouen, 1715; English trans. *History of the Church of Japan*, 1715), and his *Histoire et description générale du Japon* (1736), a compilation chiefly from Kämpfer. The second group includes his historical work on America: *Histoire de l'île Espagnole ou de Saint Domingue* (1750), based on manuscript memoirs of P. Jean-Sauvi des Lettres and original sources; *Histoire de Paraguay* (1756); *Vie de la Mère Marie de l’Incarnation, institutrice et première supérieure des Ursulines de la Nouvelle-France* (1724); *Histoire et description générale de la Nouvelle-France* (1744; in English 1760; tr. J. G. Shea, 1866–1872), a work of capital importance for Canadian history.

**Charlevoix**, a village and the county-seat of Charlevoix county, Michigan, U.S.A., 16 m. E.S.E. of Petoskey, on Lake Michigan and Pine Lake, which are connected by Pine river and Round Lake. Pop. (1890) 1406; (1900) 2070; (1902) 2305; (1910) 2420. It is on the main line of the Pere Marquette railway, and during the summer season is served by lake steamers. The village is best known as a summer resort; it is built on bluffs and on a series of terraces rising from Round and Pine lakes and affording extensive views; and there are a number of attractive summer residences. Charlevoix is an important hardwood lumbering and ship-building town. The chief industries are the manufacturing of lumber and of cement; fishing (especially for lake trout and white fish); the raising of sugar beets; and the manufacture of rustic and fancy wood-work. Charlevoix was settled about 1866, and was incorporated as a village in 1879.

**Charlotte**, a city and the county-seat of Mecklenburg county, North Carolina, U.S.A., situated on Sugar Creek, in the south-west part of the state, about 175 m. south-west of Raleigh. Pop. (1890) 11,557; (1900) 18,091, of whom 7152 were negroes; (1910 census) 34,014. It is served by the Seaboard Air Line and the Southern railways. Among the public buildings are a fine city hall, court-house, Federal and Young Men's Christian Association buildings, and a Carnegie library; several hospitals: St Peter's (Episcopal) for whites, Good Samaritan (Episcopal) for negroes, Mercy General (Roman Catholic) and a Presbyterian. The city is the seat of Elizabeth College and Conservatory of Music (1857), a non-sectarian institution for women, of the Presbyterian College for women, and of Biddle University (Presbyterian) for negroes, established in 1887. There is a United States assay office, established as a branch mint in 1837, during the days of North Carolina's great importance as a gold producing state, and closed from 1861 to 1869. The city has large cotton, clothing, and knitting mills, and manufactories of cotton-seed oil, tools, machinery, fertilizers and furniture. The total value of its factory products was $4,849,630 in 1905. There are large electric power plants in and near the city. Printing and publishing are of some importance: Charlotte is the publication headquarters of the African Methodist Episcopal Zion Church; and several textile trade journals and two medical periodicals are published here. The water-works are owned by the municipality. Charlotte was settled about 1750 and was incorporated in 1768. Here in May 1775 was adopted the "Mecklenburg Declaration of Independence" (see NORTH CAROLINA), and in honour of its signers there is a monument in front of the court-house. Charlotte was occupied in September 1780 by Cornwallis, who left it after learning of the battle of King's Mountain, and subsequently it became the principal base and rendezvous of General Greene.

**Charlottenburg**, a town of Germany, in the kingdom of Prussia, on the Spree, lying immediately west of Berlin, of which it forms practically the entire western suburb. The earlier name of the town was Lietzenburg. Pop. (1890) 76,850; (1900) 189,290; (1905) 237,231. It is governed by a council of 94 members. The central part of the town is connected with Berlin by a magnificent avenue, the Charlottenburger Chaussee, which runs from the Brandenburg Tor through the whole length of the Tiergarten. Although retaining its own municipal government, Charlottenburg, together with the adjacent suburban towns of Schöneberg and Rixdorf, was included in 1900 in the police district of the capital. The Schloss, built in 1696 for the Electress Sophie Charlotte, queen of the elector Frederick, afterwards King Frederick I., after whom the town was named, contains a collection of antiquities and paintings. In the grounds stands a granite mausoleum, the work of Karl Friedrich Schinkel, with beautiful white marble recumbent statues of Frederick William III. and his queen Louise by Christian Daniel Rauch, and also those of the emperor William I. and the empress Augusta by Erdmann Encke. It was in the Schloss that the emperor Frederick III. took over the reins of government in 1888, and here he resided for nearly the whole of his three months' reign. The town contains an equestrian statue of Frederick. Of public buildings, the famous technical academy and the Kaiser Wilhelm memorial church are referred to in the article Berlin. In Charlottenburg is the Physikalisch-technische Reichsanstalt, a state institution for the carrying out of scientific experiments and measurements, and for testing instruments of precision, materials, &c. It was established in 1886 with money provided by Ernst Werner Siemens. In addition to the famous royal porcelain manufactory, Charlottenburg has many flourishing industries, notably iron-works grouped along the banks of the Spree. Its main thoroughfares are laid out on a spacious plan, while there are many quiet streets containing pretty villas. See also Berlin, Prussia; Berlin, Schloß Charlottenburg; Berlin, Lustschloß Schöneberg.

**Charlottesville**, a city and the county-seat of Albemarle county, Virginia, U.S.A., picturesquely situated on the Rivanna river, 66 m. (by rail) N.W. of Richmond in the beautiful Piedmont region. Pop. (1890) 5591; (1900) 6449 (2613 being negroes); (1910) 6765. The city is served by the Chesapeake & Ohio, and the Southern railways, and is best known as the seat of the University of Virginia (q.v.), which was founded by Thomas Jefferson. Here are also the Rawlings Institute for girls, founded as the Albemarle Female Institute in 1857, and a University school. Monticello, Jefferson's home, is still standing about 2 m. south-east of the city on a fine hill, called Little Mountain until Jefferson Italianised the name. The south pavilion of the present house is the original brick building, one and a half storeys high, first occupied by Jefferson in 1770. He was buried near the house, which was sold by his daughter some years after his death. George Rogers Clark was born near Monticello. Charlottesville is a trade centre for the surrounding country; among its manufactures are woolen goods, overalls, agricultural implements and...

cigars and tobacco. The city owns its water-supply system and owns and operates its gas plant; an electric plant, privately owned, lights the streets and many houses. The site of the city was a part of the Castle Hill estate of Thomas Walker (1715–
1794), an intimate friend of George Washington. The act establishing the town of Charlottesville was passed by the Assembly of Virginia in November 1762, when the name Charlottesville (in honour of Queen Charlotte, wife of George III.) first appeared. In 1777–1780 about 4000 of Burgoyne's troops, surrendered under the "Convention" of Saratoga, were quartered here; in October 1780 part of them were sent to Lancaster, Pa., and later the rest were sent north. In June 1781 Tarleton raided Charlottesville and the vicinity, nearly captured Thomas Jefferson, and destroyed the public records and some arms and ammunition. In 1888 Charlottesville was chartered as a city administratively independent of the county.

CHARLOTTETOWN, a city of Canada, the capital of Prince Edward Island, situated in Queen's county, on Hillsborough river. Pop. (1901) 12,680. It has a good harbour, and the river is navigable by large vessels for several miles. The export trade of the island centres here, and the city has regular communication by steamer with the chief American and Canadian ports. Besides its own and the country trade, it contains numerous churches, the Prince of Wales College, supported by the province, the Roman Catholic college of St. Dunstan's and a normal school; among its manufactures are woolen goods, lumber, canned goods, and foundry products. The head office and workshops of the Prince Edward Island railway are situated here. The town was founded in 1750 by the French under the name of Port la Jole, but under British rule changed its name in honour of the queen of George III.

CHARM (through the Fr. from the Lat. carmen, a song), an incantation, verses sung with supposed magical results, hence anything possessing powers of bringing good luck or averting evil, particularly articles worn with that purpose, such as an amulet. It is thus used of small trinkets attached to bracelets or chains. The word is also used, figuratively, of fascinating qualities of feature, voice or character.

CHARNAY, (CLAUDE JOSEPH) DÉSIRÉ (1828–), French traveller and archaeologist, was born in Fleurie (Rhône), on the 2nd of May 1828. He studied at the Lycée Charlemagne, in 1840 became a teacher in Nîmes, and afterwards in Lyons, and in 1845 became acquainted with John Lloyd Stephens's books of travel in Yucatan. He travelled in Mexico, under a commission from the French ministry of education, in 1852–1853; in Madagascar in 1863; in South America, particularly Chile and Argentina, in 1875; and in Java and Australia in 1878. In 1880–1883 he again visited the ruined cities of Mexico. Pierre Lorillard of New York contributed to defray the expense of this expedition, and Charnay named a great ruined city near the Guatemalan boundary line Ville Lorillard in his honour. Charnay went to Yucatan in 1886. The more important of his publications are "Les Mexique, souvenirs et impressions de voyage" (1863), being his personal report on the expedition 1852–61, of which the official report is to be found in Viollet-le-Duc's "Cités et ruines américaines: Méila, Palenqu, Ismail, Chichen-Itza, Usmal" (1863), vol. 19 of "Recueil des voyages et des documents; Les Anciennes Villes du Nouveau Monde" (1885; English translation, The Ancient Cities of the New World, 1887, by Mmes. Gonino and Conant); a romance, "Une Princesse indienne avant la conquête" (1888); "À travers les forêts de l'Inde" (1900) and Mon- sieur Ramiez: Histoire de l'origine des Indiens qui habitent la Nouvelle Espagne selon leurs traditions (1903). He translated Cortez's letters into French, under the title "Lettres de Ferrand Cortes à Charles-quinquint sur la découverte et la conquête du Mexique" (1896). He elaborated a theory of Toltec migrations and considered the prehistoric Mexican to be of Asiatic origin, because of observed similarities to Japanese architecture, Chinese decoration, Malaysian language and Cambodian dress, &c.

CHARNEL HOUSE (Med. Lat. carnarium), a place for depositing the bones which might be thrown up in digging graves. Sometimes, as at Gloucester, Hythe and Ripon, it was a portion of the crypt; sometimes, as at Old St Paul's and Worcester (both now destroyed), it was a separate building in the churchyard; sometimes chantry chapels were attached to these buildings. Viollet-le-Duc has given two very curious examples of such ossuaires (as they are called), one from Fluriance (Gers), the other from Faouët (Finistère).

CHARNOK, JOB (d. 1603), English founder of Calcutta, went out to India in 1655 or 1656, apparently not in the East India Company's service, but soon joined it. He was stationed at Cosimbazar, and subsequently at Patna. In 1665 he became chief agent at Hugli. Being besieged there by the Mogul viceroy of Bengal, he put the company's goods and servants on board his light vessels and dropped down the river 27 m. to the village of Sutanati, a place well chosen for the purpose of defence, which occupied the site of what is now Calcutta. It was only, however, at the third attempt that Charnock finally settled down at this spot, and the selection of the future capital of India was entirely due to his stubborn resolution. He was a silent morose man, not popular among his contemporaries, but "always a faithfull Man to the Company." He is said to have married a Hindu widow.

CHARNOCK (or CHERNOCK), ROBERT (c.1663–1696), English conspirator, belonged to a Warwickshire family, and was educated at Magdalen College, Oxford, becoming a fellow of his tutor. In 1687 the dispute arose between James II. and the fellows of Magdalen; on the latter day the election of a president Charnock favoured the first royal nominee, Anthony Farmer, and also the succeeding one, Samuel Parker, bishop of Oxford. Almost alone among the fellows he was not driven out in November 1687, and he became dean and then vice-president of the college under the new régime, but was expelled in October 1688. Residing at the court of the Stuarts in France, or conspiring in England, Charnock and Sir George Barclay appear to have arranged the details of the unsuccessful attempt to kill William III. near Turnham Green in February 1666. Barclay escaped, but Charnock was arrested, was tried and found guilty, and was hanged on the 18th of March 1666.

CHARNOKITIC, a series of foliated igneous rocks of wide distribution and great importance in India, Ceylon, Madagascar and Africa. The name was given by Dr T. H. Holland from the fact that the tombstone of Job Charnock, the founder of Calcutta, is made of a block of this rock. The charnockite series includes rocks of many different types, some being acid and rich in quartz and feldspar, others basic and containing much pyroxene and olivine, while there are also intermediate varieties of rocks corresponding mineralogically to norites, quartz-norites and diorites. A special feature, recurring in many members of the group, is the presence of strongly pleochroic, reddish or green hypersthene. Many of the minerals of these rocks are "schillerized," as they contain minute platy or rod-shaped enclosures, disposed parallel to certain crystallographic planes or axes. The reflection of light from the surfaces of these enclosures gives the minerals often a peculiar appearance, e.g., the quartz is blue and opalescent, the felspar has a milky shimmer like moonshine, the hypersthene has a bronze metalloidal gleam. Very often different rock types occur in close association as one set forms bands alternating with another, or veins traversing it, and where one facies appears the others also usually are found. The term charnockite consequently is not the name of a rock, but of an assemblage of rock types, connected in their origin because arising by differentiation of the same parent magma. The banded structure which these rocks commonly present in the field is only in a small measure due to metamorphism, but to a large extent original, and has been produced by fluxion in a viscous crysallizing magma, together with differentiation or segregation of the mass into bands of different chemical and mineralogical composition. There have also been, of course, earth movements operating on the solid rock at a later time and injection of dikes both parallel to and across the primary foliation. In fact, the history of the structures of the charnockite series is the history of the most primitive gneisses in all parts of the world, for which we cannot pretend to have as yet any thoroughly satisfactory explanations to offer. A striking fact is the very wide distribution of rocks of this group.
in the southern hemisphere; but they also, or rocks very similar to them, occur in Norway, France, Germany, Scotland and North America, though in Geographie algébrique (1832), he has mainly described as pyroxene granulites, pyroxene gneisses, anorthosites, &c. They are usually regarded as being of Archean age (preCambrian), and in most cases this can be definitely proved, though not in all. It is astonishing to find that in spite of their great age their minerals are often in excellent preservation. In India they form the Nilgiri Hills, the Shevaroys and part of the Western Ghats, extending southward to Cape Comorin and reappearing in Ceylon. Although they are certainly for the most part igneous gneisses (or orthogneisses), rocks occur along with them, such as marbles, scapolite limestones, and conundrum rocks, which were probably of sedimentary origin. (J. S. F.)

CHARLON, a celebrated lawyer of Catania in Sicily. His date is uncertain. Some make him a pupil of Pythagoras (c. 580-504 B.C.); but all that can be said is that he was earlier than Anaxilas of Rhégium (404-476), since his laws were in use amongst the Rhégians until they were abolished by that tyrant. His laws, originally written in verse, were adopted by the other Chalcidic colonies in Sicily and Italy. According to Aristotle there was nothing special about these laws, except that Charondas introduced actions for perjury; but he speaks highly of the precision with which they were drawn up (Politics, ii. 12). The story that Charondas killed himself because he entered the public assembly wearing a sword, which was a violation of his own law, is also told of Diocles and Zaleucus (Diod. Sic. xii. 11-19). The fragments of laws attributed to him by Stobaeus and Diodorus are of late (Neo-Pythagorean) origin.

See Bentley, On Phalaris, which (according to B. Niese s.s. in Pauly, Realencyclopädie) contains what is even now the best account of Resiades and Gephyretus Siculiæ; J. F. D. Gerlich, Zaleokus, Charondas, and Pythagoras (1858); also art. GRECO-LAW.

CHARPENTIER, FRANÇOIS (1620-1702), French archaeologist and man of letters, was born in Paris on the 15th of February 1620. He was intended for the bar, but was employed by Colbert, who had determined on the foundation of a French East India Company, to draw up an explanatory account of the project for Louis XIV. Charpentier regarded as absurd the use of Latin in monumental inscriptions, and to him was entrusted the task of supplying the paintings of Lebrun in the Versailles Gallery with appropriate legends. His verses were so indifferent that they had to be replaced by others, the work of Racine and Boileau, both enemies of his. Charpentier in his Excellence de la langte française (1683) had anticipated Perrault in the famous academical dispute concerning the relative merit of the ancients and moderns. He is credited with a share in the production of the magnificent series of medals that commemorate the principal events of the age of Louis XIV. Charpentier, who was long in receipt of a pension of 1200 livres from Colbert, was erudite and ingenious, but he was always heavy and commonplace. His other works include a Vie de Soratte (1650), a translation of the Cypreoside of Xenophon (1698), and the Traité de la peinture parlante (1684).

CHARRIE, AGNÉS ISABELLE ÉMILIE DE (1740-1803), Swiss author, was Dutch by birth, her maiden name being van Tuyl von Seerskerken van Zuylen. She married in 1771 her brother's tutor, M. de Charrère, and settled with him at Colombier, near Lausanne. She made her name by the publication of her Lettres neuchatelloises (Amsterdam, 1784), offering a simple and attractive picture of French manners. This, with Caliste, ou lettres écrites de Lausanne (2 vols, Geneva, 1785-1788), was analysed and highly praised by Sainte-Beuve in his Portraits de femmes et in vol. iii of his Portraits littéraires. She wrote a number of other novels, and some political tracts; but is perhaps best remembered by her liaison with Benjamin Constant between 1787 and 1796.

Charon's letters to Constant were printed in the Revue suisse (April 1842), her Lettres-Memoires by E. H. Gauthier in the same review in 1857, and all the available material is utilized in a monograph on her and her work by P. Godet, Madame de Charrière et ses amis (2 vols., Geneva, 1906).

CHARRON, PIERRE (1541-1603), French philosopher, born in Paris, was one of the twenty-five children of a bookseller. After studying law he practise at Paris as an advocate, but, having met with no great success, entered the church, and soon gained the highest popularity as a preacher, rising to the dignity of canon, and being appointed preacher in ordinary to Marguerite, wife of Henry IV. of Navarre. About 1588, he determined to fulfil a vow which he had once made to enter a cloister; but being rejected by the Carthusians and the Celestines, he held himself absolved, and continued to follow his old profession. He delivered a course of sermons at Angers, and in the next year passed to Bordeaux, where he formed a famous friendship with Montaigne. At the death of Montaigne, in 1592, Charron was requested in his will to bear the Montaigne arms.

In 1594 Charron published (at first anonymously, afterwards under the name of "Benoit Vaillant, Advocate of the Holy Faith," and also, in 1594, in his own name) Les Trois Vérités, in which by methodical and orthodox arguments, he seeks to prove that there is a God and a true religion, that the true religion is the Christian, and that the true church is the Roman Catholic.
The last book (which is three-fourths of the whole work) is chiefly an answer to the famous Protestant work entitled *Le Triomphe de l'Église* by Du Plessis Mornay; and in the second edition (1605) there is an elaborate reply made to the third *Vérité* by a Protestant writer. *Les Trois Vérités* ran through several editions, and obtained for its author the favour of the bishop of Cahors, who appointed him grand vicar and theological canon. It also led to his being chosen deputy to the general assembly of the clergy, of which body he became chief secretary. It was followed in 1600 by *Discours chrétiens*, a book of sermons, similar in tone, half of which treat of the Eucharist. In 1601 Charron published at Bordeaux his third and most remarkable work—the famous *De la sagesse*, a complete popular system of moral philosophy. Usually, and so far correctly, it is coupled with the Essays of Montaigne, to which the author is under very extensive obligations. There is, however, distinct individuality in the book. It is specially interesting from the time when it appeared, and the man by whom it was written. Conspicuous as a champion of orthodoxy against atheists, Jews and Protestants—without resigning this position, and still upholding practical orthodoxy—Charron suddenly stood forth as the representative of the most complete intellectual scepticism. The *De la sagesse*, which represented a considerable advance on the standpoint of the *Trois Vérités*, brought upon its author the most violent attacks, the chief being by the Jesuit François Garasse (1585–1631), who described him as a "brutal atheist." It received, however, the warm support of Henry IV, and of the president Pierre Jeannin (1540–1622). A second edition was soon called for. In 1603, notwithstanding much opposition, it began to appear; but only a few pages had been printed when Charron died suddenly in the street of apoplexy. His death was regarded as a judgment for his impiety.

Charron's psychology is sensationalist. With sense all our knowledge commences, and into sense all may be resolved. The soul, located in the ventricles of the brain, is affected by the temperament of the individual; the dry temperament produces acute intelligence; the moist, memory; the hot, imagination. Dividing the intelligent soul into these three faculties, he shows—after the manner which Francis Bacon subsequently adopted—what branches of science correspond with each. With regard to the nature of the soul he merely quotes opinions. The belief in its immortality, he says, is the most universal of beliefs, but the most feebly supported by reason. As to man's power of attaining truth his scepticism is decided; and he plainly declares that none of our faculties enable us to distinguish truth from error. In comparing man with the lower animals, Charron insists that there are no breaks in nature. The latter have reason; nay, they have virtue; and, though inferior in some respects, in others they are superior. The estimate formed of man is not, indeed, flattering. His most essential qualities are vanity, weakness, inconstancy, presumption. Upon this view of human nature and the human lot Charron finds his moral system. Equally sceptical with Montaigne, and decidedly more cynical, he is distinguished by a deeper and sterner tone. Man comes into the world to enjoy; let him enjoy then, and the best exercise of his faculties. Our compassion should resemble that of God, who succours the suffering without sharing in their pain. Avoid vulgar errors; cherish universal sympathy. Let no passion or attachment become too powerful for restraint. Follow the customs and laws which surround you. Morality has no connexion with religion. Reason is the ultimate criterion.

Special interest attaches to Charron's treatment of religion. He insists on the diversities in religions; he dwells also on what would indicate a common origin. All grow from small beginnings and increase by a sort of popular contagion; all teach that God is to be appealed by prayers, presents, vows, but especially, and most irrationally, by human suffering. Each is said by its devotees to have been given by inspiration. In fact, however, a man is a Christian, Jew, or Mahomedan, before he knows he is a man. One religion is built upon another. But while he openly declares religion to be "strange to common sense," the practical result at which Charron arrives is that one is not to sit in judgment on his faith, but to be "simple and obedient," and to allow himself to be led by public authority. This is one rule of wisdom with regard to religion; and another equally important is to avoid superstition, which he boldly defines as the belief that God is like a hard judge who, eager to find fault, narrowly examines our slightest act, that He is revengeful and hard to appease, and that therefore He must be flattered and importuned, and won over by pain and sacrifice. True piety, which is the first of duties, is, on the other hand, the knowledge of God and of one's self, the latter knowledge being necessary to the former. It is the abasing of man, the exalting of God,—the belief that what He sends is all good, and that all the bad is from ourselves. It leads to spiritual worship; for external ceremony is merely for our advantage, not for His glory. Charron is thus the founder of modern secularism. His political views are neither original nor independent. He pours much hackneyed scorn on the common herd, declares the sovereign to be the source of law, and asserts that popular freedom is dangerous.

A summary and defence of the Sagesse, written shortly before his death, appeared in 1606. In 1604 his friend Michel de la Rochefoucauld prefixed to an edition of the Sagesse a Life, which depicts Charron as a most amiable man of purest character. His complete works, with this Life, were published in 1655. An excellent abridgment of the *Sagesse*, by Henry Duval, appeared in 1826, with an edition with notes by A. Duval appeared in 1826.

**CHARRUA**—**CHART**

*CHARRUA*, a tribe of South American Indians, wild and warlike, formerly ranging over Uruguay and part of S. Brazil. They were dark and heavily built, fought on horses and used the bolas or weighted lasso. They were always at war with the Spaniards, and Juan Díaz de Solís was killed by them in 1516. As a tribe they are now almost extinct, but the modern Gauchos of Uruguay have much Charrua blood in them.

*CHART* (from Lat. *carta*, *charta*, a map). A chart is a marine map intended specially for the use of seamen (for history, see *MAP*), though the word is also used loosely for other varieties of graphical representation. The marine or nautical chart is constructed for the purpose of ascertaining the position of a ship with reference to the land, of finding the direction in which she has to steer, the distance to sail or steam, and the hidden dangers to avoid. The surface of the sea on charts is studded with numerous small figures. These are known as the *soundings*, indicating in fathoms or in feet (as shown upon the title of the chart), at low water of ordinary spring tides, the least depth of water through which the ship may be sailing. Charts show the nature of the unseen bottom of the sea—with the irregularities in its character in the shape of hidden rocks or sand-banks, and give information of the greatest importance to the mariner. No matter how well the land may be surveyed or finely delineated, unless the soundings are shown a chart is of little use.

The British admiralty is the chief cartographer, and the chart and issued by the hydrographic office. This department of the admiralty was established under Earl Spencer by an order in council in 1795, consisting of the hydrographer, one assistant and a draughtsman. The first hydrographer was Alexander Dalrymple, a gentleman in the East India Company's civil service. From this small beginning arose the important department which is now the main source of the supply of hydrographical information to the whole of the maritime world. The charts prepared by the officers and draughtsmen of the hydrographic office, and published by order of the lords commissioners of the admiralty, are compiled chiefly from the labours of British naval officers employed in the surveying service; and also from valuable contributions received from time to time from officers of the royal navy and mercantile marine. In addition to the work of British sailors, the labours of other nations have been collected and utilized. Charts of the coasts of Europe have naturally been taken from the surveys made by the various nations, and in charts of other quarters of the world considerable assistance has
been received from the labours of French, Spanish, Dutch and American surveyors. Important work is done by the Hydrographic Office of the American navy, and the U.S. Coast and Geodetic Survey. The admeasurement of the wants of the sailor in all parts of the world. They may be classed under five heads, viz. ocean, general, and coast charts, harbour plans and physical charts; for instance, the Indian Ocean, the Mediterranean, approaches to Plymouth, Plymouth Sound and wind and current charts. The harbour plans and coast sheets are constructed on the simple principles of plane trigonometry by the surveying officers. (See Surveying: Nautical.) That important feature, the depth of the sea, is obtained by the ordinary sounding line or wire; all soundings are reduced to low water of ordinary spring tides. The times and heights of the tides, with the direction and velocity of the tidal streams, are also ascertained. These MS. charts are forwarded to the admiralty, and form the foundation of the hydrography of the world. The ocean and general charts are compiled and drawn at the hydrographic office, and as originals, existing charts, latest surveys and maps, have to be consulted, their compilation requires considerable experience and is a partaking work, for the compiler to come to, what to omit, what to insert, and the necessary names in such a manner that while full information is given, the features of the coast are not interfered with. As a very slight error in the position of a light or buoy, dot, cross or figure, might lead to grave disaster, every symbol on the admiralty chart has been delineated with great care and consideration, and no pains are spared in the effort to lay before the public the labours of the nautical surveyors and explorers not only of England, but of the maritime world; reducing their various styles into a comprehensive system furnishing the intelligent seaman with an intelligible guide, which common industry will soon enable him to appreciate and take full advantage of.

As certain abbreviations are used in the charts, attention is called to the "signs and abbreviations adopted in the charts published by the admiralty." Certain parts of the world are still unsurveyed, or not surveyed in sufficient detail for the requirements that steamships now demand. Charts of these localities are therefore drawn in a light hair-line and unfinished manner, so that the experienced seaman sees at a glance that less trust is to be reposed upon charts drawn in this manner. The charts given to the public are only correct up to the time of their actual publication. They have to be kept up to date. Recent publications by foreign governments, newly reported dangers, changes in character or position of lights and buoys, are as soon as practicable inserted on the charts and due notice given of such insertions in the admiralty "Notices to Mariners."

The charts are supplemented by the Admiralty Pilots, or books of sailing directions, with tide tables, and lists of lighthouses, light vessels, &c., for the coasts to which a pilot may be bound. (I.) The physical charts are the continuation of the work so ably begun by Maury of the United States and FitzRoy of the British navy, and give the sailor a good general idea of the world's ocean winds and currents at the different periods of the year; the probable tracks and seasons of the tropical revolving or cyclonic storms; the coastal winds; the extent or months of the rainy seasons; localities and times when ice may be fallen in with; and, lastly, the direction and force of the current and drift of the ocean.

CHARTER (Lat. charta, carta, from Gr. χάρτης, originally for χαρπής, material for writing, thence transferred to paper and from this material to the document, in O. Eng. boke, book), a written instrument, contract or convention by which cessions of sales of property or of rights and privileges are confirmed and held, and which may be produced by the grantees in proof of lawful possession. The use of the word for any written document is obsolete in England, but is preserved in France, e.g. the École des Chartes at Paris. In feudal times charters of privileges were granted, not only by the crown, but by mesne lords both lay and ecclesiastical, as well to communities, such as boroughs, gilds and religious foundations, as to individuals. In modern usage grants by charter have become all but obsolete, though in England this form is still used in the incorporation by the crown of such societies as the British Academy.

The grant of the Great Charter by King John in 1215 (see Magna Carta), which guaranteed the preservation of English liberties led to a special association of the word with constitutional privileges, and so in modern times it has been applied to charters granted by sovereigns to their subjects in contradiction to those based on "the will of the people." Such was the Charter (Charte) granted by Louis XVIII. to France in 1814. In Portugal the constitution granted by Dom Pedro in 1826 was called by the French party the "Charter," while that devised by the Cortes in 1821 was known as the "Constitution." Magna Carta also suggested to the English radicals in 1838 the name "People's Charter," which they gave to their published programme of reforms (see Chartism). This association of the idea of liberty with the word charter led to its figurative use in the sense of freedom or licence. This is, however, rare; the most common use being in the phrase "chartered libertine" (Shakespeare, Henry V. Act I. Sc. 1) from the derivative verb "to charter," e.g. to grant a charter. The common colloquialism "to charter," in the sense of to take or hire, is derived from the special use of "to charter" as to hire (a ship) by charter-party.

CHARTERED COMPANIES. A chartered company is a trading corporation enjoying certain rights and privileges, and bound by certain obligations under a special charter granted to it by the sovereign authority of the state, such charter defining and limiting those rights, privileges and obligations, and the localities in which they are to be exercised. Such companies existed in early times, but have undergone changes and modifications in accordance with the developments which have taken place in the economic history of the states where they have existed. In Great Britain the first trading charters were granted, not to English companies, which were then non-existent, but to branches of the Hanseatic League (q.v.), and it was not till 1597 that England was finally relieved from the presence of a foreign chartered company. In that year Queen Elizabeth closed the steel-yard where Teutons had been established for 700 years.

The origin of all English trading companies is to be sought in the Merchants of the Staple. They lingered on into the 18th century, but only as a name, for their business was solely to export English products which, as English manufactures grew, were wanted at home. Of all early English chartered companies, the "Merchant Adventurers" conducted its operations the most widely. Itself a development of very early trading guilds, at the height of its prosperity it employed as many as 50,000 persons in the Netherlands, and the enormous influence it was able to exercise undoubtedly saved Antwerp from the institution of the Inquisition within its walls in the time of Charles V. In the reign of Elizabeth British trade with the Netherlands reached in one year 12,000,000 ducats, and in that of James I. the company's yearly commerce with Germany and the Netherlands was as much as £1,000,000. Hamburg afterwards was its principal depot, and it became known as the "Hamburg Company." In the "Merchant Adventurers'" enterprises is to be seen the germ of the trading companies which had so remarkable a development in the 16th and 17th centuries. These old regulated trade gilds passed their extension into joint-stock enterprises, which in turn passed into larger extension, both as to the number of members and amount of stock, each member being only accountable for the amount of his own stock, and being able to transfer it at will to any other person.

It was in the age of Elizabeth and the early Stuarts that the chartered company, in the modern sense of the term, had its rise. The discovery of the New World, and the opening out of fresh trading routes to the Indies, gave an extraordinary impulse to shipping, commerce and industrial enterprise throughout western Europe. The English, French and Dutch governments were ready to assist trade by the granting of charters to trading associations. It is to the "Russia Company," which received its first charter in 1554, that Great Britain owes its first intercourse with an empire then almost unknown. The first recorded instance of a largely chartered company annexing territory is to be found in the action of this company in setting
up a cross at Spitzbergen in 1613 with King James’s arms upon it. Among other associations trading to the continent of Europe, receiving charters at this time, were the Turkey Company (Levant Co.) and the Eastland Company. Both the Russia and Turkey Companies had an important effect upon British relations with those empires. They maintained British influence in those countries, and even paid the expenses of the embassies which were sent out by the English government to their courts. The Russia Company carried on a large trade with Persia through Russian territory; but from various causes their business gradually declined, though the Turkey Company existed in name until 1825.

The chartered companies which were formed during this period for trade with the Indies and the New World have had a more wide-reaching influence in history. The extraordinary career of the East India Company (q.v.) is dealt with elsewhere. Charters were given to companies trading to Guinea, Morocco, Guiana and the Canaries, but none of these enjoyed a very long or prosperous existence, principally owing to the difficulties caused by foreign competition. It is when we turn to North America that the importance of the chartered company, as a colonizing rather than a trading agency, is seen in its full development. The “Hudson’s Bay Company,” which still exists as a commercial concern, is dealt with under its own heading, but most of the thirteen British North American colonies were in their inception chartered companies very much in the modern acceptance of the term. The history of these companies will be found under the heading of the different colonies of which they were the origin. It is necessary, however, to bear in mind that two classes of charters are to be found in force among the early American colonies: (1) Those granted to trading associations, which were often useful when the colony was first founded, but which formed a serious obstacle to its progress when the country had become settled and was looking forward to commercial and political existence; sometimes they even led to serious conflicts between the grantees of the charter and the colonies; ultimately elective assemblies everywhere superseded control of trading companies. (2) The second class of charters were those granted to the settlers themselves, to protect them against the oppressions of the crown and the provincial governors. These were highly prized by the colonists.

In France and Holland, no less than in England, the institution of chartered companies became a settled principle of the governments of those countries during the whole of the period in question. In France from 1399 to 1789, more than 70 of such companies came into existence, but after 1770, when the great Compagnie des Indes orientales went into liquidation, they were almost abandoned, and finally perished in the general sweeping away of privileges which followed on the outbreak of the Revolution.

If we introduce into the economic ideas which induced the granting of charters to these earlier companies and animated their promoters, we shall find that they were entirely consistent with the general principles of government at the time and what were then held to be sound commercial views. Under the old régime everything was a matter of monopoly and privilege, and to this state of things the constitution of the old companies corresponded, the sovereign rights accorded to them being also quite in accordance with the views of the time. It would have been thought impossible then that private individuals could have found the funds or maintained the magnitude of such enterprises. It was only this necessity which induced statesmen like Colbert to countenance them, and Montesquieu took the same view (Esprit des lois, t. xx. c. 10). John de Witt’s view was that such companies were not useful for colonization properly so called, because they want quick returns to pay their dividends. So, even in France and Holland, opinion was by no means settled as to their utility. In England historic protests were made against such monopolies, but the chartered companies were less exclusive in England than in either France or Holland, the governors of provinces almost always allowing strangers to trade on receiving some pecuniary inducement. French commercial companies were more privileged, exclusive and artificial than those in Holland and England. Those of Holland may be said to have been national enterprises. French companies rested more than did their rivals on false principles; they were more fettered by the royal power, and had less initiative of their own, and therefore had less chance of surviving. As an example of the kind of rules which prevented the growth of the French companies, it may be pointed out that no Protestants were allowed to take part in them. State subventions, rather than commerce or colonization, were often their object; but that has been a characteristic of French colonial enterprise at all times.

Such companies, however, under the old commercial system could hardly have come into existence without exclusive privileges. Their existence might have been prolonged had the whole people in time been allowed the chance of participating in them.

To sum up the causes of failure of the old chartered companies, they are to be attributed to (1) bad administration; (2) want of capital and credit; (3) bad economic organization; (4) distribution of dividends made premature and fictitiously. But those survived the longest which extended the most widely their privileges to outsiders. According to contemporary protests, they had a most injurious effect on the commerce of the countries where they had their rise. They were monopolies, and therefore, of course, obnoxious; and it is undoubtedly that the colonies they founded only became prosperous when they had escaped from their yoke.

On the other hand, it must not be forgotten that they contributed in no small degree to the commercial progress of their own states. They gave colonies to the mother country, and an impulse to the development of its fleet. In the case of England and Holland, the enterprise of the companies saved them from suffering from the monopolies of Spain and Portugal, and the wars of the English and the Dutch in the Indies with Spain and Portugal were largely due to the companies. They furnished the mother country with luxuries which, by the 18th century, had become necessities. They offered a career for the younger sons of good families, and sometimes greatly assisted large and useful enterprises.

During the last twenty years of the 17th century there was a great revival of the system of chartered companies in Great Britain. It is a feature of the general growth of interest in colonial expansion and commercial development which has made itself felt almost universally among European nations. Great Britain, however, alone has succeeded in establishing such companies as have materially contributed to the growth of her empire. These companies succeed or fail for reasons different from those which affected the chartered companies of former days, though there are points in common. Apart from causes inherent in the particular case of each company, which necessitates their being examined separately, recent experience leads us to lay down certain general principles regarding them. The modern companies are not monopolists; they have only a limited sovereignty, always being subject to the control of the home government. It is true that they have certain advantages given them, for without these advantages no capital would risk itself in the lands where they carry on their operations. They often have very heavy corresponding obligations, as will be seen in the case of one (the East Africa) where the obligations were too onerous for the company to discharge, though they were inseparable from its position. The charters of modern companies differ in two points strongly from those of the old: they contain clauses prohibiting any monopoly of trade, and they generally confer some special political rights directly under the control of the secretary of state. The political freedom of the old companies was much greater. In these charters state control has been made a distinguishing feature. It is to be exercised in almost all directions in which the companies may come into contact with matters political. Of course, it is inevitable in all disputes of the companies with foreign powers,
and is extended over all decrees of the company regarding the administration of its territories, the taxation of natives, and mining regulations. In all cases of dispute between the company and the natives the secretary of state is ex officio the judge, and to the secretary of state (in the case of the South Africa Company) the accounts of administration have to be submitted for his approbation. It is deserving of notice that the British character of the company is insisted upon in each case in the charter which calls it into life. The crown always retains complete control over the company by reserving to itself the power of revoking the charter in case of the neglect of its stipulations. Special clauses were inserted in the charters of the British East Africa and South Africa Companies enabling the government to forfeit their charters if they did not promote the objects alleged as reasons for demanding a charter. This bound them still more strongly; and in the case of the South Africa Company the duration of the charter was fixed at twenty-five years.

The chartered company of these days is therefore very strongly fixed within limits imposed by law on its political action. As a whole, however, very remarkable results have been achieved. They may be attributed to the small degree to which the men who have had the supreme direction at home and abroad, and who have, by their social position and personal qualities, acquired the confidence of the public. With the exception of the Royal Niger Company, it would be incorrect to say that they have been financially successful, but in the domain of government generally it may be said that they have added vast territories to the British empire (in Africa about 1,700,000 sq. m.), and in these territories they have acted as a civilizing force. They have made roads, opened facilities for trade, enforced peace, and laid at all events the foundation of settled administration. It is not too much to say that they have often acted unselfishly for the benefit of the mother country and even humanity. We may instance the anti-slavery and anti-alcohol campaigns which have been carried on, the latter certainly being against the immediate pecuniary interests of the companies themselves. It must, of course, be recognized that to a certain extent this has been done under the influence of the home government. The occupation of Uganda certainly, and of the Nigerian territory and parts probably, will prove to have been rather for the benefit of posterity than of the companies which effected it. In the two cases where the companies have been bought out by the state, they have had no compensation for much that they have expended. In fact, it would have been impossible to take into account actual expenditure day by day, and the cost of wars. To use the expression of Sir William Mackinnon, the shareholders have been compelled in some cases to "take out their dividends in philanthropy."

The existence of such companies to-day is justified in certain political and economic conditions only. It may be highly desirable for the government to occupy certain territories, but political exigencies at home will not permit it to incur the expenditure, or international relations may make such an undertaking inexpedient at the time. In such a case the formation of a chartered company may be the best way out of the difficulty. But it has been demonstrated again and again that, directly the company’s interests begin to clash with those of the home government, that the home government must assume a protectorate over its territories in order to simplify the situation and save perhaps disastrous collisions. So long as the political relations of such a company are with savages or semi-savages, it may be left free to act, but directly it becomes involved with a civilized power the state has (if it wishes to retain the territory) to acquire by purchase the political rights of the company, and it is obviously much easier to induce a popular assembly to grant money for the purpose of maintaining rights already existing than to acquire new ones. With the strict system of government supervision enforced by modern charters it is not easy for the state to be involved against its will in foreign complications. Economically such companies are also justifiable up to a certain point. When there is no other means of entering into commercial relations with remote and savage races save by enterprise of such magnitude that private individuals could not incur the risk involved, then a company may be well entrusted with special privileges for the purpose, as an inventor is accorded a certain protection by law by means of a patent which enables him to bring out his invention at a profit if there is anything in it. But such privileges should not be continued longer than is necessary for the purpose of reasonably reimbursing the adventurers. A successful company, even when it has lost monopoly or privileges, has, by its command of capital and general resources, established so strong a position that private individuals or new companies can rarely compete with it successfully. That this is so is clearly shown in the case of the Hudson’s Bay Company as at present constituted. In colonizing new lands these companies often act successfully. They have proved more potent than the direct action of governments. This may be seen in Africa, where France and England have of late acquired vast areas, but have developed them with very different results, acting from the opposite principles of private and state promotion of colonization. Apart from national characteristics, the individual has far more to gain under the British system of private enterprise. A strong point in favour of them was that the companies have been recognized as companies, and their undertakings have been practically extensions of existing British colonies rather than entirely isolated ventures. But a chartered company can never be anything but a transition stage of colonization; sooner or later the state must take the lead. A company may act beneficially so long as a country is undeveloped, but as soon as it becomes even semi-civilized its conflicts with private interests become so frequent and serious that its authority has to make way for that of the central government.

The companies which have been formed in France during recent years do not yet afford material for profitable study, for they have been subject to so much vexatious interference from home owing to lack of a fixed system of control sanctioned by government, that they have not been able, like the British, to develop along their own lines.

CHARTERHOUSE. This name is an English corruption of the French maison chartreuse, a religious house of the Carthusian order. As such it occurs not uncommonly in England, in various places (e. g. Charterhouse-on-Mendip, Charterhouse-Hinton) and this is perhaps one of the reasons why it is familiar, however, in its application to the Charterhouse, London. On a site near the old city wall, west of the modern thoroughfare of Aldersgate, a Carthusian monastery was founded in 1371 by Sir Walter de Manny, a knight of French birth. After its dissolution in 1535 the property passed through various hands. In 1558, while in the possession of Lord North, it was occupied by Queen Elizabeth during the preparations for her coronation, and James I. held court here on his first entrance into London. The Charterhouse was then in the hands of Thomas Howard, earl of Suffolk, but in May 1611 it came into those of Thomas Sutton (1532–1611) of Snaith, Lincolnshire. He acquired a fortune by the discovery of coal on two estates which he had leased near Newcastle-on-Tyne, and afterwards, removing to London, he carried on a commercial career. In the year of his death, which took place on the 12th of December 1611, he
enowned a hospital on the site of the Charterhouse, calling it the hospital of King James; and in his will he bequeathed moneys to maintain a chapel, hospital (alms-house) and school. The will was hotly contested but upheld in court, and the foundation was finally constituted to afford a home for eighty male pensioners ("gentlemen by descent and in poverty, soldiers that have borne arms by sea or land, merchants decayed by piracy or shipwreck, or servants in household to the King or Queen's Majesty"), and to educate forty boys. The school developed beyond the original intentions of its founder, and now ranks among the most eminent public schools in England. In 1872 it was removed, during the headmastership (1863–1867) of the Rev. William Haig-Brown (d.1907), to new buildings near Godalming in Surrey, which were opened on the 18th of June in that year. The number of foundation scholarships is increased to sixty. The scholars are not now distinguished by wearing a special dress or by forming a separate house, though one house is known as Gowynboys, preserving the former title of the scholars. The lands on which the old school buildings stood in London was sold for new buildings to accommodate the Merchant Taylors' school, but the pensioners still occupy their picturesque home, themselves picturesque figures in the black gowns designed for them under the foundation. The buildings, of mellowed red brick, include a panelled chapel, in which is the founder's tomb, a fine dining-hall, governors' room with ornate ceiling and tapestried walls, the old library, and the beautiful great staircase.

CHARTER-PARTY (Lat. charta paritula, a legal paper or instrument, "divided," i.e. written in duplicate so that each party retains half), a written, or partly written and partly printed, contract between merchant and shipowner, by which a ship is let or hired for the conveyance of goods on a specified voyage, or for a definite period. (See AFFREIGHTMENT.)

CHARTERS TOWERS, a mining town of Devonport county, Queensland, Australia, 28 m. by rail S.W. of Townsville and 83 m. direct N.N.W. of Brisbane. It is the centre of an important gold-field, the reefs of which improve at the lower depths, the deepest shaft on the field being 2558 ft. below the surface-level. The gold is of a very fine quality. An abundant water-supply is obtained from the Burdekin river, some 8 m. distant. The population of the town in 1901 was 5523; but within a 5 m. radius it was 20,976. Charters Towers became a municipality in 1877.

CHARTIER, ALAIN (c.1392–1430), French poet and political writer, was born at Bayeux about 1392. Chartier belonged to a family marked by considerable ability. His eldest brother Guillaume became bishop of Paris; and Thomas became notary to the king. Jean Chartier, a monk of St Denis, whose history of Charles VII. is printed in vol. iii. of Les Grands Chroniques de Saint-Denis (1477), was not, as is sometimes stated, also a brother of the poet. Alain studied, as his elder brother had done, at the university of Paris. His earliest poem is the Livre des quatre dames, written after the battle of Agincourt. This was followed by the Débat du rèveille-matin. La Belle Dame sans merci, and others. None of these poems show any very patriotic feeling, though Chartier's prose is evidence that he was not indifferent to the misfortunes of his country. He followed the fortunes of the dauphin, afterwards Charles VII. and, acting in the triple capacity of clerk, notary and financial secretary. In 1422 he wrote the famous Quadrilogue-inexact. The interlocutors in this dialogue are France herself and the three orders of the state. Chartier lays bare the abuses of the feudal army and the sufferings of the peasants. He rendered an immense service to his country by maintaining that the cause of France, though desperate to all appearance, was not yet lost if the contending factions could lay aside their differences in the face of the common enemy. In 1424 Chartier was sent to the embassy to Germany, and three years later he accompanied to Scotland the mission sent to negotiate the marriage of Margaret of Scotland, then not four years old, with the dauphin, afterwards Louis XI. In 1429 he wrote the Livre d'espérance, which contains a fierce attack on the nobility and clergy. He was the author of a diatribe on the courtiers of Charles VII. entitled Le Curial translated into English (Here followeth the copy of a lettre whyche maistre A. Charetier wrote to his brother) by Caxton about 1484. The date of his death is to be placed about 1430. A Latin epitaph, discovered in the 18th century, says, however, that he was archdeacon of Paris, and declares that he died in the city of Avignon in 1440. This is obviously not authentic, for Alain described himself as a simple cleric and certainly died long before 1440. The story of the famous kiss bestowed by Margaret of Scotland on la preçieuse bouche de laquelle sont issues et sortis tant de bons mots et vertueuses paroles is mythical, for Margaret did not come to France till 1436, after the poet's death; but the story, first told by Guillaume Bouchet in his Annales d'Aquitaine (1524), is interesting, if only as a proof of the high degree of estimation in which the ugliest man of his day was held. Jean de Masles, who annotated a portion of his verse, has recorded how the pages and young gentlemen of that epoch were required daily to learn by heart passages of his Béréliade desnobles. The last verse stipulated him affectionately. His Belle Dame sans merci was translated into English by Sir Richard Ros about 1640, with an introduction of his own; and Clément Marot and Octavien de Saint-Gelais, writing fifty years after his death, find many fair words for the old poet, their master and predecessor.

See Mancel, Alain Chartier, étude bibliographique et littéraire, 8vo (Paris, 1849); D. Delaunay's Étude sur Alain Chartier (1876), with considerable extracts from his writings. His works were edited by A. Bouchet (Paris, 1822), and V. Duchesne, "Essais critiques sur les historiens originaux du règne de Charles VIII," in the Bibl. de l'École des Chartes (July-August 1857).

CHARTISM, the name given to a movement for political reform in England, from the so-called "People's Charter" or "National Charter," the document in which in 1838 the scheme of reforms was embodied. The movement itself may be traced to the latter years of the 18th century. Checked for a while by the reaction due to the excesses of the French Revolution, it received a fresh impetus from the awful misery that followed the Napoleonic wars and the exorbitant changes due to the introduction of machinery. The Six Acts of 1819 were directed, not only against agrarian and industrial rioting, but against the political movement of which Sir Francis Burdett was the spokesman in the House of Commons, which demanded manhood suffrage, the ballot, annual parliaments, the abolition of the property qualification for members of parliament and their payment. The movement was checked for a while by the Reform Bill of 1832; but it was soon discovered that, though the middle classes had been enfranchised, the economic and political grievances of the labouring population remained unredressed. Two separate movements now developed: one socialistic, associated with the name of Robert Owen; the other radical, aiming at the enfranchisement of the "masses" as the first step to the amelioration of their condition. The latter was repudiated in the Working Men's Association, by which in 1838 the "People's Charter" was drawn up. It embodied exactly the same programme as that of the radical reformers mentioned above, with the addition of a demand for equal electoral districts.

In support of this programme a vigorous agitation began, the principal leader of which was Feargus O'Connor, whose irresponsible and erratic oratory produced a vast effect. Monster meetings were held, at which seditious language was occasionally used, and slight collisions with the military took place. Petitions of enormous size, signed in great part with fictitious names, were presented to parliament; and a great many newspapers were started, of which the Northern Star, conducted by Feargus O'Connor, had a circulation of 50,000. In November 1839 a Chartist mob consisting of miners and others made an attack on Newport, Mon. The rising was a total failure; the leaders, John Frost and two others, were seized, found guilty of high treason, and were condemned to death. The sentence, however, was suspended and the men were sentenced to transportation, and John Frost spent over fourteen years in Van Diemen's Land. In 1854 he was pardoned, and from 1856 until his death on the 29th of July 1877 he lived in England. In 1840 the Chartist movement was still further organized by the inauguration at Manchester of the National
Charter Association, which rapidly became powerful, being the head of about 400 sister societies, which are said to have numbered 40,000 members. Some time after, efforts were made towards a coalition with the more moderate radicals, but these failed; and a land scheme was started by O’Connor, which prospered for a few years. In 1844 the uncompromising spirit of some of the leaders was well illustrated by their hostile attitude towards the Anti-Corn-Law League. O’Connor, especially, entered into a public controversy with Cobden and Bright, in which he was worsted. But it was not till 1848, during a season of great suffering among the working classes, and under the influence of the revolution at Paris, that the real strength of the Chartist movement was discovered and the prevalent discontent became known. Early in March disturbances occurred in Glasgow which required the intervention of the military, while in the manufacturing districts all over the west of Scotland the operatives were ready to rise in the event of the main movement succeeding. Some agitation, too, took place in Edinburgh and in Manchester, but, of a milder nature; in fact, while there was a real and widespread discontent, men were indisposed to resort to decided measures.

The principal scene of intended Chartist demonstration was London. An enormous gathering of half a million was announced for the 10th of April on Kennington Common, from which they were to march to the Houses of Parliament to present a petition signed by nearly six million names, in order by this imposing display of numbers to secure the enactment of the six points. Probably some of the more violent members of the party thought to imitate the Parisian mob by taking power entirely into their own hands. The announcement of the procession excited great alarm, and the most decided measures were taken by the authorities to prevent a rising. The procession was forbidden. The military were called out under the command of the duke of Wellington, and by him concealed near the bridges and other points where the procession might attempt to force its way. Even the Bank of England and other public buildings were put in a state of defence, and special constables, to the number, it is said, of 170,000, were enrolled, one of whom was destined shortly after to be the emperor of the French.

After all these gigantic preparations on both sides the Chartist demonstration proved to be a very insignificant affair. Instead of half a million, only about 50,000 assembled on Kennington Common, and their leaders, Feargus O’Connor and Ernest Charles Jones, shrank from the responsibility of braving the authorities by conducting the procession to the Houses of Parliament. The monster petition was duly presented, and scrutinized, with the result that the number of signatures was found to have been grossly exaggerated, and that the most unheard-of falsification of names had been resorted to. Thereafter the movement specially called Chartist soon died out. It became merged, so far as its political programme is concerned, with the advancing radicalism of the general democratic movement.

CHARTRES, a city of north-western France, capital of the department of Eure-et-Loir, 55 m. S.W. of Paris on the railway to Le Mans. Pop. (1906) 19,433. Chartres is built on the left bank of the Eure, on a hill crowned by its famous cathedral, the spires of which are a landmark in the surrounding country. "To the south-east stretches the fruitful plain of Beauce, the granary of France," of which the town is the commercial centre. The Eure, which at this point divides into three branches, is crossed by several bridges, some of them ancient, and is fringed in places by remains of the old fortifications, of which the Porte Guillaume (14th century), a gateway flanked by towers, is the most complete specimen. The steep, narrow streets of the old town contrast with the wide, shady boulevards which encircle it and divide it from the suburbs. The Clos St Jean, a pleasant park, lies to the north-west, and squares and open spaces are numerous. The cathedral of Notre-Dame (see Architecture: Romanesque and Gothic Architecture in France; and Cathedral), one of the finest Gothic churches in France, was founded in the 12th century by Bishop Fulbert on the site of an earlier church destroyed by fire. In 1194 another conflagration laid waste the new building then hardly completed; but clergy and people set zealously to work, and the main part of the present structure was finished by 1240. Though there have been numerous minor additions and alterations since that time, the general character of the cathedral is unimpaired. The upper woodwork was consumed by fire in 1836, but the rest of the building was saved. The statuary of the lateral portals, the stained glass of the 13th century, and the choir-screen of the Renaissance are all unique from the artistic standpoint. The cathedral is also renowned for the beauty and perfect proportions of its western towers. That to the south, the Clocher Vieux (351 ft. high), dates from the 13th century; its upper portion is lower and less rich in design than that of the Clocher Neuf (377 ft.), which was not completed till the 16th century. In length the cathedral measures 440 ft., its choir measures 150 ft. across, and the height of the vaulting is 171 ft. The abbey church of St Pierre, dating chiefly from the 13th century, contains, besides some fine stained glass, twelve representations of the apostles in enamel, executed about 1547 by Léonard Limosin. Of the other churches of Chartres the chief are St Aignan (13th, 16th and 17th centuries) and St Martin-au-Val (15th century). The hôtel de ville, a building of the 17th century, contains in the hall, the hôtel de ville of the 13th century, and several medieval and Renaissance houses, are of interest. There is a statue of General F. S. Marceau-Desgraviers (b. 1769), a native of the town.

The town is the seat of a bishop, a prefecture, a court of assizes, and has tribunals of first instance and of commerce, a chamber of commerce, training colleges, a lycée for boys, a communal college for girls, and a branch of the Bank of France. Its trade is carried on chiefly on market-days, when the peasants of the Beauce bring their crops and live-stock to be sold and make their purchases. The game-pies and other delicacies of Chartres are well known, and the industries also include flour-milling, brewing, distilling, iron-founding, leather manufacture, dyeing, and the manufacture of stained glass, billiard requisites, hosiery, &c.

Chartres was one of the principal towns of the Carnutes, and by the Romans called Auverium, from the river Astura (Eure), and afterwards civitas Carnutum. It was burnt by the Normans in 858, and unsuccessfully besieged by them in 911. In 1194 it was taken by the English, and in 1432 recovered by the Protestants in 1568, and was taken in 1591 by Henry IV., who was crowned there three years afterwards. In the Franco-German War it was seized by the Germans on the 21st of October 1870, and continued during the rest of the campaign an important centre of operations. During the middle ages it was the chief town of the district of Beauce, and gave its name to a countship which was held by the counts of Blois and Champagne and afterwards by the house of Châtillon, a member of which in 1286 sold it to the crown. It was raised to the rank of a duchy in 1528 by Francis I. After the time of Louis XIV. the title of duke of Chartres was hereditary in the family of Orleans.

See M. T. Bulteau, Monographie de la cathédrale de Chartres (1887); A. Pierart, Chartre, sa cathédrale, ses monuments (1890); H. J. L. J. Meurant, Chartres: Its Cathedral and Churches (1900).

CHARTREUSE, a liqueur, so called from having been made at the famous Carthusian monastery, La Grande Chartreuse, at Grenoble (see below), in consequence of the Associations Law, the Chartreux monks left France in 1804, and now continue the manufacture of this liqueur in Spain. There are two main varieties of Chartreuse, the green and the yellow. The green contains about 57, the yellow about 43 % of alcohol. There are other differences due to the varying nature and quantity of the flavouring matters employed, but the secrets of manufacture are jealously guarded. The genuine liqueur is undoubtedly produced by means of a distillation process.

CHARTREUSE, LA GRANDE, the mother house of the very severe order of Carthusian monks (see CARThUSIANS). It is situated in the French department of the Isère, about 12¾ m. N. of Grenoble, at a height of 3205 ft. above the sea, in the heart of a group of limestone mountains, and not far from the source.
CHARWOMAN—CHASE, S. P. 955

of the Guiers Mort. The original settlement here was founded by St Bruno about 1084, and derived its name from the small village to the S.E., formerly known as Cartisus, and now as St Pierre de Chartreuse. The first convent on the present site was built between 1132 and 1137, but the actual buildings date only from about 1676, the older ones having been often burnt. The convent stands in a very picturesque position in a large meadow, sloping to the S.W., and watered by a tiny tributary of the Guiers Mort. On the north, fine forests extend to the Col de la Ruchère, and on the west rise well-wooded heights, while on the east tower white limestone ridges, culminating in the Grand Som (6670 ft.). One of the most famous of the early Carthusian monks was St Hugh of Lincoln, who lived here from 1160 to 1181, when he went to England to found the first Carthusian house at Witham in Somerset; in 1186 he became bishop of Lincoln, and before his death in 1200 had built the angel choir and other portions of the wonderful cathedral there. The principal approach to the present site is from St Laurent du Pont, a village situated on the Guiers Mort, and largely built by the monks—it is connected by steam tramways with Voiron (for Grenoble) and St Béréon (for Chambéry). Among the other routes may be mentioned those from Grenoble by Le Sappey, or by the Col de la Charmette, or from Chambéry by the Col de Coux and the village of Les Échelles. St Laurent is about 5¼ m. from the convent. The road mounts along the Guiers Mort and soon reaches the hamlet of Fourvoirie, so called from forata vis, as about 1510 the road was first pierced hence towards the convent. Here are iron forges, and here was formerly the chief manufactory of the famed Chartreuse liqueur. Beyond, the road enters the “Desert” and passes through most delightful scenery. Some way farther the Guiers Mort is crossed by the modern bridge of St Bruno, the older bridge of Parant being still visible higher up the stream. Here begins the splendid carriage road, constructed by M. E. Vialot between 1854 and 1868, which passes beneath the bold plinths of the Oeillette or Aiguillette, beyond which former women were not allowed to penetrate. After passing through four tunnels the road bends north (leaving the Guiers Mort which flows past St Pierre de Chartreuse), and the valley soon opens to form the upland hollow in which are the buildings of the convent. These are not very striking, the high roofs of dark slate, the cross-surfaced turrets and the lofty clock-tower being the chief features. But the situation is one of ideal peace and repose. Women were formerly lodged in the old infirmary, close to the main gate, which is now a hotel. Within the convent buildings are four halls formerly used for the reception of the priors of the various branch houses in France, Italy, Burgundy and Germany. The very plain and undecorated chapel dates from the 15th century, but the cloisters, around which cluster the thirty-six small houses for the fully professed monks, are of later date. The library contains before the Revolution a very fine collection of books and MSS., now mostly in the town library at Grenoble.

The monks were expelled in 1793, but allowed to return in 1816, but then they had to pay rent for the use of the buildings and the forests around, though both one and the other were due to the industry of their predecessors. They were again expelled in 1894, and are dispersed in various houses in England, at Pinerolo (Italy) and at Tarragona (Spain). It is at the last named spot that the various pharmaceutical preparations are now manufactured for which they are famous (though sold only since about 1840)—the Elixir, the Boule d’acier (a mineral paste or salve), and the celebrated liqueur. The magnificent revenues derived from the profits of this manufacture were devoted by the monks to various purposes of benevolence, especially in the neighbouring villages, which owe to this source their churches, schools, hospitals, &c., &c., built and maintained at the expense of the monks.

The La Grande Chartreuse by un Chartreux (Grenoble, 1898); H. Ferrand, Guide à la Grande Chartreuse (1889); and Les Montagnes de la Chartreuse (1899) (W. A. B. C.)

CHARWOMAN, one who is hired to do occasional household work. "Char" or "chare," which forms the first part of the word, is common in many forms, to Teutonic languages, meaning a "turn," and, in this original sense, is seen in "aar," properly "on char," of a door "on the turn" in the act of closing. It is thus applied to a "turn of work," an odd job, and is so used, in the form "chore," in America, and in dialects of the south-west of England.

CHASE, SALMON PORTLAND (1808-1873). American statesman and jurist, was born in Cornish township, New Hampshire, on the 15th of January 1808. His father died in 1817, and the son passed several years (1820-1824) in Ohio with his uncle, Bishop Philander Chase (1775-1852), the foremost pioneer of the Protestant Episcopal Church in the West, the first bishop of Ohio (1819-1831), and after 1833 bishop of Illinois. He graduated at Dartmouth College in 1826, and after studying law under William Wirt, attorney-general of the United States, in Washington, D.C., was admitted to the bar in 1829, and removed to Cincinnati, Ohio, in 1830. Here he soon gained a position of prominence at the bar, and published an annotated edition, which long remained standard, of the laws of Ohio. At a time when public opinion in Cincinnati was largely dominated by Southern business connections, Chase, influenced probably by James G. Birney, associated himself after about 1836 with the anti-slavery movement, and became recognized as the leader of the political reformers as opposed to the Garrisonian abolitionists. To the cause he freely gave his services as a lawyer, and was particularly conspicuous as counsel for fugitive slaves seized in Ohio for rendition to slavery under the Fugitive Slave Law of 1850—indeed, he came to be known as the "attorney-general of fugitive slaves." His argument (1847) in the famous Van Zandt case before the United States Supreme Court attracted particular attention, though in this as in other cases of the kind the judgment was against him. In brief he contended that slavery was "local, not national," that it could exist only by virtue of positive State Law, that the Federal government was not empowered to nullify it, and that "when a slave leaves the jurisdiction of a state he ceases to be a slave, because he continues to be a man and leaves behind him the law which made him a slave." In 1841 he abandoned the Whig party, with which he had previously been affiliated, and for seven years was the undisputed leader of the Liberty party in Ohio; he was remarkably skilful in drafting platforms and addresses, and it was he who prepared the national Liberty platform of 1843 and the Liberty address of 1845. Realizing in time that a third party movement could not succeed, he took the lead during the campaign of 1848 in combining the Liberty party with the Barnburners or Van Buren Democrats of New York to form the Free-Soilers. He drafted the famous Free-Soil platform, and it was largely through his influence that Van Buren was nominated for the presidency. His object, however, was not to establish a permanent new party organization, but to bring pressure to bear upon Northern Democrats to force them to adopt a policy opposed to the further extension of slavery.

In 1849 he was elected to the United States Senate as the result of a coalition between the Democrats and a small group of Free-Soilers in the state legislature; and for some years thereafter, except in 1852, when he rejoined the Free-Soilers, he classed himself as an Independent Democrat, though he was out of harmony with the leaders of the Democratic party. During his service in the Senate (1849-1855) he was pre-eminently the champion of anti-slavery in that body, and no one spoke more ably than he did against the Compromise Measures of 1850 and the Kansas-Nebraska Bill of 1854. The Kansas-Nebraska legislation, and the subsequent troubles in Kansas, having convinced him of the futility of trying to influence the Democrats, he assumed the leadership in the North-west of the movement to form a new party to oppose the extension of slavery. The "Appeal of the Independent Democrats in Congress to the People of the United States," written by Chase and Giddings, and published in the New York Times of the 24th of January 1854, may be regarded as the earliest draft of the Republican party creed. He was the first Republican governor of Ohio,
serving from 1855 to 1859. Although, with the exception of Seward, he was the most prominent Republican in the country, and had done more against slavery than any other Republican, he failed to secure the nomination for the presidency in 1860, partly because his views on the question of protection were not orthodox from a Republican point of view, and partly because the old line Whig element could not forgive his coalition with the Democrats in the senatorial campaign of 1849; his uncompromising and conspicuous anti-slavery record, too, was against him from the point of view of "availability." As secretary of the Treasury in President Lincoln's cabinet in 1861-1864, during the first three years of the Civil War, he rendered services of the greatest value. That period of crisis witnessed two great changes in American financial policy, the establishment of a national banking system and the issue of a legal tender paper currency. The former was Chase's own particular measure. He suggested the idea, worked out all of the important principles and many of the details, and induced Congress to accept them. The success of that system alone warrants his being placed in the first rank of American financiers. It not only secured an immediate market for government bonds, but it also provided a permanent uniform national currency, which, though inelastic, is absolutely stable. The issue of legal tenders, the greatest financial blunder of the war, was contrary to his wishes, although he did not, as he perhaps ought to have done, push his opposition to the point of resigning.

Perhaps Chase's chief defect as a statesman was an insatiable desire for supreme office. It was partly this ambition, and also temperamental differences from the president, which led him to retire from the cabinet in June 1864. A few months later (December 6, 1864) he was appointed chief justice of the United States. Later Supreme Court to succeed Judge Taney, a position which he held until his death in 1873. Among his most important decisions were Texas v. White (7 Wallace, 700), 1869, in which he asserted that the Constitution provided for an "indefectible union composed of indefectible states," Variety Bank v. Penno (8 Wallace, 533), 1869, in defense of that part of the banking legislation of the Civil War which imposed a tax of 10% on the state bank-notes, and Hepburn v. Griswold (8 Wallace, 603), 1869, which declared certain parts of the legal tender acts to be unconstitutional. When the legal tender decision was reversed after the appointment of new judges, 1871-1872 (Legal Tender Cases, 12 Wallace, 457), Chase prepared a very able dissenting opinion. Toward the end of his life he gradually drifted back toward his old Democratic position and made an unsuccessful effort to secure the nomination of the Democratic party for the presidency in 1872. He died in New York city on the 7th of May 1873. Chase was one of the ablest political leaders of the Civil War period, and deserves to be placed in the front rank of American statesmen.

The standard biography is A. B. Hart's Salmon Portland Chase in the "American Statesmen Series" (1890). Less philosophical, but containing a greater wealth of detail, is J. W. Shuckers' Life and Public Services of Salmon Portland Chase (New York, 1874). R. B. Warden's Account of the Private Life and Public Services of Salmon Portland Chase (Cincinnati, 1874) deals more fully with Chase's private life.

CHASE, SAMUEL (1741-1811), American jurist, was born in Somerset county, Maryland, on the 17th of April 1741. He was admitted to the bar at Annapolis in 1765, and for more than twenty years was a member of the Maryland legislature. He took active part in all the debates relating to the Stamp Act, and from 1774 to 1778 and 1783 to 1785 was a member of the Continental Congress. With Benjamin Franklin and Charles Carroll he was sent by Congress in 1776 to win over the Canadians to the side of the revolting colonies, and after his return did much to persuade Maryland to advocate a formal separation of the thirteen colonies from Great Britain, he himself being one of those who signed the Declaration of Independence on the 2nd of August 1776. In this year he was also a member of the convention which framed the first constitution for the state of Maryland. After serving in the Maryland convention which ratified for that state the Federal Constitution, and there

CHASE, S.—CHASING vigorously opposing ratification, though afterwards he was an ardent Federalist, he became in 1791 chief judge of the Maryland general court, which position he resigned in 1796 for that of an associate justice of the Supreme Court of the United States. His radical Federalism, however, led him to continue active in politics, and he took advantage of every opportunity, on the bench and off, to promote the cause of his party. His overbearing conduct while presiding at the trials of John Fries for treason, and of James Thompson Callender (d. 1815) for seditious libel in 1800, drove the lawyers for the defence from the court, and evoked the wrath of the Republicans, who were stirred to action by a political harangue on the evil tendencies of democracy which he delivered as a charge to a grand jury at Baltimore in 1803. The House of Representatives adopted a resolution of impeachment in March 1804, and on the 7th of December 1804 the House managers, chief among whom were John Randolph, Joseph H. Nicholson (1770-1817), and Caesar A. Rodney (1772-1824), laid their articles of impeachment before the Senate. The trial, with frequent interruptions and delays, lasted from the 2nd of January to the 1st of March 1805. Judge Chase was defended by the ablest lawyers in the country, including Luther Martin, Robert Goodloe Harper (1765-1829), Patrick Banton Key (1757-1813), Charles Cotesworth Pinckney (1757-1815), and Joseph Hopkinson (1746-1829). The indictment, in eight articles, dealt with his conduct in the Fries and Callender trials, with his treatment of a Delaware grand jury, and (in article viii.) with his making "highly indecent, extra-judicial" reflections upon the national administration, probably the greatest offence in Republican eyes. On only three articles was there a majority against Judge Chase, the largest, on article viii., being four short of the necessary two-thirds to convict. "The case," says Henry Adams, "proved impeachment to be an impracticable thing for partisan purposes, and it decided the permanence of those lines of constitutional development which were a reflection of the common law." Judge Chase resumed his seat on the bench, and occupied it until his death on the 19th of June 1811.

CHASE, WILLIAM MERRITT (1849— ), American painter, was born at Franklin, Indiana, on the 1st of November 1849. He was a pupil of E. Pomeroy, M. W. Still, J. C. Lewis, and J. O. Eaton in New York, and subsequently of A. Wagner and P. Piloty in Munich. In New York he established a school of his own, after teaching with success for some years at the Art Students' League. A worker in all mediums—oils, water-colour, pastel and etching—painting with distinction the figure, landscape and still-life, he is perhaps best known by his portraits, his sitters numbering some of the most important men and women of his time. Mr Chase won many honours at home and abroad, became a member of the National Academy of Design, New York, and for ten years was president of the Society of American Artists. Among his important canvases are "Ready for the Ride" (Union League Club, N.Y.), "The Apprentice," "Court Jester," and portraits of the painters Whistler and Duveneck; of General Webb and of Peter Cooper.

CHASE. (1) (Fr. chasse, from Lat. caputere, frequentative of capere, to take), the pursuit of wild animals for food or sport (see HUNTING). The word is used of the pursuit of anything, and also of the thing pursued, as, in naval warfare, of a ship. A transferred meaning is that of park land reserved for hunting and game, and hence also, in English, a grove cut to hold a pipe, and, in typography, the frame enclosing the "forme."

CHASING, or EXCLAIMING, the art of producing figures and ornamental patterns, either raised or indented, on metallic surfaces by means of steel tools or punches. It is practised.
extensively for the ornamentation of goldsmith and silversmith work, electro-plate and similar objects, being employed to produce bold flutings and bosses, and in another manner utilized for imitating engraved surfaces. Minute work can be produced by this method, perfect examples of which may be seen in the watch-cases chased by G. M. Moser, R.A. (1704-1783). The chaser first outlines the pattern on the surface he is to ornament, after which, if the work involves bold or high embellishments, these are blocked out by a process termed “snarling.” The snarling iron is a long iron tool turned up at the end, and made so that when securely fastened in a vise the upturned end can reach and press against any portion of the interior of the vase or other object to be chased. The part to be raised being held firmly against the upturned point of the snarling iron, the workman gives the shoulder or opposite end of the iron a sharp blow, which causes the point applied to the work to give it a percussive stroke, and thus throw up the surface of the metal held against the tool. When the blocking out from the interior is finished, or when no such embossing is required, the object to be chased is filled with molten pitch, which is allowed to harden. It is then fastened to a sandbag, and with hammer and a multitude of small punches of different outline the whole details of the pattern, lined, smooth or “matt,” are worked out. Embossing and stamping from steel dies and rolled ornaments have long since taken the place of chased ornamentations in the cheaper kind of work.

**CHASLES, VICTOR EUHÉMÉN PhilARÈTE** (1798-1873), French critic and man of letters, was born at Mainvilliers (Éure et Loir) on the 8th of October 1798. His father, Pierre-Jacques Michel Chasles (1754-1826), was a member of the Convention, and was one of those who voted the death of Louis XVI. He brought up his son according to the principles of Rousseau’s Emile, and the boy, after a régime of outdoor life, followed by some years’ classical study, was apprenticed to a printer, so that he might make himself acquainted with manual labour. His master was employed in one of the plots of 1815, and Philarète suffered two months’ imprisonment. On his release he was sent to London, where he worked for the printer Valpy on editions of classical authors. He wrote articles for the English reviews, and on his return to France did much to popularize the study of English authors. He was also one of the earliest to draw attention in France to S natural history. In 1821 he was the first to publish a work on the subject. His Mémoires (1876-1877) did not fulfill the expectations based on his brilliant talk.

**CHASSE** (from the Fr., in full chasse-café, or “coffee-chaser”), a draught of spirit or liqueur, taken with or after coffee, &c. It consists of a gliding step in dancing, so called since one foot is brought up behind or closes the other. The chasse croisée is a double variety of the step.

**CHASSELOUP-LAUBAT, FRANÇOIS, MARQUIS DE** (1754-1833). French general and military engineer, was born at St Sernin (Lower Charente) on the 18th of August 1754, of a noble family, and entered the French engineers in 1774. He was still a subaltern at the outbreak of the Revolution, becoming captain in 1791. His ability as a military engineer was recognized in the campaigns of 1792 and 1793. In the following year he won distinction in various actions and was promoted successively chef de bataillon and colonel. He was chief of engineers at the siege of Maizy in 1796, after which he was sent to Italy. He there conducted the first siege of Mantua, and reconnoitred the positions and lines of advance of the army of Bonaparte. He was promoted general of brigade before the close of the campaign, and was subsequently employed in fortifying the new Rhine frontier of France. His work as chief of engineers in the army of Italy (1799) was conspicuously successful, and after the battle of Novi he was made general of division. When Napoleon took the field in 1800 to retrieve the disasters of 1799, he again took Chassé as his engineer general. During the Peace of 1801-1805 he was chiefly employed in reconstructing the defences of northern Italy, and in particular the afterwards famous Quadrilateral. His chef d’œuvre was the great fortress of Alessandria on the Tanaro. In 1805 he remained in Italy with Masséna, but at the end of 1806 Napoleon, then engaged in the Polish campaign, called him to the Grande Armée, with which he served in the campaign of 1806-07, directing the sieges of Colberg, Danzig and Stralsund. During the Napoleonic domination in Germany, Chaséou reconstructed many fortresses, in particular Magdeburg. In the campaign of 1809 he again served in Italy. In 1810 Napoleon made him a councillor of state. His last campaign was that of 1812 in Russia. He retired from active service soon afterwards, though in 1814 he was occasionally engaged in the inspection and construction of fortifications. Louis XVIII. made him a peer of France and a knight of St Louis. He refused to join Napoleon in the Hundred Days, and after the Restoration he voted in the chamber of peers against the condemnation of Marshal Ney. In politics he belonged to the constitutional party. The king created him a marquis. Chaséou’s later years were employed chiefly in putting in order his manuscripts, a task which he had to abandon owing to the failure of his sight. His only published work was Correspondance d’un général français, &c., sur divers sujets (Paris, 1801, republished Milan, 1805 and 1811, under the title Correspondance de deux généraux, &c., essais sur quelques parties d’artillerie et de fortification). The most important of his papers are in manuscript in the Dépot de Fortifications, Paris.

As an engineer Chaséou was an adherent, though of advanced views, of the old bastioned system. He followed in many respects the engineer Bousmard, whose work was published in 1797 and who fell, as a Prussian officer, in the defence of Danzig in 1807 against Chaséou’s own attack. His front was applied to Alessandria, as has been stated, and contains many elaborations of his own. In the final flanks of the tenaille, which served as extra flanks of the bastions, the bastion itself was carefully and minutely rethought. The ordinary ravelin he replaced by a heavy casemated caponier after the example of Montalembert, and, like Bousmard’s, his own ravelin was a large and powerful work pushed out beyond the glacis.

**CHASSEPOT,** officially “fusil modèle 1866,” a military breech-loading rifle, famous as the arm of the French forces in the Franco-German War of 1870-71. It was so called after its inventor, Antoine Alphonse Chassépot (1833-1905), who, from 1857 onwards, had constructed various experimental forms of breechloader, and it became the French service weapon in 1866. In the following year it made its first appearance on the battlefield at Montaum (November 9th, 1867), where it inflicted severe losses upon Garibaldi’s troops. In the war of 1870 it proved very greatly superior to the German needle-gun. The breech was opened by a bolt very similar to that of modern rifles, and amongst the technical features of interest were the method of obturation, which was similar in principle to the de Bange obturator for heavy guns (see ORDINANCE), and the retention of the paper cartridge. The principal details of the chassepot are:—weight of rifle, 9 lb 5 oz; length with bayonet, 6 ft 2 in.; calibre, .433 in.; weight of bullet (lead), 386 grains; weight of charge (black powder), 86-4 grains; muzzle velocity, 1385 f.s.; sighted to 1312 yds. (1200 m.). The chassepot was replaced in 1874 by the Gras rifle, which had a metal cartridge, and all rifles of the older model remaining in store were converted to take the same ammunition (fusil modèle 1866-74).

**CHASSÉRIAU, THÉODORE** (1810-1856), French painter, was born in the Antilles, and studied under Ingres at Paris and
at Rome, subsequently falling under the influence of Paul Delaroche. He was a well-known painter of portraits and historical pieces, his "Teptaridum at Pompeii" (1853) being now in the Louvre.

CHASSIS (Fr. chasis, a frame, from the Late Lat. capsum, an enclosed space), properly a window-frame, from which is derived the word "sash"; also the movable traversing frame of a gun, and more particularly that part of a motor vehicle consisting of the wheels, frame and machinery, on which the body or carriage part rests.

CHASTELARD, PIERRE DE BOCOSZEL DE (1450-1503), French poet, was born in Dauphiné, a scion of the house of Bayard. His name is inseparably connected with Mary, queen of Scots. From the service of the Constable Montmorency, Chastellard, then a page, passed to the household of Marshal Damville, whom he accompanied in his journey to Scotland in escort of Mary (1561). He returned to Paris the marshal's train, but left for Scotland again shortly afterward, bearing letters of recommendation to Mary from his old protector, Montmorency, and the Regrets addressed to the ex-queen of France by Pierre Ronsard, his master in the art of song. He undertook to transmit to the poet the service of plate which Mary rewarded him. But he had fallen in love with the queen, who is said to have induced his passion. Copies of verse passed between them; she lost no occasion of showing herself partial to his person and conversation. The young man hid himself under her bed, where he was discovered by her maids of honour. Mary pardoned the offence, and the old familiar terms between them were resumed. Chastellard was so roused as again to violate her privacy. He discovered a second time, seized, sentenced and hanged the next morning. He met his fate valiantly and consistently, reading, on his way to the scaffold, his master's noble Hymne de la mort, and turning at the instant of doom towards the palace of Holyrood, to address to his unseen mistress the famous farewell—"Adieu, toi si belle et si cruelle, qui me tues et que je ne puis cesser d'aimer." This at least is the version of the Mémoires de Brantôme, who is, however, notoriously untrustworthy. But for his madness of love, it is possible that Chastellard would have left no shadow or shred of himself behind. As it is, his life and death are of interest as illustrating the wild days in which his lot was cast.

CHASTELAIN, GUILLAUME (d. 1475), Burgundian chronicler, was a native of Alencourt in Flanders. He derived his surname from the fact that his ancestors were burgraves or châtelains of the town; his parents, who belonged to illustrious Flemish families, were probably the Jean Chastellain and his wife Marie de Massines mentioned in the town records in 1425 and 1432. A copy of an epitaph originally at Valenciennes states that he died on the 20th of March 1474-5 aged seventy.

CHASTEY—CHASTELLAIN

Citeriderable pension, on condition that the recipient should put in writing "chooses nouvelles et morses," and a chronicle of notable events. This is to be speedily finished. The book is being written in Burgundy by Chastellain, the biographer with a recommendation to write also on other subjects not strictly within the scope of a chronicler. From this time he worked hard at his Chronique, with occasional interruptions in his retreat to fulfil missions in France, or to visit the Burgundian court.

At Calais, on the 15th of February (according to the treasury accounts), or on the 20th of March (according to his epigraph) 1475, he died at Valenciennes. He left an illegitimate son, to whom was paid in 1524 one hundred and twenty livres for a copy of the Chronique intended for Charles V.'s sister Mary, queen of Hungary. Only about one-third of the whole work, which extended from 1419 to 1474, is known to be in existence, but MSS. carried by the Habsburgs to Spain are now in Madrid. The body of Chastellain was buried in the Louvre.

Among his contemporaries Chastellain acquired a great reputation by his poems and occasional pieces now little considered. The unfinished state of his Chronique at the time of his death, coupled with political considerations, may possibly account for the fact that it remained unprinted during the century that followed his death, and his historical work was only disinterred from the libraries of Arras, Paris and Brussels by the painstaking researches of M. Buchon in 1825. Chastellain was constantly engaged during the earlier part of his career in negotiations between the French and Burgundian courts, and thus had personal knowledge of the persons and events dealt with in his history. A partisan element in writing of French affairs was inevitable in a Burgundian chronicle. This defect appears most strongly in his treatment of Joan of Arc; and the attack on Agnes Sorel seems to have been dictated by the dauphin (afterwards Louis XI.), then a refugee in Burgundy, of whom he was afterwards to become a severe critic. He was not, however, misled, as his more picturesque predecessor Froissart had been, by feudal and chivalric tradition into misconception of the achievements of the Habsburgs in France; and except in isolated instances where Burgundian interests were at stake, he did full justice to the patriotism of Frenchmen. Among his most sympathetic portraits are those of his friend Pierre de Brézé and of Jacques Cœur. His French style, based partly on his Latin reading, has, together with its undeniable vigour and picturesqueness, the characteristic redundance and rhetorical quality of the Burgundian school.

Chastellain was no mere annalist, but proposed to fuse and shape his vast material to his own conclusions, in accordance with his political experience. The most interesting feature of his work is the skill with which he pictures the leading figures of his time. His "characters" are the fruit of acute and experienced observation, and abound in satirical traits, although the 42nd chapter of his second book, devoted expressly to portraiture, is headed "Comment Georges escriit et mentionne les louanges vertueuses des princes de son temps."

The known extant fragments of Chastellain's Chroniques with his other works were edited by Kervyn de Lettenhove for the Brussels Academy in 1863-1886 (8 vols., Brussels) as Œuvres de Georges Chastellain. This edition includes all that had been already published by Buchon in his Collection de chroniques and Choix de poèmes. (material subsequently incorporated in the Panthéon littéraire), and portions printed by Renard in his Trésor national, vol. i. and by Quicherat in the Procès de la Paluelle vol. iv. Kervyn de Lettenhove's text includes the portions of the chronicle covering the periods September 1419, October 1422, January 1450 to December 1450, July 1452 to October 1452, and November 1453, with, and, with omissions, June 1467 to September 1470; and three volumes of minor pieces of considerable interest, especially Le Temple de Bocace, dedicated to Margaret of Anjou, and the Dépréciation pour Pierre Brézé, imprisoned by Louis XI. In the case of these minor works the attribution to Chastellain is in some cases erroneous, notably in the case of the Livre des faits de Jacques de Lalaing, which
is the work of Lefèbre de Saint-Remi, herald of the Golden Fleece.

In the allegorical Outre d'amour it has been thought a real romance between Brézé and a lady of the royal house is concealed.

See A. Molnir, Les Sources de l'histoire de France; as well as notices by Kerény de Lettenhove prefixed to the Oeuvres and in the Biographie nationale de Belgique; and an article (three parts) by Vallet de Virville in the Journal des savants (1867).

CHASUBLE (Fr. chasuble, Ger. Kasel, Span. casulla; Late Lat. casula, a little house, hut, from casa), a liturgical vestment of the Catholic Church. It is the outermost garment worn by bishops and priests at the celebration of the Mass, forming with the alb (q.v.) the most essential part of the eucharistic vestments. Since it is only used at the Mass, or rarely for functions intimately connected with the sacrament of the altar, it may be regarded as the Mass vestment par excellence. The chasuble is thus in a special sense the sacerdotal vestment, and at the ordination of priests, according to the Roman rite, the bishop places on the candidate a chasuble rolled up at the back (planeta plicata), with the words, "Take the sacerdotal robe, the symbol of love," &c.; at the end of the ordination Mass the vestment is unrolled.

The chasuble or planeta (as it is called in the Roman missal), according to the prevailing model in the Roman Catholic Church, is a scapular-like cloak, with a hole in the middle for the head, falling down over breast and back, and leaving the arms uncovered at the sides. Its shape and size, however, differ considerably in various countries (see fig. 1), while some churches—e.g. those of certain monastic orders—have retained or reverted to the earlier "Gothic" forms to be described later. According to the decisions of the Congregation of Rites chasubles must not be of linen, cotton or woolen stuffs, but of silk; though a mixture of wool (or linen and cotton) and silk is allowed if the silk completely cover the other material on the outer side; spun glass thread, as a substitute for gold or silver thread, is also forbidden, owing to the possible danger to the priest's health from broken fragments falling into the chalice.

The chasuble, like the kindred vestments (the châle, &c.) in the Eastern Churches, is derived from the Roman paenula or planeta, a cloak worn by all classes and both sexes in the Graeco-Roman world (see Vestments). Though early used in the celebration of the liturgy it had for several centuries no specifically liturgical character, the first clear instances of its ritual use being in a letter of St Germanus of Paris (d. 576), and the next in the twenty-eighth canon of the Council of Toledo (633).

Much later than this, however, it was still an article of everyday clerical dress, and as such was prescribed by the German council convened by Carolman and presided over by St Boniface in 742. Amalarius of Metz, in his De ecclesiasticis officiis (ii. 19), tells us in 816 that the casula is the generale indumentum sacerdotii et coram domo and is proper generally to all the clergy. It was not until the 12th century, when the cope (q.v.) had become established as a liturgical vestment, that the chasuble began to be reserved as special to the sacrifice of the Mass. As illustrating this process Father Braun (p. 170) cites an interesting correspondence between Archbishop Lanfranc of Canterbury and John of Avranches, archbishop of Rouen, as to the propriety of a bishop wearing a chasuble at the consecration of a church, Lanfranc maintaining as an established principle that the vestment should be reserved for the Mass. By the 13th century, with the final development of the ritual of the Mass, the chasuble became definitely fixed as the vestment of the celebrating priest; though to this day in the Roman Church relics of the earlier general use of the chasuble survive in the planeta plicata worn by deacons and subdeacons in Lent and Advent, and other penitential seasons.

At the Reformation the chasuble was rejected with the other vestments by the more extreme Protestants. Its use, however, survived in the Lutheran churches; and though in those of Germany it is no longer worn, it still forms part of the liturgical costume of the Scandinavian Evangelical churches. In the Church of England, though it was prescribed alternatively with the cope in the First Prayer-Book of Edward VI., it was ultimately discarded, with the other "Mass vestments," the cope being substituted for it at the celebration of the Holy Communion in cathedral and collegiate churches; its use has, however, during the last fifty years been widely revived in connexion with the reactionary movement in the direction of the pre-Reformation doctrine of the eucharist. The difficult question of its legality is discussed in the article Vestments.

Form.—The chasuble was originally a tent-like robe which fell in loose folds below the knee (see Plate i. fig. 4). Its obvious inconvenience for celebrating the holy mysteries, however, caused its gradual modification. The object of the change was primarily to leave the hands of the celebrant freer for the careful performance of the manual acts, and to this end a process of cutting away at the sides of the vestment began, which continued until the tent-shaped chasuble of the 12th century had developed in the 16th into the scapular-like vestment at present in use. This process was, moreover, hastened by the substitution of costly and elaborately embroidered materials for the simple stuffs of which the vestment had originally been composed; for, as it became heavier and stiffer, it necessarily had to be made smaller. For the extremely exiguous proportions of some chasubles actually in use, which have been robbed of all the beauty of form they ever possessed, less respectable motives have sometimes been responsible, viz. the desire of their makers to save on the materials. The most beautiful form of the chasuble is undoubtedly the "Gothic" (see the figure of Bishop Johannes of Lübeck in the article Vestments), which is the form most affected by the Anglican clergy, as being that worn in the English Church before the Reformation.

Decoration.—Though planetae decorated with narrow orphreys are occasionally met with in the monuments of the early centuries, these vestments were until the 10th century generally quite plain, and even at the close of this century, when the custom of decorating the chasuble with orphreys had become common, there was no definite rule as to their disposition; sometimes they were merely embroidered borders to the neck-opening or hem, sometimes a vertical strip down the back, less often a forked cross, the tops of which turned upward; sometimes over the shoulders. From this time onward, however, the embroidery became ever more and more elaborate, and with this tendency the orphreys were broadened to allow of their being decorated with figures. About the middle of the 13th century, the cross with horizontal arms begins to appear on the back of the vestment, and by the 15th this had become the most usual form, though the forked cross also survived—e.g. in England, where it is now considered distinctive of the chasuble as worn in the Anglican Church. Where the forked cross is used it is placed both on the back and front of the vestment; the horizontal-armed cross, on the other hand, is placed only on the back, the front being decorated with a vertical strip extending to the lower hem (fig. 1, b, d). Sometimes the back of the chasuble has no cross, but only a vertical orphrey, and in this case the front, besides the vertical stripe, has a horizontal orphrey just below
the neck opening (see Plate I. fig. 2). This latter is the type used in the local Roman Church, which has been adopted in certain dioceses in South Germany and Switzerland, and of late years in the Roman Catholic churches in England, e.g. Westminster cathedral (see Plate I. figs. 3 and 5).

It has been widely held that the forked cross was a conscious imitation of the archbishop pallium (F. Bock, Gesch. der liturg. Gewänder, ii. 107), and that the chasuble so decorated is a return to archetypes. It is shown, however, how quite clear it was not the case, and gives proof that this decoration was not even originally conceived as a cross at all, citing early instances of its having been worn by laymen and even by non-Christians (p. 216). It was not until the 13th century that the symbolic meaning of the cross began to be elaborated, and this was still further accentuated from the 14th century onward by the increasingly widespread custom of adding to it the figure of the crucified Christ and other symbols of the Passion. This, however, did not represent any definite rule; and the orphreys of chasubles were decorated with a great variety of pictorial subjects, scriptural or drawn from the stories of the saints, while the rest of the vestment was either left plain or, if embroidered, most usually decorated with arabesque patterns of foliage or animals. The local Roman Church, true to its ancient traditions, adhered to the simpler forms. The modern Roman chasuble pictured in Plate I. fig. 5, besides the conventional arabesque pattern, is decorated, according to rule, with the same colour and arrangement and froth the 13th century.

The Eastern Church. — The original equivalent of the chasuble is the phelonion (φθόλιον, φθόλης, φανέλιον, from paenula). It is a full vestment of the type of the Western bell chasuble; but, instead of being cut away at the sides, it is for convenience sake either gathered up or cut short in front. In the Armenian, Syrian, Chaldaean and Coptic rites it is cope-shaped. There is some difference of opinion as to the derivation of the vestment in the latter case; the Five Bishops (Report to Convocation, 1908) deriving it, like the cope, from the birrus, while Father Braun considers it, as well as the cope, to be a modification of the paenula. 1 The phelonion (Arm. shurtschar, Syr. phaina, Chald. maapfro or phaina, Copt. burnus, jelonion, küklión) is confined to the priests in the Armenian, Syrian, Chaldaean and Coptic rites; in the Greek rite it is worn also by the lectors. It is not in the East so specifically a eucharistic vestment as in the West, but is worn at other solemn functions besides the liturgy, e.g. marriages, processions, &c.

Until the 13th century the phelonion is always pictured as a perfectly plain dark robe, and at this period the custom arose of decorating the patriarchal phelonion with a number of crosses, whence its name of phaonoiaros. By the 14th century the use of these polystauria had been extended to metropolitans and later still to all bishops. The purple or black phelonion, however, remained plain in all cases. The Greeks and Greek Melchite metropolitans now wear the sakkos instead of the phelonion; and in the Russian, Ruthenian, Bulgarian and Italo-Greek churches this vestment has superseded the phelonion in the case of all bishops (see Dalmatic and Vestments).

See J. Braun, S.J., Die liturgische Gewandung (Freiburg im Breisgau, 1907), pp. 149-247, and the bibliography to the article Vestments. (W. A. P.)

1 The writer is indebted to the courtesy of Father Braun for the following note:— That the Syrian phaina was formerly a closed mantle of the type of the bell chasuble is clearly proved by the evidence of the miniatures of a Syrian pontifical (dated 1239) in the Bibliothèque Nationale at Paris (cf. Bild 16, 112, 284, in Die liturgische Gewandung). The liturgical vestments of the Armenians are derived from the Greek rites from the Greek phelonion, and from the paenula, both as worn by soldiers and in ordinary life, was, like the modern Arab burnus, often slit up to the front of the neck. For the rest, it is obvious that if the Syrian phaina was still quite closed in the 13th century, and was only provided with a slit since that time, the same is very probable in the case of the Armenian chasuble. The absence of the hood might also be taken as additional proof of

CHATEAU—CHATEAUBRIAND

CHATEAU (from Lat. castellum, fortress, through O. Fr. chastele, chateau), the French word for castle (q.v.). The development of the medieval castle, in the 15th and 16th centuries, into houses arranged rather for residence than defence led to a corresponding widening of the meaning of the term château, which came to be applied to any seignorial residence and so generally to all houses, especially country houses, of any pretensions (cf. the Ger. Schloss). The French distinguish the feudal castle from the residential mansion by describing the former as the château fort, the latter as the château de plaisance. The development of the one into the other is admirably illustrated by surviving buildings in France, especially in the châteaux scattered along the Loire. Of these Langeais, still in perfect preservation, is a fine type of the château fort, with its 10th-century keep and 13th-century walls. Amboise (1490), Blois (1500-1540), Chambord (begun 1526), Chenonceaux (1515-1560), Azay-le-Rideau (1521), may be taken as typical examples of the château de plaisance of the transition period, all retaining in greater or less degree some of the architectural characteristics of the medieval castle. Some description of these is given under their several headings. In English the word château is often used to translate foreign words (e.g. Schloss) meaning country house or mansion.

For the Loire châteaux see Theodore Andrea Cook, Old Touraine (1892).

CHATEAUBRIAND, FRANÇOIS RENÉ, VICE-AMIRAL DE (1768-1848), French author, youngest son of René Auguste de Chateaubriand, comte de Combourg, 2 was born at St Malo on the 18th September 1768. He was a brilliant representative of the reaction against the ideas of the French Revolution, and the most conspicuous figure in French literature during the First Empire. His naturally poetical temperament was fostered in childhood by picturesque influences, the mysterious reserve of his morose father, the ardent piety of his mother, the traditions of his ancient family, the legends and antiquated customs of the sequestered Breton district, above all, the vagueness and solemnity of the neighbouring ocean. His closest friend was his sister Lucile, 3 a passionate-hearted girl, divided between her devotion to him and to religion. François received his education at Dol and Rennes, where Jean Victor Moreau was among his fellow-students. From Rennes he proceeded to the College of Dinan, and passed some years in desultory study in preparation for the priesthood. He finally decided, after a year's holiday at the family château of Combourg, that he had no vocation for the Church, and was on the point of proceeding to try his fortune in India when he received (1786) a commission in the army. A short visit to Paris he joined his regiment at Cambrai, and early in the following year was presented at court. In 1788 he received the pension in order to enter the order of the Knights of Malta. In Paris (1787-1789) he made acquaintance with the Parisian men of letters. He met la Harpe, Évariste Parny, “Pindare” Lebrun, Nicolas Chamfort, Pierre Louis Gingué, and others, of whom he has left portraits in his memoirs.

Chateaubriand was not unfavourable to the Revolution in its first stages, but he was disturbed by its early excesses; moreover, his regiment was disbanded, and his family belonged to the party of reaction. His political impartiality, he says, pleased no one. These causes and the restlessness of his spirit induced him to take part in a romantic scheme for the discovery of the North-West Passage, in pursuance of which he departed for America in the spring of 1791. The passage was not found or even attempted, but the adventurer returned enriched with the— to him—more important discovery of his own powers and vocation, conscious of his marvellous faculty for the delineation of nature, and stored with the new ideas and new imagery, the derivation of the phaina from the paenula, but I should not lay particular stress upon it. The question is settled by the above-mentioned minutes. 4

derived from the virgin forests and magnificent scenery of the western continent. That he actually lived among the Indians, however, is shown by Bédier to be doubtful, and the same critic has exposed the untrustworthiness of the autobiographical details of his American trip. His knowledge of America was mainly derived from the books of Charlevoix and others.

The news of the arrest of Louis XVI. at Varennes in June 1791 recalled him to France. In 1792 he married Mlle Céleste Buisson de Lavigne, a girl of seventeen, who brought him a small fortune. This enabled him to join the ranks of the emigrants, a course practically imposed on him by his birth and his profession as a soldier. After the failure of the duke of Brunswick's invasion he contrived to reach Brussels, where he was left wounded and apparently dying in the street. His brother succeeded in obtaining some shelter for him, and sent him to Jersey. The captain of the boat in which he travelled left him on the beach in Guernsey. He was once more rescued from death, this time by some fishermen. After spending some time in the Channel Islands under the care of an ignorant uncle, the comte de Bédé, he made his way to London. In England he lived obscurely for several years, gaining an intimate acquaintance with English literature and a practical acquaintance with poverty. His own account of this period has been exposed by A. le Braz, Au pays d'exil de Chateaubriand (1900), and by E. Dick, Revue d'histoire littéraire de la France (1908), i. From his English exile dates the *Nuiches* (first printed in his *Œuvres complètes*, 1826–1831), a prose epic designed to portray the life of the Red Indians. Two brilliant episodes originally designed for this work, *Atala* and *René*, are among his most famous productions. Chateaubriand's first publication, however, was the *Essai historique, politique et moral sur les révolutions...* (London, 1797), which the author subsequently retracted, but took care not to suppress. In this volume he appears as a mediator between royalist and revolutionary ideals, a free-thinker in religion, and a philosopher imbued with the spirit of Rousseau's social great change in his views was, however, at hand, induced, according to his own statement, by a letter from his sister Julie (Mme de Farcy), telling him of the grief his views had caused her mother, who had died soon after her release from the Conciergerie in the same year. His brother had perished on the scaffold in April 1794, and both his sisters, Lucile and Julie, and his wife had been imprisoned at Rennes. Mme de Farcy did not long survive her imprisonment.

Chateaubriand's thoughts turned to religion, and on his return to France in 1800 the *Génie du christianisme* was already in an advanced state. Louis de Fontaines had been a fellow-exile with Chateaubriand in London, and he now introduced him to the society of Mme de Stael, Mme Récamier, Benjamin Constant, Lucien Bonaparte and others. But Chateaubriand's favourite resort was the salon of Pauline de Beaumont, who was destined to fill a great place in his life, and gave him some help in the preparation of his work on Christianity, part of the book being written at her house at Lavigne. *Atala, ou les amours des sauvages dans le désert*, used as an episode in the *Génie du christianisme*, appeared separately in 1801 and immediately made his reputation. Exquisite style, impassioned eloquence and glowing descriptions of nature gained indulgence for the incongruity between the ruggedness of the personages and the refinement of the sentiments, and for the distasteful blending of prudery with sensuousness. Alike in its merits and defects the piece is a more emphatic and highly coloured *Paul et Virginie*; it has been justly said that Bernardin Saint-Pierre models in marble and Chateaubriand in bronze. Encouraged by his success the author resumed his *Génie du christianisme*, ou *beautés de la religion chrétienne*, which appeared in 1802, just upon the eve of Napoleon's re-establishment of the Catholic religion in France, for which it thus seemed almost to have prepared the way. No coincidence could have been more opportune, and Chateaubriand came to esteem himself the counterpart of Napoleon in the intellectual order. In composing his work he had borne in mind the admonition of his friend Joseph Joubert, that the public would care very little for his erudition and very much for his eloquence. It is consequently an inefficient production from the point of view of serious argument. The considerations derived from natural theology are but commonplace rendered dazzling by the magic of style; and the parallels between Christianity and antiquity, especially in arts and letters, are at best ingenious sophistries. The less polemical passages, however, where the author depicts the glories of the Catholic liturgy and its accessories, or expounds its symbolic significance, are splendid instances of the effect produced by the accumulation and judicious distribution of particulars gorgeous in the mass, and treated with the utmost refinement of detail. The work is a masterpiece of literary art, and its influence in French literature was immense. The *Élue de Alfred de Vigny, the Harmonies of Lamartine and even the *Légende des siècles* of Victor Hugo may be said to have been inspired by the *Génie du christianisme*. Its immediate effect was very considerable. It admirably subserved the statecraft of Napoleon, and Talleyrand in 1803 appointed the writer *attaché* to the French legation at Rome, which he was followed by Mme de Beaumont, who died there.

When his insubordinate and intriguing spirit compelled his recall he was transferred as envoy to the canto of the Valais. The murder of the duke of Enghien (21st of March 1804) took place before he took up this appointment. Chateaubriand, who was in Paris at the time, showed his courage and independence by immediately resigning his post. In 1807 he gave great offence to Napoleon by an article in the *Mercure de France* (4th of July), containing allusions to Nero which were rightly taken to refer to the emperor. The *Mercure*, of which he became proprietor, was temporarily suppressed, and was in the next year amalgamated with the *Décade*. Chateaubriand states in his *Mémoires* that his life was threatened, but it is more possible that he exaggerated the danger. Before this, in 1806, he made a pilgrimage to Jerusalem, undertaken, as he subsequently acknowledged, less in a devotional spirit than in quest of new imagery. He returned by way of Tunis, Carthage, Cadiz and Granada. At Granada he met Mme de Mouchy, and the place and the meeting apparently suggested the romantic tale of *Le Dernier Abencérage*, which, for political reasons, remained unprinted until the publication of the *Œuvres complètes* (1826–1831). The journey also produced *L'itinéraire de Paris à Jérusalem...* (3 vols., 1811), a record of travel distinguished by the writer's habitual picturesque; and inspired his prose epic, *Les Martyrs, ou le triomphe de la religion chrétienne* (2 vols., 1809).

This work may be regarded as the argument of the *Génie du christianisme* thrown into an objective form. As in the *Epître* of Thomas Moore, the professed design is the contrast between Paganism and Christianity, which fails of its purpose partly from the absence of real insight into the genius of antiquity, and partly because the heathen are the most interesting characters after all. *René* had appeared in 1802 as an episode of the *Génie du christianisme*, and was published separately at Leipzig without its author's consent in the same year. It was perhaps Chateaubriand's most characteristic production. The connecting link in European literature between *Werther* and *Childe Harold*, it paints the miseries of a morbid and disconsolate soul. The representation is mainly from the life. Chateaubriand betrayed amazing egotism in describing his sister Lucile in the *Amélie* of the story, and much is obviously descriptive of his own early surroundings. With *Les Natchez* his career as an imaginative writer is closed. In 1831 he published his *Études ou discours historiques*... (4 vols.) dealing with the fall of the Roman Empire.

As a politician Chateaubriand was equally formidable to his antagonists when in opposition and to his friends when in office. His poetical receptivity and impressionableness rendered him no doubt honestly inconsistent with himself; his vanity and ambition, too morbidly acute to be restrained by the ties of party allegiance, made him dangerous and untrustworthy as a political associate. He was forbidden to deliver the address he had prepared (1811) for his reception to the Academy on M. J. Chénier on account of the bitter allusions to Napoleon contained in it. From this date until 1814 Chateaubriand lived in seclusion at
the Vallée-aux-loUPS, an estate he had bought in 1807 at Aulnay. His pamphlet De Bonaparte, des Bourbons, et de la nécessité de se rallier à nos princes légitimes, published on the 31st of March 1814, the day of the entrance of the allies into Paris, was at

opportune in the moment of its appearance as the Génie du christianisme, and produced a hardly less signal effect. Louis XVIII. declared that it had been worth a hundred thousand men to him. Chateaubriand, as minister of the interior, accompanied him to Ghent during the Hundred Days, and for a time associated himself with the excesses of the royalist reaction. Political bigotry, however, was not among his faults; he rapidly drifted into liberalism and opposition, and was disgraced in September 1816 for his pamphlet De la monarchie selon la carte. He had to sell his library and his house of the Vallée-aux-lopS.

After the fall of his opponent, the duc Decazes, Chateaubriand obtained the Berlin embassy (1821), from which he was transferred to London (1822), and he also acted as French plenipotentiary at the Congress of Verona (1822). He here made himself mainly responsible for the iniquitous invasion of Spain—an expedition undertaken, as he himself admits, with the idea of restoring French prestige by a military parade. He next received the portfolio of foreign affairs, which he soon lost by his desertion of his colleagues on the question of a reduction of the interest on the national debt. After another interlude of effective pamphleteering in opposition, he accepted the embassy to Rome in 1827, under the Martinigan administration, but resigned it at Prince Polignac's accession to office. On the downfall of the elder branch of the Bourbons, he made a brilliant but inevitably fruitless protest from the tribune in defence of the principle of legitimacy. During the first half of Louis Philippe's reign he was still politically active with his pen, and published a Mémoire sur la captivité de madame la duchesse de Berry (1833) and other pamphlets in which he made himself the champion of the exiled dynasty; but as years increased upon him, and the prospect of his again performing a conspicuous part diminished, he relapsed into an attitude of complete discouragement. His Congrès de Véronne (1838), Vie de Rancé (1844), and his translation of Milton, Le Paradis perdu de Milton (1836), belong to the writings of these later days. He died on the 4th of July 1848, wholly exhausted and thoroughly despondent with himself and the world, but affectionately tended by his old friend Madame Récamier, herself deprived of sight. For the last fifteen years of his life he had been engaged in his Mémoires, and his chief distraction had been his daily visit to Madame Récamier, at whose house he met the European celebrities. He was buried in the Grand Bé, an islet in the bay of St. Malo. Shortly after his death his memory was revived, and at the same time exposed to much adverse criticism, by the publication, with sordid mutilations as has been suspected, of his celebrated Mémoires d'autres temps (12 vols., 1849-1850). These memoirs undoubtedly reveal his vanity, his egotism, the frequent hollowness of his professed convictions, and his incapacity for sincere attachment, except, perhaps, in the case of Madame Récamier. Though the book must be read with the greatest caution, especially in regard to persons with whom Chateaubriand came into collision, it is perhaps now the most read of all his works.

Chateaubriand ranks rather as a great orator than as a great poet. Something of affectation or unreality commonly interferes with the enjoyment of his finest works. The Génie du christianisme is a brilliant piece of special pleading; Atala is marred by its unfaithfulness to the truth of uncivilized human nature, René by the perversion of sentiment which solicits sympathy for a contemptible character. Chateaubriand is chiefly significant as marking the transition from the old classical to the modern romantic school. The variety of ideas, the mixture of expression and luxury of natural description, which he shares with the romanticists, are controlled by a discipline learnt in the school of their predecessors. His palette, always brilliant, is never gaudy; he is not merely a painter but an artist. He is also a master of epigrammatic and incisive sayings. Perhaps, however, the most truly characteristic feature of his genius is the peculiar magical touch which Matthew Arnold indicated as a

note of Celtic extraction, which reveals some occult quality in a familiar object, or tinges it, one knows not how, with "the light that never was on sea or land." This incommunicable gift supplies an element of sincerity to Chateaubriand's writings which goes far to redeem the artificial effect of his calculated sophistry and set declamation. It is also fortunate for his fame that so large a part of his writings should directly or indirectly refer to himself, for on this theme he always writes well. Egotism was his master-passion, and beyond his intrepidness and the lof

miness of his intellectual carriage his character presents little to admire. He is a signal instance of the compatibility of genuine poetic emotion, of sympathy with the grander aspects both of man and nature, and of munificence in pecuniary matters, with absorption in self and general sterility of heart.

BIBLIOGRAPHY.—The (Études completes de Chateaubriand were published posthumously in 48 vols., 1851-1854, and in many later editions, notably in 1858-1861, in 20 volumes, with an introductory study by Sainte-Beuve. The principal authority for Chateaubriand's biography is the Mémoires d'autre-tombe (1849-1850), of which there is an English translation, The Memoirs of ... Chateaubriand (6 vols., 1902), by A. Teixeira de Mattos, based on the admirable edition (4 vols., 1899-1901) of Edmond Biré. This work should be supplemented by the Souvenirs et correspondances littéraires de Chateaubriand (Mme. Récamier, 1850, ed. M. Vaizey), and by Mme. Récamier, Lettres de Chateaubriand et de Mme. Récamier (4 vols., 1872); and, as before, the same editor's Souvenirs diplomatiques; correspondance intime de Chateaubriand (1858); C. A. Sainte-Beuve, Chateaubriand et son temps (2 vols., 1849), an edition of his Correspondance publique et privée (4 vols., 1871), and, later, tipped with Joseph Bedier, Études critiques (1903), deals with the American writings. Some correspondence with Sainte-Beuve was edited by Louis Thomas in 1904, and some letters to Mme de Staël appeared in the Revue des deux mondes (1823).

CHÂTEAUBRIANT, a town of western France, capital of an arrondissement in the department of Loire-Inférieure, on the left bank of the Chère, 40 m. N.N.E. of Nantes by rail. Pop. (1906) 5969. Chateaubriant takes its name from a castle founded in the 11th century by Brien, count of Penthievre, remains of which, consisting of a square donjon and four towers, still exist. Adjoining it is another castle, built in the first half of the 16th century by Jean de Laval, and famous in history as the residence of François de Foix, mistress of Francis I. Of this the most beautiful feature is the colonnade running at right angles to the main building, and connecting it with a graceful pavilion. It is occupied by a small museum and some of the public offices. There is also an interesting Romanesque church dedicated to St. Jean, de 1676. Chateaubriant is the seat of a subprefecture and has a tribunal of first instance. It is an important centre on the Ouest-Etat railway, and has trade in agricultural products. The manufacture of leather, agricultural implements and preserved angelica are carried on. In 1552 Henry II. signed an edict against the reformed religion at Chateaubriant.

CHÂTEAUBRIANT, a town of north central France, capital of an arrondissement in the department of Eure-et-Loir, 28 m. S.S.W. of Chartres by rail. Pop. (1906) 5805. It stands on an eminence near the left bank of the Loire. The streets, which are straight and regular, radiate from a central square, a uniformity due to the reconstruction of the town after fires in 1723 and 1870. The château, the most remarkable building in the town, was built in great part by Jean, count of Dunois, and his descendants. Founded in the 10th century, and rebuilt in the 12th and 13th centuries, it consists of a principal group of buildings of the 16th century and a smaller wing adjoining by a chapel. To the left of the courtyard thus formed rises a lofty keep of the 12th century. The fine apartments and huge kitchens of the château are in keeping with its imposing exterior. The church of La Madeleine dates from the 12th century; the buildings of the abbey to which it belonged are occupied by the subprefecture, the law court and the hospital. The medieval churches of St. Valéryen and St. Jean...
CHÂTEAU-GONTIER—CHÂTEAURoux

and the ruined chapel of Notre-Dame du Champé, of which the façade in the Renaissance style now forms the entrance to the cemetery, are other notable buildings. The public institutions include a tribunal of first instance and a communal college. Flour-milling, tanning and leather-dressing, and the manufacture of blankets, silver jewelry, nails and machinery are the prominent industries. Trade is in cattle, grain, wool and hemp. Châteaudun (Castrodatum), which dates from the Gallo-Roman period, was in the middle ages the capital of the countship of Dunois.

CHÂTEAU-GONTIER, a town of western France, capital of an arrondissement in the department of Mayenne, on the Mayenne, 18 m. S. by E. of Laval by road. Pop. (1866) 6871. Of its churches, that of St Jean, a relic of the castle, dates from the 11th century. Château-Gontier is the seat of a sub-prefect and has a tribunal of first instance, a communal college for boys and a small museum. It carries on wool- and cotton-spinning, the manufacture of serge, flannel and oil, and is an agricultural market. There are chalybeate springs close to the town. Château-Gontier owes its origin and its name to a castle erected in the first half of the 11th century by Gunther, the steward of Fulk Nerra of Anjou, on the site of a farm belonging to the monks of St Aubin d'Angers. On the extinction of the family, the lordship was assigned by Louis XI. to Philippe de Comines. The town suffered severely during the wars of the League. In 1593 it was occupied by the Vendéens.

CHÂTEAUREUX, LA BELLE, the name popularly given to Renée de Rieux, daughter of Jean de Rieux, seigneur de Châteauneuf, who descended from one of the greatest families of Brittany. The dates both of her birth and death are not known. She was maid of honour to the queen-mother Catherine de'Medici, and inspired an ardent passion in the duke of Anjou, brother of Charles IX. This intrigue deterred the duke from the marriage which it was desired to arrange for him with Elizabeth of England; but he soon abandoned La Belle Châteauneuf for Marie of Cleves (1571). The court then wished to find a husband for Renée de Rieux, whose singular beauty gave her an influence which the queen-mother feared, and matches were in turn suggested with the voivode of Transylvania, the earl of Leicester, with Du Prat, provost of Paris, and with the count of Brienne, all of which came to nothing. Ultimately, on the ground that she had been lacking in respect towards the queen, Louise of Lorraine-Vaudémont, Renée was banished from the court. She married a Florentine named Antinotti, whom she stabbed in a fit of jealousy (1570); then she remarried her husband being Philip Altoviti, who in 1586 was killed in a duel by the Grand Prior Henry of Angoulême, who was himself mortally wounded.

CHÂTEAU-RENAULT, FRANÇOIS LOUIS DE ROUSELETT, MARQUIS DE (1637-1716). French admiral, was the fourth son of the third marquis of Château-Renault. The family was of Breton origin, but had been long settled near Blos. He entered the army in 1658, but in 1661 was transferred to the navy, which Louis XIV. was eager to raise to a high level of strength. After a short apprenticeship he was made captain in 1666. His early services were mostly performed in cruises against the Barbary pirates (1672). In 1673 he was named chef d'escadre, and he was promoted lieutenant général des armées navales in 1687. During the wars up to this date he had few chances of distinction, but he had been wounded in action with the pirates, and had been on a cruise to the West Indies. When war broke out between England and France after the revolution of 1688, he was in command at Brest, and was chosen to carry the troops and stores sent by the French king to the aid of James II. in Ireland. Although he was watched by Admiral Herbert (Lord Torrington, q.v.), with whom he fought an indecisive action in Bantry Bay, he executed his mission with success. Château-Renault commanded a squadron under Tourville at the battle of Beachy Head in 1690. He was with Tourville in the attack of the Smyrna convoy in 1693, and was named grand cross of the order of Saint Louis in the same year. Though in constant service, the reduced state of the French navy (owing to the financial embarrassments of the treasury) gave him few openings for fighting at sea during the rest of the war.

On the death of Tourville in 1701 he was named to the vacant post of vice-admiral of France. On the outbreak of the War of the Spanish Succession he was named for the difficult task of protecting the Spanish ships which were to bring the treasure from America. It was a duty of extreme delicacy, for the Spaniards were unwilling to obey a foreigner, and the French king was anxious that the bullion should be brought to one of his own ports, a scheme which the Spanish officials were sure to resent if they were allowed to discover what was meant. With the utmost difficulty Château-Renault was able to bring the galleons as far as Vigo, to which port he steered when he learnt that a powerful English and Dutch armament was on the Spanish coast, and had to recognize that the Spanish officers would not consent to make for a French harbour or for passages, which they thought too near France. His fleet of fifteen French and three Spanish war-ships, having under their care twelve galleons, had anchored on the 22nd of September in Vigo Bay. Obstacles, some of an official character, and others due to the poverty of the Spanish government in resources, arose to delay the landing of the treasure. There was no adequate garrison in the town, and the local militia was untrustworthy. Knowing that he would probably be attacked, Château-Renault strove to protect his fleet by means of a boom. The order to land the treasure was delayed, and until it came from Madrid nothing could be done according to the instructions which had a monopoly of the trade with America. At last the order came, and the bullion was landed under the care of the Gallician militia which was ordered to escort it to Lugo. A very large part, if not the whole, was plundered by the militiamen and the farmers whose carts had been commandeered for the service. But the bulk of the merchandise was on board of the galleons when the allied fleet appeared outside of the bay on the 22nd of October 1702. Sir George Rooke and his colleagues resolved to attack. The fleet was carrying a body of troops which had been sent out to make a landing at Cadiz, and had been beaten off. The fortifications of Vigo were weak on the sea side, and on the land side there were none. There was therefore nothing to offer a serious resistance to the allies when they landed soldiers. The fleet of twenty-four sail was steered at the boom and broke through it, while the troops turned the forts and had no difficulty in scattering the Gallician militia. The action was by the allies utterly disastrous to the French and Spaniards. Their ships were all taken or destroyed. The booty gained was far less than the allies hoped, but the damage done to the French and Spanish governments was great.

Château-Renault suffered no loss of his master's favour by his failure to save the treasure. The king considered him free from blame, and must indeed have known that the admiral had been trusted with too many secrets to make it safe to inflict a public rebuke. The Spanish government declined to give him the rank of grandee which was to have been the reward for bringing home the bullion safe. But in 1703 he was made a marshal of France, and shortly afterwards lieutenant-general of Brittany. The fight in Vigo Bay was the last piece of active service performed by Château-Renault. In 1708 on the death of his nephew he inherited the marquisate, and on the 13th of November 1716 he died in Paris. He married in 1684 Marie-Anne-Renée de la Porte, daughter and heiress of the count of Crozon. His eldest son was killed at the battle of Malaga 1704, and another, also a naval officer, was killed before Vigo. A third son, who too was a naval officer, succeeded him in the title.

A life of Château-Renault was published in 1903 by M. Calmon-Maison. There is a French as well as an English account of the part played by him at Bantry Bay and Beachy Head, and the controversy still continues. For the French history of the navy under Louis XIV. see Histoire de la France de 1643 à 1668, vol. iii.; and his Les Marins illustres (1861). Also the naval history by Charles Bouzel de la Roncière. (D. H.)

CHÂTEAURoux, MARIE ANNE DE MAILLY-NEsLE, DUCHESEE DE (1717-1744), mistress of Louis XV. of France, was the fourth daughter of Louis, marquis de Nesle, a descendant
CHATEAUROUX—CHATELAINE

of a niece of Mazarin. In 1740, upon the death of her husband, the marquis de la Tournelle, she attracted the attention of Louis XV.; and by the aid of the duc de Richelieu, who, dominated by Madame de Tencin, hoped to rule both the king and the state, she supplanted her sister, Madame de Mailly, as titular mistress in 1742. Directed by Richelieu, she tried to arouse the king, dragging him off to the armies, and negotiated the alliance with Frederick II. of Prussia, in 1744. Her political rôle, however, has been exaggerated. Her triumph after the passing disgrace provoked by the king's illness at Metz did not last long, for she died on the 8th of December 1744.

See Ed. and J. de Goncourt, La Duchesse de Châteauroux et ses sœurs (Paris, 1879).

CHATEAUVROUX, a town of central France, capital of the department of Indre, situated in a plain on the left bank of the Indre, 88 m.S. of Orleans on the main line of the Orleans railway. Pop. (1906) 21,948. The old town, close to the river, forms a nucleus round which a newer and more extensive quarter, bordered by boulevards, has grown up; the suburbs of St Christophe and Déols (q.v.) lie on the right bank of the Indre.

The principal buildings of Châteauroux are the handsome modern church of St André, in the Gothic style, and the Château Raoul, of the 14th and 15th centuries; the latter now forms part of the prefecture. The hôtel de ville contains a library and a museum which possesses a collection of paintings of the Flemish school and some interesting souvenirs of Napoleon I. A statue of General Henri Bertrand (1773–1844) stands in one of the principal squares. Châteauroux is the seat of a prefect and of a court of assizes. It has tribunals of first instance and of commerce, a board of trade-arbitrators, a branch of the Bank of France, a chamber of commerce, a lycée, a college for girls and training colleges. The manufacture of coarse woollens for military clothing and other purposes, and a state tobacco-factory, occupy large numbers of the inhabitants. Wool-spinning, iron-founding, brewing, tanning, and the manufacture of agricultural implements are also carried on. Trade is in wool, iron, grain, sheep, lithographic stone and leather. The castle from which Châteauroux takes its name was founded about the middle of the 10th century by Raoul, prince of Déols, and during the middle ages was the seat of a seigniory, which was raised to the rank of countship in 1497, and in 1616, when it was held by Henry II., prince of Condé, to that of duchy. In 1736 it returned to the crown, and was given by Louis XV. in 1744 to his mistress, Marie Anne de Mailly-Nesle, duchess of Châteauroux.

CHÂTEAUNEUF-THIERRY, a town of northern France, capital of an arrondissement in the department of Aisne, 59 m. E.N.E. of Paris on the Eastern railway to Nancy. Pop. (1906) 6872. Château-Thierry is built on rising ground on the right bank of the Marne, over which a fine stone bridge leads to the suburb of Marne. On the quay stands a marble statue erected to the memory of La Fontaine, who was born in the town in 1621; his house is still preserved in the street that bears his name. On the top of a hill are the ruins of a castle, which is said to have been built by Charles Martel for the Frankish king, Thierry IV., and is plainly the origin of the name of the town. The chief relic is a gateway flanked by massive round towers, known as the Porte Saint-Pierre. A belfry of the 15th century and the church of St Crépin of the same period are of some interest. The town is the seat of a sub-prefect and has a tribunal of first instance and a communal college. The distinctive industry is the manufacture of mathematical and musical instruments. There is trade in the white wine of the neighbourhood, and in sheep, cattle and agricultural products. Gypsum, millstone and paving-stone are quarried in the vicinity. Château-Thierry was formerly the capital of the district of Brie Pouilleuse, and received the title of duchy from Charles IX. in 1566. It was captured by the English in 1421, by Charles V. in 1544, and sacked by the Spanish in 1591. During the wars of the Fronde it was pillaged in 1652; and in the campaign of 1814 it suffered severely. On the 12th of February of the latter year the Russo-Prussian forces were beaten by Napoleon in the neighbourhood.

CHÂTELAINE (Med. Lat. castellana, from castellum, a castle), in France originally merely the equivalent of the English castellan, i.e. the commander of a castle. With the growth of the feudal system, however, the title gained in France a special significance which it never acquired in England, as implying the jurisdiction of which the castle became the centre. The châtelain was originally, in Carolingian times, an official of the count; with the development of feudalism the office became a fief, and so ultimately hereditary. In this as in other respects the châtelain was the equivalent of the viscount (q.v.); sometimes the two titles were combined, but more usually in those provinces where there were châtelains there were no viscounts, and vice versa. The title châtelain continued also to be applied to the inferior officer, or concierge châtelain, who was merely a castellan in the English sense. The power and status of châtelains necessarily varied greatly at different periods and places. Usually their rank in the feudal hierarchy was equivalent to that of the simple sire (dominus), between the baron and the chevalier; but occasionally they were great nobles with an extensive jurisdiction, as in the Low Countries (see Burgrave). This variation was most marked in the cities, where in the struggle for power that of the châtelain depended on the success with which he could assert himself against his feudal superior, lay or ecclesiastical, or, from the 12th century onwards, against the rising power of the communes. The châtelennie (castellania), jurisdiction of the châtelain, as a territorial division for certain judicial and administrative purposes, survived the disappearance of the title and office of the châtelain in France, and continued till the Revolution.

See Achille Luchaire, Manuel des institutions françaises (Paris, 1892): Du Cange, Glossarium, s. "Castellanus."

CHÂTELAINE (Fr. châtelaine, the feminine form of châtelain, a keeper of a castle), the mistress of a castle. From the custom of a châtelaine to carry the keys of the castle suspended from her girdle, the word is now applied to the collection of short chains, often worn by ladies, to which are attached various small articles of domestic and toilet use, as keys, penknife, needlecase, scissors, &c.
